Spinach.—This useful spring vegetable should be sown about the second week in September, in shallow drills one foot apart.—When up sufficiently, they should be thinned out to three inches apart in the rows. The Prickly or Winter, is the best for sowing now.

Tomatoes.—Before it gets too late, some tomatoes should be saved, and the seed obtained by washing the pulp several times in order till the seed is clean. It should then be laid in the sun to dry, and then carefully put away in brown paper, and named ready for use next spring.

It is very bad policy to save the seed at random; only the finest should be used; and those tolerably smooth and even, are the most generally prized for cooking. Similar methods should be adopted with the saving of squash, egg plant, cucumber and pepper seeds. Such seed is vastly superior to much of that purchased.—Edgar Sanders, in *Country Gent.*

Horticultural Advertisements.

200 BUSHELS PEACH STONES WANTED.

At the Ill. Hope Nurseries, Ill. Hope Avenue, Rochester, N. Y., for which the highest market price will be paid in cash. [245-4t] ELLWANGER & BARRY.

FRUIT AND ORNAMENTAL TREES.

150,000 Apple Seedlings, two years old, and good size.
34,000 *Extra* nice Dwarf Pear Trees from one to four years old, a very large portion of them White Doyenne or Virgalieu.
2,000 Horse Chestnut Trees, 7 to 9 feet high.
500 Mountain Ash, from 9 to 14 ft. high; with the usual stock of other trees, for sale at Walworth, Wayne Co., N.Y.
T. G. YEOMANS.

Also for sale, 3 very fine full blooded Suffolk Boar Pigs, four months old; 2 half-blooded do., same age—price $10 to $20. 245-3t T. G. Y.

FRUIT AND ORNAMENTAL TREES!

T. C. MAXWELL & BROS., are happy to announce a very large and very desirable stock of Fruit and Ornamental Trees, &c., for fall trade, embracing
75,000 Apple Trees—thrifty and sturdy.
15,000 Standard Pear Trees, 2 and 3 years old, healthy and fine.
25,000 Dwarf do. do. do. do.
20,000 Cherry Trees—very fine.
10,000 Peach do., one year from bud.
5,000 Apricot, Quince and Plum Trees.
Canoon's, Mammoth and other kinds Pie Plant. Also, a good variety of the small-er fruits.
1,000 Horse Chestnut Trees, 6 to 10 feet high.
6,000 Mountain Ash Trees, 6 to 10 feet high—cheap.
5,000 Balsam Fir Trees, 1 to 3 feet high—very fine.
1,000 Red Cedar Trees, 1 to 5 do. do.
Also, Norway Spruce, Hemlock Spruce, Maples, Basswood, European Lime, &c., &c.
100,000 American Arbor Vitæ, 6 to 30 inches. About 25,000 of these have grown two years in the Nursery, and are very bushy and fine;—*all are very finely rooted.* Osage Orange for Hedges, &c., &c.
The above trees were all grown on clay and gravel loams,—the best of all soils for the growth of thrifty and healthy trees.
☞ Orders promptly attended to. Packing done in the most careful and skilful manner.
Old Cattle Nurseries, Geneva, Ontario Co., N. Y., Sept. 9, 1854. } 145-6t.

WALWORTH NURSERY.—CATALOGUE.

Having been many years engaged in the Nursery business, being located in one of the best fruit growing districts of the United States, and having planted

Extensive Orchards, Embracing over 7,000 Trees!

Many of which are in bearing, I am enabled to test for myself and satisfy others of the relative value of the numerous varieties of fruits grown; I feel prepared therefore to furnish Trees, in large or small quantities, of such varieties as careful experience has shown to be the most profitable, rejecting a very large portion of those that fill up the long list in many Nursery Catalogues of the present day.

Apples.—I have grown some sixty sorts, but I now propagate mostly some fine leading market sorts, (with a choice but limited supply of earlier fruit,) viz.; Roxbury Russet, Esopus Spitzenberg, Rhode Island Greening, Northern Spy, and Baldwin, of which my orchards embrace 2,000 trees.

Pears.—Over seventy sorts have been grown by me, of which I reject about two-thirds—cultivating now principally on the Angiers Quince Stock, and of the following varieties, with a few other sorts in small quantities:—White Doyenne, Duchess de Angoulemc, Bartlet, Louise Bonne de Jersey, Beurre Diel, Dear of Winkfield, Easter Beurre, Glout Morceau, Madeline, Bloodgood, Lawrence, Dix, Flemish Beauty, Onondaga, Seckel.

My Pear Orchard consists of over 3,500 trees, 2,800 of which are White Doyenne. My Stock of Nursery Pear Trees, consists of about 20,000 trees.

Peaches.—I have cultivated and tested more than fifty sorts of Peaches; and now cultivate only about fifteen of the best, and principally of the following sorts:—Early Purple, Alberge, Orange Cling, Crawford's Early Malacoton, Crawford's Late do., Cooledge's Favorite, Newcomer, Early York, Red Check Malacoton, Pine Apple, Old Mixon Free Stone, Wells' Free. I propagate from 10,000 to 40,000 a year.

Cherries.—May Bigarreau, Knight's Early Black, Black Eagle, Black Tartarian, Elton, Yellow Spanish, Napoleon Bigarreau, Transparent Guigne, Black Heart, Bolter's Yellow, Bigarreau de Mezel.

Also:—Apricots, Grapes, Currants, Gooseberries, Raspberries, Strawberries, Apple Seedlings, Quinces, Norway Spruce, Mountain Ash, Silver Maples, European and American Balsam Fir, Horse Chestnut, Chinese and American Arborvitæ, Austrian Pine and other European Evergreens.

I propose to sell my trees at the very lowest rates, and especially low in large quantities. Buds, Scions, and Peach Stones, furnished in their season.

☞ All orders and post-paid communications will receive prompt attention. No charge for carrying packages to the Railroad. T. G. YEOMANS.
Walworth, Wayne Co., N. Y., 1854. 245-3t

SYRACUSE NURSERIES, SYRACUSE, N. Y.

The Subscribers would most respectfully call the attention of Nurserymen, Fruit Growers, Venders, &c., to their *very large* Stock of Fruit and Ornamental Trees, which they offer for sale the coming fall and spring.

We are issuing from the press:—
No. 2, A New Fruit Catalogue, which, with
No. 3, Containing the Ornamental Department, and
No. 4, The Green-house Department, will be forwarded to all pre-paid applications, enclosing a *one cent* stamp for each.

Also, a *New Wholesale* Trade List, for persons wishing to trade by the quantity.

A fresh importation of the *very best Dutch Bulbous Roots*, from Haarlem, in Holland, will be ready for delivery in September. Young trees of the following new Pears can be had of us this fall—price $1 each.

That splendid, large, early, melting pear, the *true Hosenshenk*, coming in after the *Madaline*, equalling nearly in all respects the *Virgalieu*, and *more* valuable than any other early pear.

Also, those splendid, luscious, fall pears, the *Des Nonnes* and *Beurre Charron*, first brought to notice by ourselves. These two pears much surpass the *Seckel* in size, while they fully rival it in their rich aroma, and possess the melting lusciousness of the *Belle Lucrative*.

Also, *Beurre Clairgeau* and *Kosvik*, with that fine winter pear *Beurre Bachelier*.

Syracuse, N. Y., July 15, 1854. 238-7teow

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending Sept. 5, 1854.

Wilson Ager, of Rhorsburgh, Pa., improved mill stone dress for cleaning grain.

Wm. B. Akins, of Ithaca, improvement in flour bolt.

Benj. Bray, of Salem, Mass., improvement in spring rollers for window curtains, &c.

Chas. Clarend, of New York, improvement in attaching pullers to shafts.

John Clark, of Washington, D. C., improvement in chimney caps.

Chas. H. Dunn, of West Lebanon, N. H. improvement in seed planters.

Louis Dasr, of Washington, D. C., improvement in seed planters.

Augustus M. Eastman, of New York, improvement in making ribbon of strips of cloth.

Wm. H. Foster, of Portsmouth, N. H., improved arrangement for reef and furling top sails from the deck of the vessel.

Jonathan G. Glass, of South Thomaston, Me., improvement in machinery for mooring rigging.

Gen. W. Griswold, of Carbondale, improved portable door fastener.

John Hinde, of Schenectady, improvement in machines for breaking flax and hemp.

Moses G. Hubbard, of New York, improved method of hanging piano sticks.

Admiram Kendall, of Cleveland, improved riving machine.

Jos. Morss, of Washington, D. C., improved driving wheels of locomotive for ascending inclined planes.

Thos. M. Powell, of Baltimore, improvement in ice cream freezers.

Chas. Rowland, of Belleville, Ill., improvement in bobbs.

Bradford A. Rugg and Ezra H. Benjamin, of Oak Hill, N. Y., improved machine for feeding paper to printing presses.

Daniel Warner, Jr., of South Hadley, Mass., improvement in machinery for dressing flax.

Wm. L. Wild, of Baltimore, improvement in stringed musical instruments.

Henry L. Clark, of La Porte, Ind., improvement in doors for baggage cars.

Leroy S. White, of Chicopee, assignor to himself, Lewis White, of Hartford, Lyman White, of Springfield, and Augustus G. Stevens, of Manchester, N. H., improvement in railway bunks.

Alex. H. Brown, of Georgetown, D. C., improvement in brick presses.

SMITH AND FENWICK'S FRUIT-SKINNING AND CUTTING MACHINE.

This machine, of which a cut was published in the Rural of August 12, was described as competent to pare, core and slice *three bushels* of apples in an hour. It was also asserted that "the machine was very rapidly coming into general use." This very flattering notice induced many subscribers to enquire for the machine, or where it could be obtained. After some delay we are in possession of the intelligence that "Smith & Fenwick's machines are not now made, and none are to be had. For some reason the patentees have not manufactured them to any extent."

And they are rapidly coming into general use! Why was it necessary to herald forth that announcement to the public, if "*the patentees for some reason have not manufactured them to any extent?*" The answer is left to the enquiring reader, while we beg permission to make a few brief remarks upon patented machines.

It is not only just and proper that a patent should be granted for every good and useful implement and machine that is invented, but it is also proper that the inventor and patentee should have an adequate reward for his labor. When any valuable machine has been invented and patented, the public are not slow to avail themselves of the advantages thereby offered, and thus such machines will find a steady and remunerating sale, which induces arrangements for the manufacture of enough to meet the demand. This will always be the case as a general rule. It is not to be disguised that very many machines for which patents are obtained are of very little practical value, if not indeed entirely worthless. The object in obtaining a patent for inventions of this class, is not to manufacture the goods as a source of profit, but rather to sell the rights by States, counties or towns, as they can find purchasers, then, to retire from the business with the ill-gotten gains of the speculation. We therefore generally come to the conclusion that if the rights, and not the machines, are for sale, there is little of practical value in the invention. This may not always be a correct decision, but our word for it, it will be found correct in *seven* out of every *ten* cases. We do not say this is the case with the machine in question, but if it possesses all the good qualities claimed, and is withal furnished at a reasonable price, it may come into general use without so much of preliminary advertising and puffing.

It is, as a general rule, prejudicial to the interest of any machine to have the rights sold out in small territories. We do not now think of one single patent that has been thus sold out, that has proved of any great value to any one except the person who pocketed the price paid for the right. A great error has crept into the use of patent rights, and there are good reasons why it should be corrected.

H. C. W.

Be quick in resolving, bold in executing.

SEWING MACHINES.

About five years ago we do not believe there were over three or four sewing machines in use in our country; now they can be counted by thousands. They are found in the factories and in private dwellings, sewing the coarse bag and the most delicate piece of cambric.

The machines, since they were first introduced, have advanced towards perfection with a rapidity that is truly astonishing. So many patents have already been obtained for improvements, that it is difficult to keep posted up in their progress; this is evidence of their importance, and at the same time, it is a sign that applications of them for various purposes, demand new modifications, devices and arrangements.

Application has just been made for a patent by Charles Parham, of Philadelphia, on the sewing machine, combining two threads—a shuttle and needle—the object of which is to dispense with the shuttle race, in order to obviate the friction attendant to its use, and which requiring oil to lubricate it, often soils delicate articles. He employs a shuttle carrier in which the shuttle fits, so as to allow it to pass through the loop, but requires no movement independent of the one which is given to the carrier, and which requires no fixed guide to produce friction, excepting on the side which does not come in contact with the threads.

Antimony Cannon Balls.—English papers state that experiments are being made by order of the British government, to test the effect of antimony cannon balls upon wooden surfaces. It is found that balls of this metal break upon striking the object at which they are fired, and the numerous metallic particles into which they separate are scattered in many directions, and would spread death and destruction on every side. An immediate supply of these antimony balls is to be despatched to the fleets in the Baltic and Black Seas.

Paper from Weeds.—We understand that an enterprising German is about to secure a patent for his discovery of flax, or its equivalent, in fifteen different kinds of common weeds. The discovery is to be turned to account in the manufacture of various articles of which flax is principal, but especially in the manufacture of paper, which is a matter of deep interest just now to the publishing world, the scarcity of rags being a great embarrassment to the business.—*National Intelligencer.*

Naturally formed gas has been discovered on the grounds of Mr. Robinson, near the Central Railroad depot, at Bloomington, Ill. The mouth of the well was closed, and a tube placed so as to let the gas arise. On lighting it, the flame shot up ten feet from the mouth of the tube, and burned with a clear and beautiful light. Some experiments were to be made in the use of the burning gas to generate steam, and for illuminating purposes.

Domestic Economy.

Green Tomato Pickles.—Take any size, but those ready to ripen are the best, place them in a vessel and throw on a handful of salt; cover with boiling water, and let them stand till cold; then slice them through transversely once or twice according to the size; then lay them in a crock with thin sliced onions. Prepare the vinegar with cloves, cinnamon, and allspice, and pour on hot. Cover and set away for a few days. They will be found very delicious, and will keep all winter. Those who dislike onions may omit them.

Pickled Peaches.—To one quart of good vinegar put 3 lbs. of sugar. Boil and skim it. The liquid will cover a peck of peaches; stick two or three cloves in each peach, and boil them a dozen at a time in the vinegar and sugar until they are well cooked. Take them out with a fork and place them in the jar.—When all done strain the syrup over them.

Pickled Peppers.—Take two dozen large size garden peppers, (green); slit them carefully on the side; take out the pulp; put on a table spoonful of salt, and cover them with boiling water every morning for nine days; then fill them with cabbage cut fine, and a little salt. Sew them up, then lay them in vinegar.

Recipe for Tomato Figs.—The Massachusetts Horticultural Society awarded their silver medal to Mrs. Eliza Marsh, for Tomato Figs, made as follows:

Pour boiling water over the tomatoes, in order to remove the skin; then weigh them and place them in a stone jar, with as much sugar as you have tomatoes, and let them stand two days; then pour off the syrup and boil and skim it until no scum rises. Then pour it over the tomatoes, and let them stand two days as before; then boil and skim again. After the third time they are fit to dry if the weather is good; if not, let them stand in the syrup until drying weather. Then place on large earthen plates or dishes, and put them in the sun to dry, which will take about a week, after which pack them down in small wooden boxes, with fine white sugar between every layer. Tomatoes prepared in this manner will keep for years.

Ground Rice Pudding.—Mix two and a half large spoonfuls of rice in a little cold milk; stir it into one quart of boiling milk; let it boil fifteen minutes, stirring it constantly. When cold, add five eggs; a little lemon; sugar to your taste, and bake one hour. Put a paste or not, as you prefer, on the dish.

Educational.

MAKE YOUR MARK.

In the quarries do you toil,
Do you delve upon the soil?
Make your mark
In whatever path you go,
In whatever place you stand,
Moving swift or moving slow,
With a firm and honest hand,
Make your mark.

Should opponents hedge your way,
Work by night, or work by day,
Make your mark.
Struggling manfully and well,
Let no obstacle, oppose;
None right shielded ever fell
By the weapons of his foes—
Make your mark,

What though born a peasant's son,
Good by poor men can be done—
Make your mark.
Peasant's garb may warm the cold;
Peasant's words may calm a fear!
Better far than hoarding gold
Is the drying of a tear.
Make your mark.

Life is fleeting as a shade,
Marks of some kind must be made,
Make your mark—
Make it while the arm is strong,
In the golden hours of youth;
Never, never make it wrong!
Make it with the stamp of truth;
Make your mark.

(Written for Moore's Rural New-Yorker.)

DIFFICULTIES IN SCHOOL.—NO. III.

In school, as well as elsewhere, I have found it to be true that a little matter will sometimes produce a great fire. Mr. Butler, of Kentucky, whipped a boy for transgressing a simple law in his school, and it resulted in his own cruel murder. And wherefore? Because an injudicious mother dropped a hasty word in the presence of her son. It is no new thing that the spirit from mother to child is remarkably contagious. Sometimes mothers do much more than they are aware of to promote trouble in school. They love their children, of course, and it is no very difficult thing for them to enter into their sympathies and feelings—to participate in all their childish difficulties and sorrows. But how ill qualified is the child to judge of the regulations and management of the school room; and yet, upon the judgment of the little boy or girl, the mother makes up her estimate in regard to the school and schoolmaster. From this she draws all her conclusions and regulates all her actions. Mothers have a wonderful influence in our schools, as everywhere else. Sometimes I have thought they exhibit a want of charity in some department of life—perhaps in the "department of Common Schools."

I do not think this is remarkably prevalent. Mothers have a right to be deeply interested in the education of their children, and should watch carefully their progress step by step; but they should be sure and make suitable allowances for childish passions and prejudices. Let the child know that the teacher has the sympathy of both his parents, and there will generally be very little difficulty in managing him. But should the case be otherwise, the progress of the child will be very slow and very uncertain. Mothers are slow to believe their children guilty of folly or crime, and if there is fault, would be glad to locate it somewhere else. But it is an easy thing to conceive how the "schoolmaster" may err. It is no troublesome task to settle the difficulty with the father. He is willing to listen to a fair and candid explanation of the whole matter; but with the mother it is not always so.

There is a custom of tattling, sometimes very prevalent, in our country districts which works sadly against the school and teacher. Such stories always engender prejudice and strife, and sap the foundations of all school interests. Another custom, not heretofore alluded to, works perhaps as much as any other against the real interest of the school. I mean the practice of *irregularity* so generally tolerated by parents. I have always remarked one thing in regard to the progress of scholars—the boy or girl that is punctual and steady in attending school, always makes good improvement; while on the other hand a want of regularity is always followed by backwardness and dissatisfaction. It is a very certain way to destroy interest in the mind of the child, to keep him away from school a considerable portion of the time, and especially when he is detained without any reference to the order or importance of his recitations. This difficulty exists everywhere, and is certainly a formidable one. But I have merely hinted at a few general difficulties, and the reader, especially if a teacher, will *think* of many more. At some other time I shall be glad to examine another and perhaps a more interesting branch of the subject. And I hope, as many teachers read the Rural, some of them, with permission of its editor, will publish therein some of their solitary cogitations. J. W. Barker.

Brockport, N. Y.

Disappointments derange and overcome vulgar minds. The patient and the wise, by a proper improvement, frequently make them contribute to their high advantage.

TEACHERS' INSTITUTES.

There seems to be every prospect of a revival of interest in these important institutions. Several counties have already perfected their organization, and others are only waiting the meeting of the Town Superintendents to join in the "call." It is the best way, as it is also the most regular, to have the Institute called by the Superintendents at their meeting to appoint pupils to the Normal School; but if in any case that opportunity should not be embraced, it is very easy for the Superintendent of the county town, or some other friend of education, to address a letter to the other Superintendents and secure their approbation of the Institute, which will enable the County Clerk to appoint the Advisory Committee.—Either of the above methods would answer the demands of the law, and if properly carried out, the appropriation from the State, of $60 to each county, will be secured.

The first step after the appointment of the Advisory Committee is for them to appoint a Principal, and then with him to select the lecturers and teachers to give the needed instruction, and then to devise an order of exercises for the session. Much depends upon these preliminary measures, for if they be well planned, and the labor well classified among the different teachers, order and efficiency will prevail. The course of studies and lectures should be complete and comprehensive. Especially should all the branches usually taught in schools be reviewed, and the best methods of imparting instruction in each clearly presented. Opportunity for discussion on all practical questions should be afforded—such as school classification, uniformity of text books, modes of keeping order, and of securing regular attendance and close application to study, prizes, &c., &c. There should be some evening lectures on general education, showing the relations that exist between society and schools—between parents and teachers—superintendents and school districts,—as also the duties devolving upon all who are connected in any way with the educational interests of the people. The subjects of physiology, philosophy, chemistry, geology, &c., might be dwelt upon at least enough to give general ideas and awaken an interest in studies of that kind. Such an interest will do much to elevate the aspirations of teachers, and consequently cause them to be more energetic and enthusiastic in their efforts to "train up the child in the way he should go." The subject of music should be embraced in the order of daily exercises.

As soon as lecturers and teachers have been agreed upon, the announcement should be made through the county papers, and bills freely posted throughout the entire county. If this be judiciously done, the attendance cannot fail to be prompt and full.

Several gentlemen have already signified their willingness to take charge of Institutes, and where counties desire conductors or lecturers from abroad, they can have references given by addressing the State Agent (James Johonnot, of Syracuse,) or the State Superintendent at Albany.

In case no call of the Town Superintendents can be secured for an Institute, the teachers should get up one by their own contributions. There never was more need of such instrumentalities as Institutes than at the present, nor were there ever such facilities for holding them. The State Agent will devote the entire season to them, and the State Superintendent will render all the aid in his power to give them interest and utility.

Fellow workers! let us be up and doing.—During the months of September, October and November, there should be an Institute in every county in the State. There should be a general awakening of the almost dormant energies of our schools, so that progress—sure and permanent progress—shall be realized.

P. S.—Will every Advisory Committee notify the Superintendent of Public Instruction as to the time and place of holding their Institute?—T. H. B., in *New York Teacher*.

CHILDREN NOT TAUGHT TO THINK ENOUGH.

Study, and the means of study, are indispensable; but all study and no reflection will never make a scholar. A man may read a monument of books, and never know the more; because knowing but little of all, he knows nothing definite of a part. So with the children.—They should obtain a faculty of reflection.—Moderate study, and rigid, scrutinizing, untiring thought, will bring a child any sufficient knowledge. Who is the successful man? He who thinks. Who is the distinguished professional man? He who reflects and investigates. And who the enviable scholar? The book-worm. Ask Newton with his apple, Watt with his engine, or Franklin and Morse with the kite and lightning, and they will tell you, as all history portrays, that knowledge comes only after close, vigilant thought. Show me that boy who is reserved, thoughtful and inquisitive, and when he comes to manhood I will point out to you an intellect; or the girl who sees beauty in nature, and admires nature for its beauty and instruction, and I will show you a store of intellectual brightness.

Catholics and Common Schools.—The Cleveland Leader says that the Catholic editor of the Chicago Tablet, in a lecture delivered at Joliet, Ill., expressed the following opinion of common schools: "The common schools of America are fountains of prostitution and crime, and all manner of indecencies and immoralities are practiced in them. I know it to be so, because I was educated the first twenty years of my life in them!"

Error.—Error is like that genius in the Arabian Nights, who, though his bulk, when unconfined, reached from earth to heaven, could yet squeeze himself into the compass of a quart pot. It is surprising from what small beginnings most monsters grow.

A cheerful temper, a kindly heart, and a courteous tongue, cannot be too sedulously cultivated.

Useful Olio.

MOSSES.

In the vegetable as in the animal kingdom, there are descending grades of organic development, until the final limit terminates at the point where inorganic matter begins; or perhaps more properly reversing the order, the first developments of vegetable organic life commence and inorganic matter end, where it is difficult to determine to which kingdom the dividing subject properly belongs.

Among the lower orders of the vegetable creation may be reckoned the Mosses, two of which, the Pear-Shaped Moss, and the Broad-Leafed Scale Moss, are represented in a magnified form by the accompanying illustrations.

Fig. 1.—The Pear-shaped Moss.

The former (fig. 1) is frequent in moist shady spots in limestone districts, and is selected as illustrative of the highly cellular structure of this tribe of plants. The latter (fig. 2) is found on moist heaths, and in damp woods and thickets, and especially by the side of wells and rivulets.

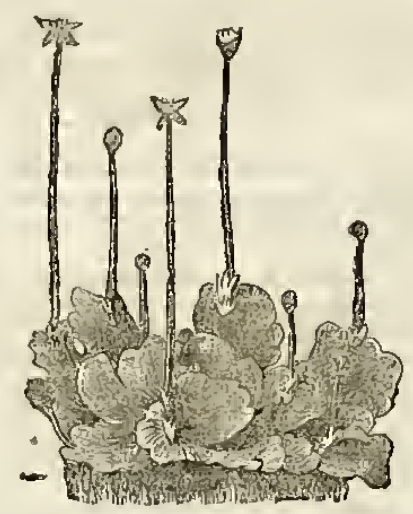

Fig. 2.—The Broad-leafed Scale-Moss.

Sowerby says, speaking of the Mosses: "It is chiefly in the economy of nature that we must look for the utility of these little plants, that she has fashioned with so much care, and for the reproduction and dissemination of which she has invented so beautiful and complicated an apparatus, though they are destined for the most part to flourish where no human eye beholds that beauty, no intelligence, save her own, can calculate the necessity and advantage of their existence. Their ministry is pursued in concert with other families still lower in the scale of vegetable being; the smaller species assisting in the production of soil upon newly formed lands, clothing with verdure the most barren spots, and gradually fitting them for the support of the higher order of plants; while the larger are occupied in no small degree in the production of land itself, especially the aquatic kinds, which fix themselves upon the surface of lakes and stagnant waters, already interlaced with the slender stems of the *Charæ Confervæ*, and plants of similar habit, gradually converting the liquid plain into a partially solid one, on which eventually grasses, rushes, &c., are capable of growing; thus are formed morasses, which, by a further progress of vegetation, become at length fertile meadows. While thus slowly operating to increase the extent of the habitable world, their influence directly and indirectly affects in various ways, but more frequently, perhaps, unseen and unsuspected, the welfare and interest of those who are too apt to despise their apparent insignificance, and too prone to stoop to the examination of their surpassing beauty. Of the species which render their feeble aid in thus converting water into land, are some of the little frondose Scale Mosses."

Heaven is a day without a cloud to darken it, and without a night to end it.

THE WOLF NURSES IN INDIA.

The wolf in India is looked upon, as it formerly was in northern Europe, as a sacred animal. Almost all Hindoos have a superstitious dread of destroying or even injuring it; and a village community, within the boundary of whose lands a drop of wolf's blood has fallen believes itself doomed to destruction. The natural consequence is, that in the districts less frequented by Europeans, these animals are very numerous and destructive, and great numbers of children are constantly carried off by them. Only one class of the population—the very lowest, leading a vagrant life and pronouncing among among the jungles—will attempt to kill or catch them. Even these, however, although they have no superstitious fear of the wolf, and always found to be well acquainted with its usual dens and haunts, very seldom attempt its capture; in all probability from the profits they make of the gold and silver bracelets and necklaces worn by the children whom the wolves have carried to their dens, and whose remains are left at the entrance. In all parts of India, it appears, numbers of children are daily murdered for the sake of these dangerous ornaments.

The wolf, however, is sometimes kinder than man. In the neighborhood of Sultanpoor, and among the ravines that intersect the banks of the Goomtee river, this animal abounds; and our first instance of a "wolf nurse" occurs in that district. A trooper, passing along the river bank near Chandour, saw a large female wolf leave her den, followed by three whelps and a little boy. The boy went on all fours, apparently on the best possible terms with his companions, and the wolf protected him with as much care as if he had been one of her own whelps. All went down to the river and drank, without noticing the trooper, who, as they were about to turn back, pushed on in order to secure the boy. But the ground was uneven, and his horse could not overtake them. All re-entered the den; and the trooper then assembled some people from Chandour, with pickaxes, who dug into the den for about six or eight feet, when the old wolf bolted, followed by her three cubs and the boy. The trooper, accompanied by the fleetest young men of the party, mounted and pursued; and having at last headed them, he turned the whelps and the boy (who ran quite as fast) back upon the men on foot. They secured the boy and allowed the others to escape.

The boy thus taken was apparently about nine or ten years old, and had all the habits of a wild animal. On his way to Chandour he struggled hard to rush into every hole or den he passed. The sight of a grown-up person alarmed him, and he tried to steal away; but he rushed at a child with a fierce snarl, like that of a dog, and tried to bite it. Cooked meat he would not eat, but he seized raw food with eagerness, putting it on the ground under his hands, and devouring it with evident pleasure. He growled angrily if any one approached him while eating, but made no objection to a dog's coming near and sharing his food. The trooper left him in charge of the Rajah of Husunpoor, who saw the boy immediately after he was taken. Very soon after he was sent by the Rajah's order to Captain Nicholetti's at Sultanpoor; for, although his parents are said to have recognized him when first captured, they abandoned him on finding that he displayed more of the wolf's than of human nature.

He lived in the charge of Captain Nicholetti's servants nearly three years, very inoffensive, except when teased, but still a complete animal. He could never be induced to keep on any kind of clothing, even in the coldest of weather; and, on one occasion, tore to pieces a quilt, stuffed with cotton, and ate a portion of it, cotton and all, every day with his bread. When his food was placed at a distance from him, he ran to it on all fours, like a wolf, and it was only on rare occasions that he walked upright. Human beings he always shunned, and never willingly remained near them. On the other hand, he seemed fond of dogs and jackals, and, indeed, all animals, and readily allowed them to feed with him. He was never known to laugh or smile, and was never heard to speak until within a few minutes of his death, when he put his hands to his head and said it ached, and asked for water, which he drank and died.—*English paper.*

THE ECHO.

A little boy, whose name was George, as yet knew nothing of the echo. On one occasion, when left alone in a meadow, he cried out loudly, "O! O!" when he was directly answered from the hill close by, "O! O!" Surprised to hear a voice without seeing any person, he cried out, "Who are you?" The voice replied, "Who are you?" He then screamed out, "You are a silly fellow," and "silly fellow" was answered from the hill.

This only made George more angry, and he went on calling the person, whom he thought he heard, nicknames, which were all repeated exactly as he uttered them. He then went to look for the boy, in order to strike him, but he could find no one. So he ran home, and told his mother an impudent fellow hid himself behind the trees on the hill, and called him nicknames. Having explained to his mother what had taken place, she said to him, "George, my boy, you have deceived yourself. You have heard nothing but the echo of your own words; if you had called out a civil word towards the hill, a civil word would have been given back in return." "O!" said George, "I will go down to-morrow and say good words, and get good words from the echo."

"So it is," said George's mother, "in life, with boys and girls, and men and women. A good word generally produces a good word; or, as the wise man said, "a soft answer turneth away wrath." If we smile on the world, the world will smile on us; if we give frowns, we shall have frowns in return. If we are uncivil or unkind towards others, we cannot expect anything better of them in payment.

Money does not always make the man.

Sunday Reading.

ST. HELENA.

BY MARY J. CROSSMAN.

The spirit of my fancy
Oft lingers fondly with thee, child of Ocean!
Within thy bosom there have rested from
Life's din and strife, the earth-immortal and
The heaven-renowned. Thy walls of adamant,
Long lashed by fireless surges of the sea,
Have given safe watchguard to a foreign trust,—
"The sleeping fires of goodness and of crime."

Proud conqueror of the East! 'twas thine to fan
The glimmerings of war's red torch, until
Night was no longer night, and nations met
Upon the crimson tide of human woe.
Ambition's most unhallowed fires were kindled
Within thy soul, till on the fearful ruins
Of happy homes, of wasted mirth, of crushed
And bleeding hearts, uprose the glittering fane
Of self-aggrandizement;—and in its light,
The fadeless laurel on the victor's brow
Was placed; yet in the cup of worldly weal,
Was more of bitterness than nectar found.
Prometheus-like was Heaven's own genius-fire
To godless purpose given—hence its reward.

Spirit of light! heir of immortal joy!
A glorious guerdon hath thine earth-toils won.
That seed of heavenly origin, 'mid earth's
Dark places sown, warmed by celestial rays,
Hath burst its bonds triumphantly: Bermahs'
Benighted sons, from proud Pagodas torn
To Calvary's cross; from idle worshipping at
Gautama's shrine, to Him whose praises wake
Angelic lyres to higher, holier notes.
Oh, laborer thrice blest! whose hand hath sown,—
Hath reaped immortal seed:—yea, more;
Hath pressed the spring, that moves angelic hosts
To loftier praises of redemption's theme.
Isle of undying fame! O, tell me whose
The brighter path; whose is the higher meed!
The veteran warrior's, or the teacher's wife.

(Written for the Rural New-Yorker.)

SABBATH MUSINGS.

Oh! how calm, how beautiful this Sabbath morning. How well calculated to inspire the heart with love and gratitude to our Maker, with thoughts of the pure and good, and to recall to the mind bright and golden recollections of the past.

How charmingly has nature adorned this lovely retreat in which I sit, and as I gaze with admiration on the beauties around me, sweet, yet sad memories of the past linger around my heart, like a cloud on a bright summer day; memories of a gentle, departed friend, an associate from childhood, a being that none could know without loving.

But one short year ago, another, as bright and beautiful a morning as this, found me at this loved spot, reclining on this same mossy couch, the tall trees, with their luxuriant foliage, gently waving over my head, and upon whose widely extended branches the merry songsters rested, and carolled forth the sweetest notes of praise to their Creator; the same brilliant display of flowers were scattered in profusion at my feet as now; and then a being with a heart so good and pure as to charm all, was here to admire with me the beautiful things which God in his infinite wisdom has placed upon earth for the pleasure and benefit of man. But now no form, no gentle voice like hers awaits me here, as of old, for her pure spirit has taken its departure to its long home; to that land of rest where pain, sorrow and anguish of heart are unknown, where all is joy and happiness complete, and far away behind yonder beautiful hills, her clay tenement quietly reposes beneath the shade of the willow.—But why should we mourn her loss? He that "ruleth all things" hath taken her to dwell with Him forever. Happy—happy thought! that there is a place where the weary spirit can find rest, where *all* who repent of their sins and come unto Him, shall, when their spirit quits its earthly tabernacle, dwell in a place of eternal rest and happiness. Nellie.

Maple Vale, 1854.

HEAVEN.

Whittier, speaking of Heaven, says:—"We naturally enough transfer to our idea of heaven whatever we like and reverence on earth."—Thither the Catholic carries on, in his fancy, the imposing rites and time-honored solemnities of his worship. There the Methodist sees his love-feasts and camp meetings, in the green pastures of the Blessed Abode. The Quaker in the stillness of his self-communion remembers that there was silence in heaven.—The churchman listening to the solemn chant of vocal music, or the deep tones of the organ, thinks of the songs of the elders, and the golden harps of the New Jerusalem.

The heaven of the northern nations of Europe, was a gross and sensual reflection of the earthly life of a barbarous and brutal people.

The Indians of North America had a vague notion of a sunset land—a beautiful paradise far in the west—mountains and forests filled with deer and buffalo—lakes and streams swarming with fishes—the happy hunting ground of the souls.

A venerable New England clergyman on his death-bed, just before the close of his life, declared that he was only conscious of an awfully solemn and intense curiosity to know the great secret of death and eternity.

Yet we should not forget that "the kingdom of heaven is within;" that it is the state of the affections of the soul; the sense of harmony with God; a condition of time and eternity.

Miscellaneous.

IN THE MEADOWS.

BY BAYARD TAYLOR.

I lie in the Summer meadows,
In the meadows all alone,
With the infinite sky above me
And the sun on his mid-day throne.

The smell of the flowering grasses
Is sweeter than any rose,
And a million happy insects
Sing in the warm repose.

The mother lark that is brooding
Feels the sun upon her wings,
And the deeps of the noon-day glitter
With swarms of fairy wings.

From the billowy green beneath me
To the fathomless blue above,
The creatures of God are happy
In the warmth of their Summer love.

The infinite bliss of Nature
I feel in every vein;
The light and the life of Summer
Blossom in heart and brain.

But darker than any shadow
By thunder-clouds unfurled,
The awful truth arises,
That Death is in the World!

And the sky may beam as ever,
And never a cloud be curled,
And the air be living odors,
But Death is in the World,

Out of the deeps of sunshine
The invisible bell is hurled;
There's Life in the Summer meadows,
But Death is in the World!

—*N. Y. Tribune.*

ANCESTRAL HONORS.

In an aristocratic community like that of England, where titles and estates are retained in perpetual descent, where the eldest son by right of birth succeeds to all the honors and emoluments of the father, and the younger sons, through the powerful influence of family and connections, are provided for in the army, the navy, and the established church, it is quite natural that a record of birth and descent should be carefully preserved back even to the remotest times. It not unfrequently happens that a collateral branch of the family, by reason of a failure of the direct line, comes into possession of immense estates, and is lifted at once by the lucky circumstance of relationship to a nobleman, from comparative indigence to a peerage and a seat in the House of Lords.

These circumstances quite naturally generate a pride of ancestry, and cause an individual not unfrequently to hold ancestral honors in higher esteem than his own intellectual and moral attributes; to deem a descent from one of the robber chiefs who accompanied WILLIAM THE CONQUEROR from Normandy, and gained possession of estates by rapine, violence, and bloodshed, of more importance than an honorable and blameless life; to esteem an escutcheon unsullied by intermingling with plebian blood superior to unspotted integrity and lofty patriotism. The son of a peer, blessed with neither beauty of person, brilliance of intellect, nor purity of life, is much inclined to look down with lofty contempt upon the son of a yeoman, who possesses all these attributes.

The folly of such sentiments, and the radical defects of a government the institutions of which tend to cherish such a state of feeling, need no reprobation here. Our own fundamental law repudiates all titles of nobility frowns upon all ancestral distinctions, and, in theory at least, places the son of the humblest citizen on the same footing with the son of the most distinguished. It is true that social position, access to refined society, and all the superior advantages of wealth and station, give the latter facilities for intellectual culture, confidence, and grace, which the former cannot possess; but it is equally true that all these advantages are not unfrequently thrown away, and the garden of the heart permitted to become choked up with every kind of rank and poisonous weed; while the primitive but strong soil of the former brings forth an abundant and glorious harvest. In the one case the genuine and beautiful pearl is melted away and dissolved in a bacchanalian cup, while in the other the rough diamond which the shifting sands of life polish up, emits a light glorious as the sun.

The brightest ornaments of the church, the most distinguished literary men, the best teachers, orators, statesmen, artists, artisans and agriculturists of this country are men of humble origin; while many of the most notorious debauchees, gamblers, drunkards, and villains of every hue, are men who, having nothing to boast of themselves, pride themselves upon their honorable connections or descent. This is not of necessity the case, for children innumerable live and die in the same vale of poverty and ignorance as their parents before them; while many sons of men in high position rise superior even to their parents. The ebb and flow of the tide of human life, alternately lifting men to the crest of the wave and then sinking them to the lowest level, demonstrates the folly of resting claims for consideration upon ancestral honors; for the son of a peasant may become President, while the son of a President may become a pauper; the son of the most illiterate parent may, by aid of our glorious facilities for acquiring knowledge, become one of the magi; while the son of the most distinguished scholar may possess an intellect clouded and obscure. The ancestor of one of the signers of the Declaration of Independence may have been for aught we know a transported convict, while the descendant of another may at this moment be the inmate of a State prison.

"Honor and Shame from no condition rise,
Act well your part; 'tis there true honor lies."

THE TESTIMONY OF AN HONEST HEART.

The following touching extract from a letter written by a sailor in the Baltic fleet, to his wife in England, illustrates forcibly the wickedness and horrors of war, and shows up in glaring colors, the wrong of compelling men, without the slightest shadow of personal hostility, to shed each others' blood. Oh! war—war, when shall we be permitted to chronicle the end of thy misdoings!

"Every man on board volunteered, so the Captain picked a crew, and I was sent ashore with the marines. There were regular troops on the bank who fired on us as we pulled to land, but the broadsides of the ——, what with the shell and what with the smoke, covered our landing. We dispersed at a few hundred yards distance from the beach, to keep the coast clear, while the boat's crew made prizes of the guns. The enemy had the advantage of the wood, and also knowing the country well, and a troop of them showed in advance. We were ordered to fire. I took steady aim, and fired on my man at about 60 yards. He fell like a stone.

"At the same time a broadside from the —— went in among the trees, and the enemy disappeared, we could scarcely tell how. I felt as though I must go up to him, to see whether he was dead or alive. He lay quite still, and I was more afraid of him lying so than when he stood facing me a few minutes before. It's a strange feeling to come over you all at once, that you have killed a man.

"He had unbuttoned his jacket, and pressing his hand over the front of his chest, where the wound was. He breathed hard, and the blood poured from the wound and also from his mouth every breath he took. His face was white as death, and his eyes looked so big and bright as he turned them and stared at me; I shall never forget it. He was a fine young fellow, not more than five and twenty. I was down on my knees beside him, and my breast was so full, as though my own heart would burst. He had a real English face, and did not look like an enemy.

"What I felt I can never tell, but if my life would have saved his, I believe I should have given it. I laid his head upon my knee, and he grasped hold of my hand, and tried to speak, but his voice was gone. I could not tell a word he said, and every time he tried to speak the blood poured out so, I knew it would soon be over. I am not ashamed to say that I was worse than he, for he never shed a tear, and I couldn't help it. His eyes were closing, when a gun was fired from the —— to order us aboard, and that aroused him. He pointed to the beach, where the boat was just pushing off with the guns we had taken, and where our marines were waiting to man the second boat, and then he pointed to the wood where the enemy was concealed. Poor fellow! he little thought how I had shot him down. I was wondering how I could leave him to die, and no one near him, when he had something like a convulsion, for a moment, and then his face rolled over, and, without a sigh, he was gone. I trust the Almighty has received his soul. I laid his head gently down on the grass, and left him for the last time; I somehow thought of everything I had heard about the Turks and the Russians, and the rest of them; but all that seemed so far off, and the dead man so near."

THE STORY OF CINDERELLA.

The origin of this nursery tale is thus given by a French journalist. We "tell the tale" as told to us, but it is probably of much greater antiquity. About the year 1730, an actor of equal talent and wealth named Thorenard, in passing through the streets of Paris, observed upon a cobbler's stall, the shoe of a female, which struck him by the remarkable smallness of its size. After admiring it for some time, he returned to his house; but his thoughts reverted to the shoe with such intensity, that he reappeared at the stall the next day; but the cobbler could give him no other clue to the owner, than that it had been left in his absence, for the purpose of being repaired.

Day after day did Thorenard return to his post to watch the re-integration of the slipper which proceeded slowly; nor did the proprietor appear to claim it. Although he had completed the sixtieth year of his age, so extravagant became his passion for the unknown one, that he became (were it possible for a Frenchman of that day to be so) melancholy and miserable. His pain was, however, somewhat appeased by the avatar of the little foot itself, appertaining to a pretty and youthful girl in the very humblest class of life. All distinctions were leveled at once by love: the actor sought the parents of the female, procured their consent to the match, and actually made her his wife.

The Crooked.—Have you noticed that tree in the corner of the yard? When very young it was bent down to the earth and imbedded there. It then shot up again, but it is now forever deformed. The sun may shine, the dew and the rain may fall, but the tree will never be straight. So bad habits, once fixed, are hard things to root out.

To be contemptible, is, in the world's estimation, almost worse than to be an offender—to be mocked at, than to be denounced.

Ladies' Department.

CONDUCTED BY A——E.

MY WIFIE'S BACK AGAIN.

AIR: "WHISTLE O'ER THE LAVE O'T."

Short syne I had na heart to sing;
My harp unstrung nae music wad ring;
Noo I've got back the master string,
An' music I can mak again:
The weariest night, it ends wi' morn,
The longest hoe at last will turn;
An' now I sing, nae mair forlorn—
My winsome wifie's back again!

Long days an' nights passed owre in gloom;
I thought the simmer ne'er wad come;
But noo, at care I snap my thumb,
An'-cauty I can crack again.
Noo simmer smiles; blythe sing the birds;
The bairns o' joy strike a' the chords;
An' I—oh! what needs wastin' words—
My dearly dear is back again!

O man! without a wifie's care,
Be your house fu', or be it bare,
There's something wantin' late an' air,
To fill your heart an' make you fain.
Your selfish life's a lonesome spirit;
But wifie's smile, in pain or health,
Steals woe from want, or blesses wealth—
Thank Heaven! my wifie's back again!

—*Knickerbocker.*

Trans-Atlantic Epistles,

TO COUSIN KATEY.

Communicated thro' Moore's Rural New-Yorker.

EPISTLE ELEVENTH.

English Nobleman—Different modes of traveling—Number of strangers in Rome during Holy Week—the Corso—Dress required for admittance to reserved places in St. Peter's—*Impromptu dress coat*—Uniform of the Swiss Guard—Rush to the "Apostles' Table"—Extravagant prices at Hotels—Restaurants—Italian cookery—Zuppa Inglesa—Why so called.

Dear Cousin Katey:—Have I told you in any of my rambling letters, that we had the honor of traveling from Civita Vecchia to Rome in the same carriage with a genuine *live* English nobleman? Even so, Katey, and I hasten to explain the circumstance, which doubtless excites your republican astonishment to the highest degree. The steamer arrived at Civita Vecchia late Saturday night. The passengers landed Sunday morning, and, of the whole company, the English lord and ourselves were the only ones who saw fit to remain at Civita Vecchia over the Sabbath, instead of proceeding at once to Rome. We made acquaintance at the dinner table, and the next morning took a carriage together for Rome.—Thus came it to pass that an insignificant individual like your cousin Minnie was brought into contact with one of the scions of old England's aristocracy. But you are perhaps curious to know something of the personage in question. His lordship was a young man, accompanied by a Mentor in the shape of a clever, good-humored clergyman, and his suite was completed by a Swiss courier, an appendage which most travelers take with them, and whose province it is to see that his master is fleeced according to rule, and not in any manner which custom has not sanctioned. Dame Nature had treated our nobleman most cavalierly, for he was, without exception, the ugliest mortal I ever beheld, not so much from deformity of feature, as from a gross, animal expression, and his mental horizon was, to say the least, exceedingly limited. He seemed quite a connoisseur in matters that concerned the table, delivered his opinion in a magisterial tone respecting every dish which he tasted, and, when he learned that we were Americans, was quite minute in his inquiries respecting the facilities for *fishing* which our country affords, but further than this, the range of his ideas apparently did not extend. However, to make amends for such slight deficiencies as lack of personal charms and mental endowments, he has, or will have an income of 25,000 pounds sterling per annum, and will probably find no difficulty in persuading some one of England's fair and titled daughters to take upon herself the promise to "love, honor and obey."

The English are pre-eminently a traveling nation. Americans possess some claims to this appellation, but there is an essential difference in the mode of traveling adopted by solid, sensible John Bull, and that which suits the enterprising notions of Brother Jonathan.—The Englishman spends months, seasons, even years in foreign lands. He travels with his wife, his children, his servants, his carriage, and in fact, takes home along with him. And you are not to suppose, Katey, that these travelers are all grand *seigneurs*, with incomes so immense that they know not what to do with them. On the contrary, motives of economy not unfrequently lie at the bottom of this arrangement, for the cost of keeping up an establishment in England is so great, particularly where there are children to be educated that a family can often make a leisurely tour through the continent, stopping for several months in the principal cities, spending the summer on the Rhine, and the winter in Italy, at less expense than they could have lived respectably at home in the mean time.

But the lively, dashing Yankee does not travel after any such fashion. He rushes from one city to another as fast as steam can carry him, which, by the way, is not fast enough in this country to suit one accustomed to the rapid movements of our magnificent steamboats, or the lightning rapidity of our express trains—he walks through the Museums, bestowing little more than a hasty glance upon the most famous works of art—the churches he pronounces a bore—the paintings he is tired to death of—the Swiss mountains and lakes please him, for they have much analogy with some portions of his own land, but there are no steamboats, no railroads, and scarcely a stage route there, and after "doing up" the whole of Europe in three months, he steams home with the conviction that America cannot be beat, and that foreign travel is a humbug. An individual of this stamp crossed our track during our Italian tour, and in little more than a week's time we encountered him again, something as a restless comet dashes in and out of the orbits of more quiet, regular stars. But during these few days he had visited Rome, Leghorn, Pisa, Florence, Genoa, Turin, Milan and Venice.

On one of the lakes in Switzerland we fell in with two young gentlemen from New York, who were traveling in a manner nearly as expeditious, and at the same time getting a good knowledge of the objects they saw, but it was by dint of hard labor. Much of their traveling was done at night, they had a courier to make all their arrangements for them, and every moment of leisure was devoted to "reading up" in Murray, who, you must know, is the author of a set of guide books, which hold the same rank among similar publications that Murray's Grammar formerly did among grammars. Besides all this, they took notes of their travels, and were in reality very well posted up, but their's was anything but a pleasure trip. I dare say they never worked so hard before in their lives.

Rome is full of strangers during Holy Week. There were not far from two hundred Americans ladies there this year, and the English were in still greater numbers. The Corso, the principal street in Rome, was a brilliant sight of an afternoon, being filled with a constant succession of elegant carriages, drawn by shining jet black horses, and occupied by richly attired ladies, while here and there the magnificent equipage of a cardinal, glowing with crimson and gold, gave variety to the scene. It is a singular custom which the Roman nobles have, and which strangers soon fall into, of riding from one end of the Corso to the other, and then back again, for hours together, the horses scarcely leaving a foot pace the whole time.—It resembles more an immense procession than persons riding for pleasure, and one can hardly imagine any amusement in it, unless it be that of seeing and being seen.

During Holy Week there are temporary seats erected in St. Peters for the accommodation of ladies who wish to see the ceremonies. These, as might be expected, are filled to a great extent by the strangers in Rome, who obtain tickets for this purpose from their ambassadors.—Gentlemen are allowed to enter the tribune, or that part of the church behind the altar where the Pope himself is seated, but ladies are not permitted to approach so near his sacred person. This distinction between the two sexes is made still more prominent in the Sixtine chapel. Here an iron grating is placed near the middle of the apartment, dividing it into two sections, an inner and an outer. Ladies are not allowed to penetrate into the inner one, where are the Pope and Cardinals, but gentlemen pass in and out freely. There is, however, a curious condition attached to these privileges. Gentlemen must be in uniform, if military characters, if simple citizens, must wear a "habit a la Francaise," or dress coat. Ladies must be attired in black, with a black veil, or black head dress of some kind instead of a bonnet. An ingenious young gentleman of my acquaintance, finding himself unable to comply literally with the terms of the requirements, made the nearest approach to it he could by pinning up the skirts of his frock coat in such a way as to produce a very tolerable imitation of a dress coat. The Swiss Guards who stood at the entrance of the tribune, examined him narrowly, and one of them even raised the skirts of his coat and looked under. They were evidently aware of the *ruse*, but as the external configuration of the garment was that of a dress coat, they did not feel at liberty to refuse him, and he was accordingly allowed to pass, while a white-haired, well-dressed, fine looking gentleman coming up soon after in an *undisguised* frock coat, was rejected without mercy.

Speaking of dress, I must tell you something of the costume of these same Swiss guards, which is as fantastic as that of a harlequin fresh from the stage. It is attributed to Michael Angelo, like many other things, good, bad and indifferent, which have need of the sanction of some great name to support them. The truth probably is that it was copied from ancient Swiss costumes. We afterwards saw historical pictures in Switzerland which contained personages similarly attired. But to give you an idea of it—the whole dress is composed of stripes, red, black and yellow, extending longitudinally, and varying in width to suit the form. These stripes are not always attached to each other, but in some places are entirely independent of each other, and the rest of the garment. For example, the trousers are full, and extend just below the knee, where the stockings meet them. They are black, and the stripes of red and yellow placed over them are attached only at the two extremities, while the middle part plays loosely with every motion of the limb. The sleeves are also full from the shoulder to the elbow, and are arranged in the same manner. Add to this a crested helmet, a formidable looking halberd, a steel cuirass for state occasions, stockings, one red, the other yellow, buckled shoes, and all this motley attire displayed upon a broad-shouldered, powerful man, and you have a faint picture of the Pope's Swiss guards. They are a faithful, trusty set of men, and serve their master well, but they are not in much favor among the people, whom they sometimes treat rather rudely when curiosity leads them to trespass beyond the bounds assigned them.

On the day that the Pope served the apostles at table there was the greatest rush to see this ceremony that I ever beheld. The hall where the table was placed was not large enough to hold one-tenth part of the spectators, the entrance was narrow, and altogether the scene resembled more the auctions in which tickets for Jenny Lind's concerts were sold, than the preparations for a religious ceremony. I became entangled in the crowd before I was aware of it, and really feared I should never get out of it without losing life or limb. One lady was actually thrown down, and if she had not been instantly snatched up and withdrawn to a place of safety by one of the Swiss guards, she would doubtless have been severely, if not fatally injured.

Hotels, as might be supposed, are thronged at this season of the year. There are several very fine ones in Rome, but the prices are extravagant, almost beyond belief. An American gentleman and his son, who staid six days in one of these hotels, paid on their departure a bill of 84 dollars, and that too without having indulged in expensive extras. The better way, at least for those with whom economy is any object, is to take furnished apartments, which can be procured at prices not very exhorbitant, and have one's meals sent in from a restaurant. They are brought in a tin box, about the size and shape of a large trunk, and in one corner is an apparatus, with charcoal burning in it, which keeps the dishes warm till they are used. Rome does not possess a good restaurant, I mean one nicely furnished, and well arranged. Many of the restaurants are kept in the hall of some old palace, where the tarnished giltings and frozen paintings dimmed with smoke, tell of grandeur in decay, while the dark, dusty corners are suggestive of anything but agreeable ideas to those who have been accustomed to frequent Taylor's magnificent establishment, or the gorgeous saloons of Paris.

Italian cookery, as you perhaps know, Cousin Katey, is not held in very high estimation by foreigners. One peculiarity of it is that almost everything is fried in oil. Fish, flesh and fowl, all go through the same *fry-ey* ordeal. Great use is also made of cheese. When soup is served a plate of grated cheese is always added, one or more spoonfuls of which are to be stirred into each dish of soup as a condiment.—One dish made use of here is rather singularly named. It is called "*Zuppa Inglesa*," or English soup, and what do you fancy it is?—Something liquid, doubtless, as I did, when attracted by the name I first called for it. But what was my astonishment to find it composed of alternate layers of cake and custard, the whole strongly saturated with brandy. I have eaten the same thing at home under the title of "*Tipsy Parson*." The Italians have probably christened it "*English* soup" on account of the penchant which this nation exhibits for the liquor with which it is flavored. As a further illustration of the prevalence of this taste, even in the highest and most respectable classes of English society, let me mention that the clergyman who accompanied the young nobleman I have already mentioned, was provided with his bottle of Cognac, to which he made frequent visits, and which he politely placed at my service, even urging it upon me, as I was complaining of a slight indisposition. But enough of this gossip.

Your affectionate cousin, Minnie.

A Safe Hiding Place.—A noble lady, who, being asked where her husband was, when he lay concealed for having been deeply concerned in a conspiracy, resolutely answered, "I have hid him." This frank confession drew her before the king, who told her, nothing but discovering where her lord was concealed could save her from torture. "And will that do, sir?" said the lady. The king replied that he had given his word for it. "Then," says she, "*I have hid him in my heart*—there you'll find him." The noble answer charmed her enemies, and turned aside the king's resentment.

This may be said of love, that if you strike it out of the soul, life would be insipid, and our being but half animated.

MOORE'S RURAL NEW-YORKER

ROCHESTER, SEPTEMBER 23, 1854.

Prospective Prices for Breadstuffs.

The commercial papers East and West seem to entertain the nearly unanimous opinion that the extreme high prices of breadstuffs which have been ruling for many months past cannot be maintained for a great length of time to come. With the advent of abundant rains which have recently fallen all over the country, has disappeared much of the panic in regard to the crops; and the sober second thought of the people recognizes a greater supply of grain than was at first anticipated. The streams have commenced rising so as to enable the millers to enter upon a career of increased activity, and the forwarders to send on the flour towards the sea board. This increase of supply will tend to reduce the price of flour, and as a consequence also the market value of the grain.

Again, the harvest in Europe is coming in abundantly, and the weather, according to last accounts, is most favorable for securing the crop. California, which heretofore has been the recipient annually of thousands of barrels of flour from the Atlantic States, will more than supply her own wants for the year to come, and thus another drain upon the market will be cut off and that amount thrown back for home consumption.

The reaction has already commenced in the New York market, on which the *Journal of Commerce* says: "When the market shall be liberally supplied there must be a great falling off in prices, but how soon that will be even speculators cannot determine. Common State flour was sold on Saturday, to be delivered at the option of the sellers, any time in October, at $7 50, or about two dollars below the current rate. More would now be sold on the same terms."

Still there is no occasion for farmers to become panic stricken in consequence of the prognostics in commercial circles of lower prices; the margin for a decline between the present and the lowest remunerative rates being so enormous, that there is no probability of prodrce reaching the latter point for a long time to come. Farmers have been wise, however, who have sold their wheat at or above two dollars, as the interest of the money, the insurance against injury to grain, and the chances of a lower figure very much counter-balance the chances of a better market.

Rain Once More.—More rain fell during last week Thursday and Thursday night than has fallen at any one time, or perhaps all times, since June. The streets and sewers of the city, and in many cases the basements and cellars of stores and houses, were flooded with water.—Some damage was done to the sewers, especially where they had recently been laid down and the earth at the openings had not become sufficiently compact. In one instance a gas pipe was undermined and broken, which caused the escape of five or six thousand cubic feet of the fluid before it was cut off. The weather has been cool and the air bracing since the rain, and nearly all traces of the cholera wiped out. Water in the river is in much better supply, and the thousand wheels of our busy city have once more resumed their tireless revolutions.

Since the above was written, there has been another rain, viz., on Monday evening, with cloudy and warm weather succeeding.

Good.—The Grand Jury, which recently sat in this city in connection with the Court of Sessions, made a presentment of Main street and Court street bridges, and indicted them in consequence. These two bridges have been complete death-traps for years, and it is high time the nuisances were abated, as it is quite probable they will now be. The city and county have been waiting for an appropriation from the State in aid of the re-construction of the first named bridge, but the application to the Legislature has been unsuccessful. In the mean time the structure has been approaching the extreme point of dilapidation, until it is now utterly unsafe for the passage of man or beast.

Maine Election.—The election in Maine took place on the 11th inst. Parties were much split upon various issues, prominent among which are the Maine Law, the Nebraska Bill, and Know Nothingism. Free Soilers and Whigs united, in many cases, under the title of "Fusionists," and elected a large majority of their candidates. Of the officers chosen, the Anti-Nebraska party have the Governor, all the Congressmen, every State Senator, and eighty-two out of ninety-eight members of the lower house.

Riot at New Orleans.—A fearful riot commenced at New Orleans on the evening of the 10th, and was kept up at intervals for three successive days, not being finally suppressed until the entire Police force and the Military were called into requisition. Five persons were killed, and a large number wounded during the various affrays. The two hostile parties were Americans and Irish, and national antipathies the moving cause. There must be something radically defective in Irish character, for of all immigrants from abroad they alone seem to be mixed up with nearly every scene of broil and bloodshed.

Bankrupt Railroad.

The committee appointed by the stock and bond-holders to investigate the affairs of the Buffalo & New York City Railroad, which connects the former place with the Erie at Hornellsville, make some very startling disclosures in regard to its management. They represent the concern as utterly bankrupt, and recommend that prompt and vigorous measures be taken to wind up its affairs.

The committee say that four days previous to their arrival in Buffalo the Directors executed a secret lease of the road and its appurtenances to the President, A. D. Patchin, for the term of one or three years, at the option of the lessee; by which lease he is to receive, out of the first earnings of the road, ten per cent. on its gross receipts—a sum which, as near as the committee can estimate, must amount to about $10,000 or $25,000 per annum. That he, (the President,) who *is ex officio* the agent of all parties in interest, has been permitted to obtain a judgment against the company, without opposition, for upwards of $150,000, without any legal investigation of the sum due him. That the rolling stock, worth half a million of dollars, has been actually sold at Sheriff's sale, and bought in by him in his own name, for the utterly inconsiderable sum of $10,000. The road pays neither dividend nor interest, and the amount of the latter now ever due on the mortgage bonds, is $12,000.

The man who owns but little stock in such a corporation has reason to be thankful that he owns no more, for the larger the number of shares standing in any person's name, the poorer he would be. With ten thousand shares he would be nominally worth a million dollars, when at the same time there would be actually "none so poor as to do him reverence."

Indiana Correspondence.

Indianapolis, (Ind.,) Aug. 28, 1854.

D. D. T. Moore:—After a long and circuitous tramp, by all sorts of conveyance, including "Dan Brourler's Packet," on the Wabash canal, we find ourselves at this common centre of Indiana. This is a level city, and contains 15,000 "Hoosiers." It is regular for shape, and its Capitol and Post Office are really capital fixtures. The workingmen here are in no hurry, and appear to be moderate in avarice as in modesty.—Corn is the chief staple of this portion of the State, and the crop is quite short. Irish potatoes, for spite of the "Know Nothings," are worth $1,60 per bushel; sweet potatoes are sold from wagons in the street at $3. The hens stand the drouth better than the soil, and this year produce better—a bushel of eggs costs less than the same quantity of potatoes! The city of Lafayette, on the Wabash river and canal, is the smartest business city in the State—has 10,000 inhabitants—is 91 miles north of the Capital, and is located handsomely and naturally under the hills, with its canal and railroads on the lower side. The chief railroad passing through the State terminates, south, at New Albany, on the Ohio, and north at Michigan City. It is 288 miles long; is a new road, very level, and the northern 72 miles is directly "straight," an "air line." This road is conducted with eastern ability and sagacity; all its officers are working men, mustachered, active and obliging. A conductor, whose name I learn is "North," in his vocation certainly "knows no North," but does know and attends to his calling.

Michigan City has a local and transient population of 6,000 to 7,000, is a white sand town, at the south end of Lake Michigan, and in the northern extreme of Indiana. The intersection of the Great Indiana Railroad with the Michigan Central Railroad is at this place. The very best railroad buildings, engine houses, manufacturing and other combined conveniences, are here located and built in the most approved modern style. Outside of this Lake City, and throughout the county of Laporte, (signifying "the door," and being at the entrance of a large prairie,) the corn and grass, also wheat, is an abundant crop, and there appears to have been no suffering from the *universal* drouth, for a distance of 40 to 50 miles south; but as you proceed further south, the crops are pinched down to short corn and "small potatoes." Near Monticello, the county seat of White county, a "live stock company," located hereabouts, were loading upon the cars of this new railroad 5?0 head of fat cattle, destined to the New York market. These cost from $3 to $5 per cwt., (live weight.) They were grazing upon as sweet and tall grass as heart or head could wish for, and were in extra condition for the butcher.

The Wabash canal extends from Toledo, in the northwest corner of Ohio, a distance of over 500 miles, to Evansville, in the southwest corner of Indiana, and is decidedly a great canal, passing directly through twenty-seven counties and eight cities. It is the main artery of the State, and imparts a business life and activity to full one-half the area of Indiana. The other half is now being supplied with the best of railroads, diverging and converging to all sections and points. The "Hoosiers" are of themselves, notwithstanding, a slow and easy lot of workers, and have an especial regard for a dog and gun, a leisure day and a large melon patch, and "reckon" fifty cents on the dollar a fair price for a wagon load of twenty to thirty big melons. Fruit is not abundant, so far as I observed, though there is a fair supply for the small number of trees planted. The general carelessness of the people I count the prime cause of their deficiency in almost all varieties of orchard fruit.

Peter Saxe.

That Meteor,—Again.

Eds. Rural:—I see some of your correspondents notice the meteor of the 17th of August. The writer had a fair view of it, and it was truly a most beautiful object. At this place it was seen about ¼ past nine P. M. The night was cool and clear. The meteor appeared to originate near the zenith, and moved in a direction a little north of east, and it exploded and disappeared about 30 degrees above the horizon. Its motion was comparatively slow, giving the beholder time to contemplate its astonishing brilliancy and beauty. In its progress it threw off flashes or scintillations, causing many persons who only saw the light, to suppose that it lightened a number of times in quick succession. In size it appeared a little less than the full moon at zenith. Its brilliancy was most intense, fully equal to the sun, but of a different light, being of quite a deep blue color.

But there was one circumstance connected with it, I have not seen noticed by any of your correspondents, and that was the deep, rumbling sound which followed it, causing many persons who only saw the light, to suppose that it lightened and thundered. This sound resembled very nearly a distant train of cars in rapid motion. It was heard in about half a minute after the meteor disappeared, was very distinct, continued a half minute or more, and then closed by a number of sounds exactly resembling the discharge of distant artillery in rapid succession.

This place is about fifty miles South-west of Rochester. M. L. Ross.

Wiscoy, Allegany Co., N. Y.

Calamities at the South.—The yellow fever has been raging with great severity in some of the Southern cities, and particularly at Savannah. So terrible did it manifest itself in the latter city, that one day last week ten bodies were left unburied, and the sick and dying were destitute of attendance or visitation. In addition to the epidemic, the city and vicinity inland for a distance of seventy miles, have been visited by a destructive tornado, which ruined the crops, unroofed buildings, and did an incalculable amount of other damage.

Indian Massacre.—The Indian tribes on our Western and South-western frontier, are becoming more and more hostile and troublesome.—The War Department has recently received information from the commander of Ft. Laramie of the death of Brevet Second Lieut. Grattan, of the Sixth Infantry, and 20 of the men of that post, who went out to the Sioux, under his command. They were killed in a fight with the Indians on the 18th of August.

We acknowledge the receipt of a basket of very fine pears from Miss C. S. H., of Clinton, Oneida co., N. Y.

Nebraska Indians Starving.—The Iowa Gazette says the condition of the Otoe and Missouri Indians is deplorable, Government having neglected to comply with treaty stipulations. Those tribes are suffering from hunger, and have commenced ravaging the gardens, and plundering the whites sojourning in Nebraska of everything they could put their hands upon. The whites have each paid over ten dollars, which was to secure them from molestation.—The Indians, when upbraided for their breach of faith, state that the Great Father has broken his pledge to them, and they are compelled by hunger to break their faith with the emigrants.

The Iron Foundries of Pittsburgh.—There are now in Pittsburgh thirty-eight iron foundries, of which nine are almost exclusively employed in the manufacture of steam engines, and twenty-nine in the manufacture of various kinds of hollow-ware, machinery, &c. The foundries which are employed in the manufacture of steam engines, consume yearly 3,200 tons of wrought iron, 9,200 of pig iron, employ 640 men, and produce 120 steam engines every year. Their net capital is $540,000.

Reciprocity.—Gov. Gorman, of Minnesota, is *ex officio* agent for the Minnesota Indians. At a recent council of the Chippewas, he threatened any of them who might be found drunk, with the loss of their annuities, and said what was thus forfeited should be divided equally among the sober ones. Hole-in-the-day, a distinguished warrior, remarked in reply that it was just, but that the same rule ought to be applied to the agent, *who was a great man*, and had a great annuity. It ought to be taken from him and divided like the others, *for he got drunk very often.*

The Crops in Canada.—A Goderich correspondent of the Toronto Colonist, writes that the crops in the United Counties of Huron, Perth and Bruce, are now secured in good order. He considers that crops in those Counties are one-third greater than they ever produced before. Further he says, he had an opportunity during the present summer of viewing and examining the crops in nearly every part of Upper Canada; and he is of the opinion that in the United Counties named, the crops on an average are greater than in any other part of the Province.

Coal Consumption by Steamers.—The coals consumed by the West Indian and Brazilian mail steamers amount to about 140,000 tons a year, at a cost of from 40s. to 50s. per ton. The large steamer Arabo, belonging to that company, consumes about 1,300 tons in eleven or twelve days. The extra expense of fuel latterly to the Peninsula and Oriental company, has nearly reached a quarter of a million sterling annually.

An Old Printing Office.—M. Barth, printer, of Breslau, celebrated, a short time ago, the three hundred and fiftieth anniversary of the first book printed in his establishment. This book is a German legend of some rank, and appeared in 1504. M. Barth's printing office is the oldest in Europe, and has been for three hundred and fifty years uninterruptedly in the hands of his ancestors and himself.

News Paragraphs.

☞ A gentleman in Washington, the other day, had occasion to send a letter to a friend through the postoffice. Being destitute of a stamp, he gave a German boy to his employ three cents with which to pay the postage.—The boy, on his way, slipped the pennies into the letter, deposited it in the box, and somewhat astonished the recipient by the singular enclosure, for which he was obliged to pay fifteen cents postage.

☞ The citizens of Florida are engaged in the discussion whether they shall remove the seat of Government, as the Constitution provides from Tallahassee, the present location, which is two hundred miles from the geographical centre of the State, and at least one hundred and fifty miles from the centre of the actual population.

☞ The ship Shannon, of Glasgow, with her cargo, together valued at $100,000, was burned at sea on the 3d ult., on her passage from Glasgow to Montreal. She was 600 tons burthen, and one of the finest modelled vessels belonging to the Clyde. Her crew and passengers, forty in all, were taken on board the ship Glencairn.

☞ Shells weighing 100 lbs. were fired from Lancaster's long-range gun the other day, on board a vessel near the Isle of Wight with a surprising result. One was sent 4,000 yards distance, and reached the top of a cliff 500 feet high. It was calculated that in a tranquil sea, so that good aim could be taken, a mark 7,000 yards distant might be hit by this gun.

☞ The Gaceta of Costa Rica calculates the destruction of locusts in that country, in consequence of the measures dictated by the government, at 150,000,000 insects. Up to the 24th of July, 3,000 sacks of the insects, weighing each 60 pounds, had been presented, for the purpose of obtaining the bounty offered by the government for their destruction.

☞ A newspaper called the News and Advertiser, has been established at the town of Hampton, Va., in the famous congressional district of Virginia known as Wise's, from the fact of its having been formerly represented by the Hon. Henry A. Wise. It was his boast at that time that there was no newspaper printed in the district.

☞ It appears from the report of the Inspector, that the enormous capital of five million dollars is employed in the milk business, in New York and vicinity. The amount paid for pure country milk is estimated in the report at $1,350,000; for swill milk from the distillery fed cows, $2,450,000, for water and adulteration, $1,250,000.

☞ The Princess Zenaide Charlotte Julie Bonaparte died at Naples, on the 8th. She was the eldest daughter of Joseph Bonaparte, King of Spain, and was born at Paris on July 8th, 1802. She married her cousin, Prince Charles, the eldest son of Lucien Bonaparte, and leaves by him eight children.

☞ A live stork was recently caught in a garden in New Haven. It had been shot and its left leg broken, some time before. Its plumage is of a brownish hue. Its wings measure, when fully extended, 6 feet 6 inches, and its height from the floor, when the beak is fully drawn up, 4 feet 3 inches. The skin is to be stuffed for preservation.

☞ By the census of 1850 the population of the United States was over twenty-three millions; of which eighteen millions were native whites, over two millions were foreign born, thirty-nine thousand were of unknown nativities, and three millions two hundred thousand were slaves.

☞ The Knoxville, Tenn., papers relate that on the 10th of July last, Sarah E. Davis was married to Patrick Welch, who left her a widow at the end of fourteen days, and on the 12th of August she laid aside her weeds and became the wife of Thomas Collins.

☞ A Mormon train consisting of nine wagons and some fifty persons, crossed the Missouri at Belleview, Nebraska, on the 14th of August, on their return from a six years' residence at Salt Lake. They left on account of the immorality and oppression of the Mormon church.

☞ The Price Current's annual statement sets down the cotton crop at 2,930,000 bales, and the year's receipts at New Orleans at 1,141,000 bales; the value of the cotton received at $54,210,000, and the value of other articles at $60,610,000; the value of the year's exports at $84,000,000.

☞ The Chief of the Police of Boston reports for the past month these facts and figures:—Foreigners arrested, 1,679; Americans, 440. The number of Americans, it will be seen, is but a little over one-fourth. This is significant, and a solid answer to the question, "Who are our criminals?"

☞ A sad effect of the Maine law in Portland is that the city is driven to hiring men to do the work formerly done by the inmates of the alms-house. So badly has the alms-house degenerated: here is food for the thoughts of tax-payers.

☞ There is a sum of about £15,000 accumulated from unclaimed property in the English Post Office, and this amount is about to be dedicated, with the consent of the Treasury, to promoting life assurance among the post office servants.

☞ Hooped dresses, it is said, are likely to come into vogue again, as the fashionable leaders of Paris are taking the preliminary steps to accustom the eye to the increasing voluminity.—Even now some have their dimensions enlarged by the use of crinoline and whalebone.

☞ Among the curiosities to be transmitted from India to the Great Exhibition in Paris, next year is a carpet of ivory. It is twenty feet long by six broad, and made of long strips of ivory plaited like matting. The price fixed upon is £300.

☞ A letter from Wankau, Wis., in the Stevens Pt. Pinery, gives the number of feet of lumber sawed by one pair of saws in six days. The number is 105,968, not counting the refuse lumber. Six men were employed in tending the mill.

☞ Twenty-five years ago—four families, having emigrated from one of the older states to Illinois, settled in Morgan county. In those four families there were thirty children—cousins to each other—all of whom are still living.

☞ Cassius M. Clay is sowing sentences and reaping from throughout Illinois on the slavery question. At Freeport, one of the banners of the delegation which turned out to receive him bore for a motto, "Help us, Cassius, or we sink!"

☞ Barnum's showmen had a desperate fight with rowdies at Rappahannock, Va., the other day. Many persons were knocked down, including the Magistrate.

News Brevities.

—The Mormon population of Utah is 50,000.

—There has been 1,774 deaths by cholera in Montreal, this summer.

—In Denmark, entire villages have been converted to the Mormon faith.

—There is in the Treasury of United States $25,000,000 subject to draft.

—The number of deaths in New Orleans last week, by yellow fever, was 625.

—The Cincinnati Price Current gives the hog census of 64 counties in Indiana at 2,168,583.

—The Missouri Legislature will stand, Whig, 60; Anti-Benitonites, 60; Benitonites, 41.

—The Sandwich Islands will, it is said, cease to be importers of flour from this time forward.

—E. K. Collins gave Miss Dix, the philanthropist, a free passage to Liverpool in the Pacific.

—The Sault Canal Company have now 1,700 men in their employ, and the work is rapidly advancing.

—Counterfeit $100 notes on the Shoe and Leather Bank, of Boston, are in circulation in New York.

—Cholera, since it first appeared in 1817, has, it is stated, swept off upwards of 70,000,000 of the human race.

—The executors of Samuel Appleton have handed over $20,000 to the new Ipswich (N.H.) Appleton Academy.

—The hand of an active compositor travels, in picking up the types, in a single day's work, nearly five miles.

—The clerks in the Post Office at New Orleans, lately left in a body, owing to a quarrel with the Postmaster.

—Murdock, the actor, has just returned to New Orleans from California, having made a fortune there.

—A recent fire in Halifax destroyed the central portion of the Government House, involving a loss of some £7,000.

—M. de Lamartine has just sold a history of Turkey, in six volumes, to the proprietors of a Paris daily newspaper, for £1,800.

—The grand exhibition of the industry of Nova Scotia, will commence at the Government House, Halifax, sometime in October.

—The Newfoundland Times understands that there has been a great falling off in the fisheries on the French shore of the Island.

—On Tuesday week the house of Mr. Baldwin, at Moriah, Essex county, was burned down, and himself, wife and four children perished in the flames.

—Over 100 citizens of Montreal visited Burlington, Vt., on the 6th. They had a glorious time with the Green Mountain Boys, and left delighted.

—Donnybrook Fair, in Ireland, once so notorious for its revelries, commenced on the 20th of August, but has now become an extremely dull affair.

—Two members of the Swiss Rifle Company, New York, on Monday fired ninety times at a target ninety paces distant, and missed it but twice.

—The Halifax Sun of the 12th inst., says: The orders for the immediate embarkation of the 72d regiment and a company of artillery from this garrison for England, is countermanded.

—The Washington Globe says:—The treaty annexing the Sandwich Islands to the United States, we are assured from good authority, is now in the State Department.

—The subscription for the monument to Prof. Wilson, progresses most favorably. The subscriptions already exceed £900. The sum required is about £1,400.

—A raft of timber, being towed from New York to New Haven, separated in the Sound, in a storm, and only three sticks reached their destination. Loss $15,000.

—The French Government is removing from office all public administrators and medical officers, who deserted their posts on account of the approach of the cholera.

—Letters from residents in the western part of the State of Ohio, mention that the crop of apples in that vicinity is very large, and the fruit is sold at low rates.

—A couple of German Jews, smugglers, have been arrested in New York, who had in belts around their bodies $150,000 worth of diamonds, watches and jewelry.

—The proposition to sell the public markets in New York city, has met with a recommendation to do so, by the Finance Committee of the Board of Aldermen.

—Dr. T. Wood, of Cincinnati, recently removed a large tumor from the shoulder of a five-year-old filley, while the animal was under the influence of chloroform.

—The Louisville Journal says, notwithstanding the shortness of the corn crop, Shelby county will this year fatten for the market 80,000 hogs. Twice as many as last year.

—The Washington City Council has refused to enforce the prohibitory liquor law, which received the sanction of the people at the recent municipal election in that city.

—Daniel Ames died at Muttville, Conn., on the 29th ult., aged 100 years one month and ten days. He was wounded at Bunker Hill, and was in several other revolutionary battles.

—The supply of paper is so inadequate to the demand in England, that old newspapers are re-manufactured and used over again, the ink being first extracted by a chemical process.

—Connecticut has twenty-eight clock factories, employs 1,279 hands, has $1,002,000 capital invested, and makes annually 725,000 clocks. One-fourth of these find a market in England.

—An English writer says you can tell when you are surrounded by a dozen Americans, by the following unerring test—three will be found smoking cigars, and nine reading newspapers.

—A rich citizen of Cologne has given to that town some $70,000 to build up a public gallery of the Fine Arts, an example which might be followed elsewhere with great advantage.

—The deepest well in the world, is said to be the artesian well at St. Louis, which the Messrs. Belcher & Brother, of that city, have been boring for six years past. It is now 2,200 feet in depth.

—The Washington Union announces that orders have been received for the withdrawal of the British fleet in the Gulf of St. Lawrence, and to throw open the prohibited fishing grounds to the United States.

Literary Notices.

THE PRINCIPLES OF ANIMAL AND VEGETABLE PHYSIOLOGY; a Popular Treatise on the Functions and Phenomena of Organic Life. By J. STEVENSON HUTCHISON, M. D., Philadelphia: Blanchard & Lea, 18-4.

This volume is a re-print of a recent English work, and one of the series of "Orr's Circle of the Sciences," to which OWEN, ANSTED, and LATHAM, are contributors. It is designed as a manual for the general reader, and is written in a popular style, while its facts are carefully in accordance with the latest scientific investigations. To it is prefixed a General view of the great departments of Human Knowledge, of much value to those not posted in Science.—Sold at DEWEY'S.

THE CAPTAINS OF THE ROMAN REPUBLIC, as compared with the Great Modern Strategists; their Campaigns, Characters and Conduct, from the Punic Wars to the Death of Cæsar. By HENRY WM. HERBERT. New York: Chas. Scribner, 1854.

THE character of this volume is sufficiently indicated by the above title-page, and the ability of the author to give interest to such a subject is well known in the literary world. Two years since he gave to the public a book on "The Captains of the Old World,"—this is on the same general plan, and contains sketches of SCIPIO AFRICANUS, FLAMINIUS, PAULLUS, CAIUS MARIUS, SYLLA, and JULIUS CÆSAR. Sold at WM. ALLING'S.

HERMIT'S DELL. From the Diary of a Pencilter. New York: J. C. Derby, 8 Park Place

A volume of country sketches of a very pleasing character. There is little risk of out having too many books of this kind,—the public taste seems turning very decidedly to Rural life, and those who cannot otherwise partake in it enjoy reading about it. Briar Cliff and Hermit's Dell are pleasant places, and life has it changes and episodes there as every where. Sold at DEWEY'S.

THE HOME IN THE VALLEY. By EMILIE F. CARLEN. Translated from the Original Swedish, by ELBERT PERCE. New York: Chas. Scribner.

This book is a story of Swedish country life very pleasantly told, and contains a moral for those who are not "happy at home." Few will own this to be the case, however, so those who are may read it, to see how pleasantly it ends, and how virtuous love ought ever to be rewarded. Sold at WM. ALLING'S, Exchange street.

BLACKWOOD'S MAGAZINE for September, has articles of much interest on The Holy Land, Speculations among the Stars, Mrs. Stowe's Sunny Memories, The Spanish Revolution, and The Coming Fortunes of our Colonies in the Pacific. New York: L. SCOTT & Co. DEWEY, Agent.

Foreign Intelligence.

Arrival of the Niagara.

The Cunard steamship Niagara, from Liverpool, arrived at Halifax Sept. 12.

FIN LAND.—Sweden is said to have refused to accept the Aland Isles, on condition of joining the Allies against Russia. France and England have therefore decided to dismantle and abandon the fortification at Bomarsund. They were so badly damaged, and wanted so large a garrison to hold them against the enemy, that it was not considered expedient to retain them.—One hundred and twenty-two mounted, and eighty dismounted guns, taken at Bomarsund, will be divided between France and England.

A small engagement, without loss of life, occurred at Abo, on the 18th ult., between eighteen Russian gun boats and some English steamers.

SOUTH-EASTERN EUROPE.—From the Principalities and the Danube, it is reported that the Turks continue to occupy Bucharest, and are strengthening all strategic positions.

The reports from Varna in relation to the proposed expedition to the Crimea are, as usual, inconsistent. It is said that Marshal St. Arnaud will hold a general council at Varna, to inquire if the army is fit for service during the present sickness.

The hospitals and magazines of the Russians were being removed to Bessarabia.

Transports continued to arrive at Varna from Malta. The French were beginning to grumble at their continued inactivity.

The cholera was abating. Its ravages, both in the fleet and army, were horrible, many thousand having fallen victims.

All was quiet at Constantinople. Said Pasha, the new Viceroy of Egypt, was visiting the Sultan. Devereux Pasha, a skillful diplomatist, has been sent to the Principalities as Turkish Commissioner. Riza Pasha was intriguing to have Omar Pasha transferred to the command of the army in Asia, but the Sultan refused.

ASIA.—The reported disasters of the Turks are confirmed. On the 29th of July, Selim Pasha was defeated, and the Russians occupied Bajazid. On the 7th of August, a vaporating display of force by the Turks brought on a general engagement, and a great battle was fought near Kars. The Turks attacked the Russians' entrenched camp at Youronkdere, and also drove in the right wing of the Russian army, but a general charge by the Russian cavalry swept them back with immense loss. Four thousand Turks were killed. The Russians suffered severely. The Turks confess that the Russians had the victory. An armistice of two days was agreed to after the battle. The Turks retreated into Kars and abandoned their camp, which was occupied by the Russians. The Russians admit a loss of nearly 10000. The battle lasted five hours, 40,000 men and 150 guns being engaged in it. Selim Pasha is superseded by Mustapha Pasha, who distinguished himself in the Dobrudscha.

GREECE.—Considerable excitement has been caused by the announcement of the French commander that as the Piræus is unhealthy he will remove his troops to Athens.

The delay which was granted by the Porte to Greece for the adjustment of her difficulties with Turkey, expired on the first of September. No arrangements had been made, but negotiations were pending.

GREAT BRITAIN.—The weather continued extremely favorable, and a large proportion of the crop had been secured.

FRANCE.—The Emperor has left Paris for the camp at Boulogne. The Empress remained at the Baths.

The Moniteur publishes the official account of the fall of Bomarsund.

A report was circulated on the Paris Bourse that Sweden and Denmark was on the point of signing a treaty of alliance with the Western Powers, but the report was considered doubtful.

SPAIN.—Madrid was profoundly tranquil, but other parts of the country are still disturbed.

Arrival of the Atlantic.

NEW YORK, Sept. 13.

The Atlantic arrived this morning with Liverpool dates to the 6th.

At Tuesday's market there was a fair attendance, but wheat declined 3d@4d from Friday, and closed at 80@81 6d for white, and 61 10d@71 3d for red.

Flour was in retail demand. Ohio 28@29s. Phil. and Balt. 27s 6d@28.

Corn dull, and market declining.

Cotton shows no change since Friday. Sales for four days 27,000 bales.

Consols 96¼. Money easy.

Trade at Manchester satisfactory.

ONE HUNDRED AND FIFTY DOLLARS FOR SETTING A GANDER'S LEG.—Dr. S. came to settle at Bloomfield, half a mile north of what is now Piety Hill, or Birmingham, in 1820, and commenced farming and the practice of medicine. A year or two afterwards a neighbor, as he was then called, a man who lived about eight miles off, with whom the doctor was at variance, called him about the middle of a bitter winter night, to go to his house and mend a broken leg. The doctor was never backward in obeying a professional call, and was underway in short order. Arriving at the place, he found the patient to be an old gander, who, sure enough, had a broken leg; so he set out to work, made splints and bandages, put the leg in place, and went home, leaving Mr. Gander as comfortable as could be expected. In due time the owner of the gander was presented with a bill of $10, for surgical services, which he refused to pay. Dr. S. sued him before a justice, and recovered the amount with cost. The gander appealed, or his owner did for him; the judgment was affirmed with new costs. The gander took another and last appeal to the Supreme Court, where the judgment below was affirmed, with new cost, from which court an execution issued for $111 damages, and $150 costs of suit, which was levied on the farm and finally paid, leaving the world in doubt which was the greatest goose of the two.—*Dayton (Ohio) Empire.*

A PROFITABLE SPECULATION.—A Sunday paper says:—"We heard of a dodge to raise the wind the other day, that does credit to the sharpers whose wits got it up. There are three gentlemen engaged in this new enterprise, and we are told that they have collected some thousands of dollars during the past few weeks.—Their plan of operations is: Two of them, dressed as laborers, visit a grocery store, buy a pound of some cheap article, take it off and weigh it with a standard scales which they carry with them. If it falls short of the full and correct weight (which it does in nine cases out of ten,) they kick up a grand breeze with the grocer, threaten prosecution, and finally, through the intervention of a *gentleman* (the other partner,) who steps in just at the nick of time, the trouble is compromised by the payment of an X or a V, by the grocer, to settle the matter. In one instance, $311 was paid to hush up one of these cases; the article bought was sugar, and the pound only weighed thirteen ounces!"—*N. Y. Tribune.*

STAMPEDE.—Information has been received at St. Louis, from the Plains, of the loss of a large number of horses designed for the service of the United States in New Mexico. These horses were purchased last spring, and left Fort Leavenworth in the command of Col. Fauntleroy.—At the last advices Col. F. was in camp on the Arkansas river, three miles above Fort Atkinson. About that time, it seems, there was a *stampede* of all the horses, to the number of more than four hundred, of which one hundred and forty are still missing, though great exertions had been made to recover the whole of them. The aid of Indians was obtained in the capture, but when the horses were caught they were jaded and worn down, and many of them of very little value. Col. F. had moved on, leaving a force to secure the remaining animals.

A LITTLE HEROINE.—Last week Friday, during a fire at Brookville, Jefferson county, Pa., a Mrs. Brady, who resided in the burning dwelling, was absent at the time gathering plums, having left her babe in charge of a small boy. When it was known that the baby was still in the house, a little girl 12 or 14 years of age, named Amelia Farely, rushed through the smoke and flame, up the stairs, and succeeded in saving the child, and took care of the little innocent till its mother's return.

Marriages.

In Honeoye, Ontario Co., on the 14th inst., by Rev. C. H. Baldwin, MYRON H. BLACKMER, of Livonia, and Miss HATTIE N., daughter of John Pennell, Esq., of the former place.

In Wheatville, Genesee Co., on the 17th inst., by Rev. Horace Perry, CHARLES GILL, Esq. of Batavia, and Miss MARTHA LANCKTON, of the former place.

In East Bloomfield, Ontario Co., Sept. 12, by the Rev. Henry Kendall, GEO. C. GOSS, Esq., and Miss ELLEN E. POST, of Pittsford, Monroe Co.

Deaths.

AT Yales Centre, Sept. 1st, of Congestive Fever, after an illness of two weeks, ANSON L. ANGLE, Esq., aged 47 years.

By this afflictive event his family has been deprived of a kind husband and father, and the community of a very worthy citizen. During a residence of twelve years, the deceased has well sustained the various relations of social and civil life. Frequently had he received, and as often exercised, satisfactorily, the civil trusts of his fellow citizens, and by his industry, integrity, and other social virtues, he merited and received the sincere esteem of the community.—COM.

IN Alabama, Genesee Co., N. Y., on the 17th inst., of Consumption, JOSEPH PALMER, aged 68 years.

His illness was long and painful, but of such a character that his death came suddenly to all. His life was that of a Christain, and his bereaved widow and scattered children may learn, as he did, to the promises of God for support and consolation.

IN Greenville, Green Co., N. Y., suddenly, of Dropsy, Mr. WILLIAM PARKE, (father of M. Parke, Esq., of Clifton Springs,) aged 73 years.

IN Phelps, N. Y., Sept. 16th, Mrs. CURE, aged *one hundred years and seven months.*

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE, Rochester, Sept. 21, 1854.

THE tendency of the Wheat and Flour market is downward, although the scarcity of the Mills causes all the grain offered to be taken at the highest rates the market will warrant. Wheat is selling to-day at $1 97, and has been down at one time since last quotations, to $1,94. Flour has declined a quarter of a dollar per barrel during the week. The arrival of the Atlantic, just announced as we go to press, brings news of another decline in Breadstuffs abroad, equal to 6 or 8 cents per bushel, the effect of which will probably be to depress prices here. Oats and Corn unchanged. Barley is in demand at 80 to 83 cents for prime. Clover seed is higher, with but very little or none in market. It retails at $8. Timothy is now at $3@3,50, while Rye brings $1 37½, and retails for seed at $2. White Beans are higher—read by selling at from $1,00 to $1,25.

There are no essential changes in other respects, in our wholesale markets.

In the financial world there is nothing of special interest. Government stocks continue to come in for redemption, and the speculations in Railroad stocks is quite active. Erie, which went up twenty dollars a share from the extreme depression, has again partially subsided, and now sells at 42. N. Y. Central brings 91¾.

The Empire City, from Aspinwall, which arrived last week too late for announcement in our financial article, although noticed in our editorial columns, brought in $1,100,000, and the Europa and Baltic have taken out $1,700,000, so the balance of shipment is against us over half a million.

NEW YORK MARKET—Sept 18

FLOUR—Market continues depressed, and for fancies and extras easier prices were accepted. Stock light, but the receipts are increasing and holders manifest a disposition to realize on all grades except corn State, which is wanted for settling contracts. Sales at $8,75@9 com. to straight State; $8,75@9,25 com to fancy Ohio and Mich; $9,37½@10 50 extra Ohio; 10,00@10,75 extra Genesee.—Canal is in active, owing to the receipts of vessels from the British Provinces. The nominal price is $9,75, in bond. Rye flour and corn meal without important change.

GRAIN—Market dull. Supply light and demand fair. Sales prime white Mich at $2, mixed and white Southern at $1,85@1,92. Genesee nominal at $2,10@2,12½. Small sales made at fair prices, which are above the market. Rye scarce and firm; sales at $1,23. Barley quiet and nominal at $1 and thereabouts. Receipts of corn large and market lower; sales at 80@82 common and Western mixed. Oats in fair request at 54@55c.

PROVISIONS—Market for Pork a shade firmer; sales at $14,25 for mess, $11,87½@12 for prime, $10 93 rumps, and $16 50@15,62½ clear. Lard heavy and demand moderate; sales at 11½@11¾ for fair to choice. Butter and Cheese in fair demand at previous prices.

ALBANY MARKET—Sept. 18

THE market this morning presented a far more animated appearance than it has done at any previous time this season. There was a good attendance on 'Change, and the receipts of samples exceed that of any previous day this Fall. The transactions, however, have been limited, buyers and sellers being apart in their views.

FLOUR—The market for Western and State Flour opened dull and heavy. During the morning the enquiry has been very limited, with an anxiety on the part of holders to realize. The stock is steadily increasing while the trade only buy sparingly for the supply of the consumptive demand. Only a few hundred barrels changed hands at $8,-87@9,25 for com. to good State; $9@10,25 for good to extra estern; and $9,50@10 50 for fancy to extra Genesee. Corn meal is steady at $4,00@4,75 ₩ 196 lbs.

GRAIN—In Wheat nothing was done this morning. In Corn only a moderate business, at a slight reduction on the closing prices on Saturday. On the part of buyers a disposition was shown, at the opening, to crowd the market down. Sales Western mixed at 78@79c, closing at 78. A small parcel of Rye sold at the Central Depot at $1,25 ₩ 60 lbs. In Barley we still notice a buoyant feeling, with moderate receipts. The demand for prime lots continues pretty active, and the market still favors the seller. Sales prime four-rowed at $1,16. Oats are in good supply, and the market is heavy and dull. Sales Chicago at 56c measure, and extreme quotation. In the street Rye is selling at $1,24 ₩ 60 lbs, Oats 52@53, and Timothy at 4.

FEED—Sales 2300 bus. Middlings at $1,05.

BUFFALO MARKET—Sept. 18

FLOUR—The market for Flour continues inactive, with a downward tendency. Demand confined mainly to the retail trade. Sales on Saturday at $8,37½@8,50 good to choice brands Ohio and Mich.

GRAIN—Wheat quiet and no sales, buyers holding off for lower rates. Corn opened firmer with a moderate demand, sales at 69c. In the afternoon there was less firmness, and sales were made at 68c, market closing very tame. Oats in fair demand and market firm. Sales at 44c.

NEW YORK CATTLE MARKET—Sept 11.

AT Washington Drove Yard—Offered to-day 2,800 Beef Cattle; during the week 2,810. The market is steady at from $7 to 9,50 per cwt. Only a few were sold at the latter price. Cows and Calves, $28 to $35@50. A good supply. Sheep from $1,75@5; Lambs $1,50@5. Hogs—100 on sale; prices corresponding with last week's quotations.

At Browning's—At market, 466 Beef Cattle, 20 Cows and Calves, 50 Veals. Sales at $7@9,50 per 100 lbs. for Beeves; Cows and Calves range at from $25 to $45. Veals sold at from 4½@6c per lb. Sheep range at from $1,50 to $5,50. Lambs $1,50 to $3,50.

At Chamberlain's—At market 604 Beeves, 141 Cows and Calves 260 Veal Calves, 4,300 Sheep, and 3 741 Lambs.—Prices of Beef ranged at from $6,00 to $9,00 per 100 lbs. Cows and Calves at from $25 to $60. Veal Calves 4 to 6½c per lb. Sheep $2,50 to $6. Lambs $1 75@4,00

At O'Brien's—Sales of Beeves at $6@10 per 100 lbs—Cows and Calves at from $25 to $45; Veal 5@6c. ₩ lb.

ALBANY CATTLE MARKET.—Sept 11.

AT W. Woolford's Bull's Head, Washington street.—Beef Cattle—750 at market. Prices—Extra $7,50; 1st quality $7; 2d do, $6,50; 3d, $5@5,50.

Cows and Calves—Few in market. Prices range from 26, $30@45.

Sheep and Lambs—600 in market. Prices range from $3 to $4 for Sheep, $2,50@3,25 for Lambs.

Swine—Not any in market.

The majority of these cattle were sold for the Brighton market. Sheep and lambs are selling very well at the above prices. All sold.

CAMBRIDGE CATTLE MARKET.—Sept 13.

AT market 1,600 Cattle—about 1,500 Beeves, and 4,0 Stores.

Prices—Market Beef—Extra $8 per cwt.; 1st quality, $7-00@7 50; 2d do, $7@7,25; 3d, do, $6@6,50; ordinary, $5@5,50. Hides, ₩ cwt, $6,75@6; Tallow 8@8,50; Pelt 40@62c. Calf Skins, 11@12c ₩ lb. Veal Calves $5,50 to $8.

STORES—Working Oxen—$85 to $135@160.

COWS AND CALVES—$21 to $45@55. Yearlings, $8 to $9@11. Two years old—$17 to $20@30. Three years old—$25 to $32@45.

SHEEP AND LAMBS—6,700 at market. Prices—Extra—$4,50 to $6@10. Cts lot—$1,50 to $3@5,50.

SWINE—Wholesale, still hogs at 4½c; lard at 5c per lb.

BRIGHTON CATTLE MARKET—Sept. 14.

AT market 1,600 Beef Cattle, 850 Stores, 8,200 Sheep, and 674 Swine.

PRICES—Beef Cattle—Extra $8 25@8,50; first quality, $7,75@8; 2d, $6,50@7 37; 3d, $5,50@6,50.

Working Oxen—Sales $70 to $140@150.

Cows and Calves—Sales $20 to $55.

Sheep—Small lots $2,00 to $4,50.

Swine—Dull; old hogs 3@4½; shoats to peddle 4; still fed fat hogs, 4¾; at retail from 4 to 6½c.

Advertisements.

ADVERTISEMENTS inserted in the RURAL NEW-YORKER at 15 cents a line, each insertion,—*to be paid in advance.*—Brief advertisements preferred, and we do not wish to give any one more than four successive insertions. Our space is limited, and we wish to accommodate and benefit as many applicants as possible,—at the same time interesting our readers by presenting something new, weekly.

☞ The circulation of this paper is several thousand greater than that of any other published in this State, out of New York city,—and we believe it largely exceeds that of any other Agricultural or similar journal (monthly, semi-monthly or weekly,) in either America or Europe.

FOR NEW HORTICULTURAL ADVERTISEMENTS, see page 303,—third page of this number.

FARM FOR SALE,

SITUATED two miles N. E. of the village of Fulton, Oswego Co., containing about 50 acres of choice land under a high state of cultivation. House new and convenient, painted white, with suitable barns and sheds. There are about eighty bearing apple trees of choice fruit, some peach, cherry and pear trees mostly young; also, 50 selected and grafted apple trees, set two years ago, and thriving nicely. Price, $3 200; about one-third of the purchase money to be paid down, the rest to remain on mortgage to suit purchaser. For further particulars inquire of
246-2t* Mr. C. G. BACON, Fulton, Oswego Co., N. Y.

VALUABLE FARM FOR SALE,

SITUATED in the Southwest part of the town of Castile, Wyoming Co., N. Y., and 1½ miles from the village of the same name; containing 210 acres, exclusive of Railroad way—35 acres of timber, the balance under improvement. It is well watered by two living streams, and is a good grazing or wheat farm. There are three houses, three wells of water, and three orchards; and it could be conveniently divided—giving one farm with 95½ acres, the other, with 123½. It is one mile from the East Bainsville Depot, and 1½ from Castile Depot, on the Buffalo and Hornellsville Railroad.

Terms easy. For particulars inquire of WALTER A. SCOTT, on the premises, or of A. KARNES,
246-3t Rochester, N. Y.

10,000 COPIES SOLD IN FOUR WEEKS.

CHEAPEST PAPER IN THE WORLD!

THE DIME,

A BEAUTIFUL Illustrated Monthly; Twenty columns of Reading matter; ten or more Engravings; A Song, words and music; An Original Tale; a column of beautiful Poetry; Departments of Agriculture, Mechanics, Domestic Economy, Manners, Science, &c.; Editorials and Amusing Miscellany, in every number, and all for

TEN CENTS A YEAR.

Determined to publish the DIME, the CHEAPEST, and the MOST WIDELY CIRCULATED PERIODICAL IN THE WORLD; expecting, within a year, to reach a monthly issue of ONE MILLION; the proprietors offer the sum of Ten Thousand Dollars, in premiums, as follows:—To the persons sending the *five* largest clubs, five HIL PAINTINGS, valued at $500, $300, $200, $100, and $50; to the next *five*, books or other articles, at $10, $30, $20, $10, and $5. To the next *Hundred* premiums of one to five dollars value; and sufficient premiums to all persons sending clubs of ten or more—or in lieu of the premiums, a *commission* of ten per cent, or *eleven copies for one dollar*

The DIME is intended to be entirely moral, and unobjectionable; avoiding all subjects of a *sectional, partizan, or sectarian character*; giving facts, rather than opinions. It aims to be of the greatest use and benefit to all, giving offence to none, and becoming every where, a cheerful and welcome visitor.

Address, with Post-Office, County and State, post-paid, T. ELLIND, CLAY & CO., Publishers,
240-4t No. 14 Spruce St., New York City.

FARM FOR SALE,

SITUATED in the town of Bethany, Genesee Co., N. Y., and two miles south of the depot of the Canandaigua and Niagara Falls Railroad at Stafford Centre, five miles from the village of Le Roy, and six from Batavia. It contains 110 acres of suitably proportioned timber, wheat and meadow land, in a good state of cultivation, and is well watered by living springs and a creek running through it. An orchard and garden well stocked with choice fruit trees. A good frame house, pleasantly situated, with ample and convenient outbuildings. Terms easy.

To any person wishing to purchase a good farm, at a moderate price, in one of the best sections of the State, the above presents a desirable opportunity. Apply to, or address [245-3t] EDWARD HAMMOND,
Sept. 14, 1854. Stafford Genesee Co., N. Y.

ANDERSON'S DOUBLE-TRIANGULAR HARROW,

PATENTED August 1st, 1854, is universally acknowledged by agriculturists who have seen it in operation, to be the best Harrow for all purposes now in use. By the particular arrangement of the teeth, the entire surface is thoroughly pulverized. Its peculiar form also renders it very effective in new, uneven or stumpy ground; one half being made to turn completely over the other in passing a stump, if required. It is fairly admitted that one harrowing with this harrow, does more execution than twice by those in common use. The Patentee, being a practical farmer is willing to dispose of rights in Towns, Counties, or States, for the benefit of the public, or the Harrow may be had on application to WM. ANDERSON,
244-3t Jacksonville, Tompkins Co., N. Y.

FARM FOR SALE,

Sept., '54. 244-3t Barre Centre Orleans Co., N. Y.

CHEMICAL ANALYSIS.

J. BRYAN, Practical Chemist, 112 State St., Rochester, N. Y., is prepared to make *full and accurate* analysis of Minerals Soils, Metals, Mineral Waters and Chemical Compounds, and articles suspected of adulteration and *Poisons*, either organic or inorganic, and in quantity or quality. It is necessary to send one or two ounces of a solid, and a pint or more of a fluid for examination. 241-13t

MOORE'S RURAL NEW-YORKER has become a great among its kind. With a subscription verging fast to 30,000, and with a conductor who knows how to polish it with every grace of the art, and how to accomplish it with the best talent of the age—it is not surprising that it is now the leading agricultural paper of the country.—*Christian Adv.*

UNDERDRAINING TILE.

THE ROCHESTER BRICK AND TILE MANUFACTURING CO., have on hand a large supply, and are constantly manufacturing Tile of the different varieties and sizes used for underdraining farm lands. The extent of the failure of the wheat crop the present season has, more conclusively than it has been for many years before, shown the utility of Tile Draining—for in no instance, and it is safe to say on no premises where lands were properly underdrained, has wheat been known to be injured by winter-kill,—which every one knows is caused by the freezing and thawing of water standing upon the wheat.

The following is a list of the prices for the several varieties and sizes of Underdraining Tile delivered at our premises in Brighton, one and a half miles east of the city of Rochester. The Company will deliver Tile on canal boats at fifty cents advance per thousand, on their yard prices, and on vessels running on Lake Ontario at reasonable charges, for transportation. Prices as follows:

1 Inch Pipe Tile		$7 00	per thousand.
1½	do	8 00	do.
2	do	9 00	do.
3	do	12 00	do.
4	do	22 00	do.
5	do	5c.	per rod.
2 Inch Horse-shoe Tile		$8 00	per thousand.
3	do do	11 00	do.
4	do do	14 00	do.
8 Inch Round Tile		10c.	per rod.

1000 Tiles will lay 66¾ rods, or 15 Tiles per rod.

For further particulars, address WILLIAM OTIS, Superintendent.
244-tf Rochester, N. Y.

GUANO.—NOTICE.

As there is a substance now selling by some dealers in this city and Brooklyn, for No. 1 Peruvian Guano, we caution the agricultural public who may purchase Peruvian Guano this season, to observe that every bag of the genuine article will have the following brand:

No. 1
Peruvian Guano.
Imported by
F. BARRELDA BROTHERS.

The price is now established for this season at $50 per ton of 2,000 lbs. When taken in lots of 5 tons and upwards, a discount will be made.

LONGETT & GRIFFING,
State Agricultural Ware House,
241-7t No. 25 Cliff street, New York.

THE HORSE, THE HORSE!

Noblest of Domestic Animals,

And the one most frequently ill-treated, neglected, and abused. We have just published a book so valuable to every man who owns a Horse, that no one should willingly be without it. It is entitled

THE MODERN HORSE DOCTOR,

And is from the pen of that celebrated English Veterinary Surgeon, Dr. GEO. H. DADD, well known for many years in this country, as one of the most successful, scientific and popular writers and lecturers in this branch of medical and surgical science. The book which he now offers to the public, is the result of many years' study and practical experience which few have had.

From the numerous and strong commendations of distinguished men and the newspaper press, we select the following:

Extract from a letter from Hon. John H. Clifford, Ex-Governor of Mass.

New Bedford, May 11, 1854.

DR DADD.—*Dear Sir*—I hope your new work on the noblest creature that man has ever been permitted to hold in subjection, the horse, will meet with that success which all your efforts in this direction so well deserve.

Your obedient servant,
JOHN H. CLIFFORD.

From Hon. Marshall P. Wilder.

BOSTON, May 13, 1854.

DR. DADD,—*My Dear Sir*:—I am greatly obliged to you for the valuable treatise, the results of your own investigations, which you have recently issued, hoping that it may meet with the patronage of a discriminating community.

I remain yours with great regard,
MARSHALL P. WILDER.

The *Modern Horse Doctor*, by C. H. Dadd, is a manual of genuine science, and ought to be owned and studied on the score of humanity, as well as interest, by every man who owns a horse.—*Boston Congregationalist.*

Dr. Dadd has had great experience in the cure of sick horses and explains the secret of his success in this vol.—*N. Y. Tribune.*

The author of this work is well known as a most skillful veterinary surgeon. His book is based on the soundest common sense, and as a hand-book for practical use, we know of nothing to compare with it.—*Yankee Blade.*

We know Dr. Dadd well, and are satisfied that he possesses most important qualifications for preparing such a book as this.—*N. E. Farmer.*

Messrs. Jewett & Co., have just published a very valuable work by Dr. Dadd, a well known veterinary surgeon, on the causes, nature and treatment of diseases, and lameness in horses.—*Farmer's Cabinet.*

This is one of the most valuable treatises on the subject, ever published; and no owner of that noblest of the animal race, the horse, should be without it. Especially should it be in the hands of every hotel and livery-stable keeper. To many a man would it be worth hundreds of dollars every year.—*Ind. Democrat, Concord.*

By far the most learned and copious work on the horse and his diseases we have ever seen.—*N. Y. Evangelist.*

One of the greatest and most commendable qualities of this work is it is *practical* and plain to the comprehension of those farmers and others for whom it is designed. The course of treatment favors generally a more sanative and rational system of medication than that recommended in any previously existing works on farriery. No farmer or owner of a horse should be without this book. Stable Keepers, stage proprietors and hackmen, we believe would derive profit by having at least one copy hung up in their stables for use and reference by their stable men.—*Daily News Philadelphia.*

There is more common sense in this book than any of the kind we have ever seen, and farmers and owners of horses would find it a matter of economy to possess themselves of it. It will be of more service than the counsel of a score of ordinary doctors.—*Albany Courier.*

We deem this decidedly the best and most reliable work on the "Cause, Nature, and Treatment of Disease and Lameness in Horses," ever published.—*Nantucket Enquirer.*

What we have read of this book induces us to regard it as a very sensible and valuable work; and we learn that those much more competent to judge of its value, have given it their unqualified approval.—*Ex. Trav. Boston.*

This book supplies a great desideratum which Skinner's admirable treatise on the Horse did not fill. Every man may be his own veterinary surgeon, and with much greater safety to this noble animal than by trusting him to the treatment of the empirical influences who infest the country. It is well illustrated, and should be purchased by every man who owns a horse.—*Ev. Mirror, New York.*

This is a book that should be forthwith put into the hands of all who own or drive horses, whether for the dray or gig, for the plow, omnibus or road for hard service or pleasure.—*McMakin's Courier, Philadelphia.*

A good clearly written book, which should be in the hands of every man who has a horse whose life his affection or his purse makes it worth while to cure.—*Bangor Mercury.*

This is a scientific, thorough and complete treatise upon the diseases to which one of the noblest of animals is subject, and the remedies which they severally require.—*Troy Daily Budget.*

It is a valuable book to those who have the care of Horses.—*Hartford Herald.*

He is not worthy to have a horse in his care, who will not use such a work to qualify himself for his duties to this animal.—*Commonwealth Boston.*

SEPTEMBER.—SONNET.

BY MRS. E. J. EAKER.

PEACEFUL September! Ehlest daughter thou
Of meek-eyed Autumn, welcome here again,
With the pure beauty of thy tranquil brow—
With the sweet music of thy prairie train!
The softened glory of thy leaves and flowers,
Fruit-laden soil vines wreathed in Pomona's bowers;—
The golden-green light gleaming through the trees,
The tender radiance of thy clear blue skies,
Stirred by the pinions of the odorous breeze!—
"Mouth of my heart!" Like dew spring in mine eyes
Thy gentle presence comes! Time hath bereft
My path of much—and the cold world estranged
Many from me:—thanks that thy gifts are left
To endure unto the end, undimm'd, unchanged!

Rural Sketch Book.

THE TWO STUDENTS.

BY SYLVANUS COBB, JR.

In one of our large suburban towns lived a man named John Atkins. He was one of those men who had made their way to wealth, affluence and honor, by strict integrity and attention to business. Every penny of his great wealth had been honestly earned, and he richly merited all the love and respect that were bestowed upon him. Mr. Atkins was now a widower, and his household was managed by his daughter, a fair, blooming girl of eighteen summers. Her name was Laura, and her beauty and wealth made her the object of a vast number of ardent admirers.

Attached to Mr. Atkin's establishment was a young man named Jared Walker. He was about eighteen years of age, and was the son of a man who had once been in the merchant's employ. When his father died he was left poor and friendless, and Mr. Atkins hired him to take charge of the garden and stable. He had now been with his present patron a little more than two years, and during that time had proved himself not only capable of all things which he undertook, but also most scrupulously faithful and trustworthy.

Not far from the dwelling of Mr. Atkins stood a college—one of the most flourishing and noted in the Union. Mr. Atkins himself had never had the advantage of a college education, but he had yet picked up a vast deal of information, more of real practical information, than a man could gain in a lifetime within the walls of a college; but the old man was a friend to the institution, and he was the best friend to that youth who made the best use of his time.

One summer's evening, while Mr. Atkins and his child were sitting in one of the drawing-rooms, a visitor was announced. He was a young man, and both the merchant and his daughter received him kindly. His name was Albert Landown, and he was the child of wealthy parents. Young Landown, though only about nineteen, was considered the favored suitor for Laura's hand, and from his manner it was evident that he had the same opinion himself. If he possessed any peculiar traits of character they were rather of the negative kind, though perhaps his love of self, and pride in wealth may have been of rather a positive character.

"Laura," said the young man, after the usual civilities of the meeting had been passed, "who is that young fellow that works around your garden here?"

"O, that is Jared Walker. He lives with us now. Don't you remember his father—old Timothy Walker—that used to live in the little black house back of the college?"

"Seems to me I did remember such a name; but I never knew him."

"He used to work for father, but he died a few years ago, and Jared came to live with us."

"Ah—is it possible?" uttered the youth with a condescending air. "Yes it is just like your father, always kind. But this master Jared needs some better manners."

"Better manners!" iterated Laura, looking up with surprise. "Why, I thought Jared was one of the most scrupulous of young men in his manners!"

"Perhaps he is—ah, I don't doubt it. But he actually bowed to me in the street this morning—bowed to me when I was in company with a couple of friends from the South. Really, I felt as though I should sink through the sidewalk. Hadn't you better speak with him, and tell him not to recognize me in the street again?"

"You must excuse me, Mr. Landown, for I couldn't do such errands, even for you. I only wish the rest of the young men in our town needed no more cultivation of manners than does Jared Walker."

This seemed to operate as a sort of damper upon the rising spirits of the young exclusive, and it was some time before he could rally, but at length he managed to regain his wonted speech, and for a while he rattled away at a mass of "small talk," to which his listener only answered by occasional monosyllables.

"Albert," at length spoke Mr. Atkins, laying side the paper which he had been reading, and moving his chair nearer to where the young couple sat, "when do you enter college?"

"Next week," answered the youth with a flush of pride.

"And I hope you mean to improve your time to the best advantage."

"O, certainly," was Albert's reply; but it was spoken in that off hand manner which indicates no great depth of purpose.

"You have great advantages," resumed the old man, "and it behooves you to make the best use of them in your power. I know of many a poor boy who would give half the liberty of his lifetime if he could but have the opportunity for an education that you have."

"Yes—I suppose so," said Albert; and then he added, with a slight laugh, "and I suppose they would like some of my money, too."

"Perhaps they might, but those who are wise would not take the money with ignorance; they would rather have the education, for that is by far the nobler portion."

The old man gave his young friend considerable good advice, but Albert seemed to pay but little heed, and at length the task was given up.

"He is young and inexperienced," said Mr. Atkins to himself, after the youth had gone, "and I suppose don't like too much advice. I know how it is with these fortunate young men; they want age to sharpen their understandings."

The old man had just taken his seat again to read a little more in his paper before he retired, when some one rapped upon his door.

"Come in," said he.

It was Jared Walker who entered the apartment. His face was all tremulous with emotion, and he seemed to be laboring under some great anxiety.

"What is the matter, Jared? What's the matter?" kindly asked the old man, as he noticed the youth's perturbation. "Sit down, sit down, and out with it."

Jared took a seat, and after a few moments of anxious silence, he said:

"I want you to do just as you think best, Mr. Atkins. You have been very kind to me, and God knows that I would not be ungrateful. But I have got a chance to go to another place—a chance to—to—"

"Say on, say on, Jared," said Atkins, showing by his tone and manner that he was disappointed. "If you have found a better place than this, of course I would not keep you. If you can find a better friend than I am, you may go to him."

"O, it is not that, Mr. Atkins," quickly cried the youth. "God knows I shall never find a nobler friend than you have been. But I have got a future to live—I have got a manhood to prepare for, and I may never find another opportunity like the present. But I didn't seek the place, sir—they came of their own accord and offered it to me."

"But what is it, Jared?"

"Why sir, the professors in the college want me to take care of their rooms, and in return they offer to instruct me in all the branches taught in the college. I can have half of every day and nearly the whole of the evening for study. Yet, sir, I will not go if you had rather have me stay with you. You have been very kind to me, and I would not for the world—not even for the education I covet—leave you if you wished me to stay."

For some moments the old man was silent. There was a rich moisture in his eyes, and his nether lip trembled.

"Jared," he at length said, "I think I have been kind to you; but that is no reason why I should now be unkind. You could not have done a thing to give me more real joy than this. I knew not that you had such a desire for learning, or I would have helped you myself."

"And have you not helped me?" cried Jared with enthusiasm. "I have had your books, and I have heard your encomiums upon educated men. I owe it all to you, sir."

"Well, well, perhaps you do. But I will let you go to the college and try the plan you have formed, on one condition."

"What is it?" asked the youth.

"That you will consider my house your home; that you will spend your Sabbaths here, and also such of the holidays as you have to spare. You will have no other home, and this will come handy for you."

It was hard work for Jared to speak, but he managed to promise what his patron had asked, and then he bowed his head and wept. He had not expected such kindness; in his orphaned heart he had laid down the rules of life, but he had not looked for such sympathy and assistance in his hour of need. Each one of those tears that fell from the young man's drooping lids, was a volume of thanks to Mr. Atkins, and he knew it. He saw at once how noble was the heart he had touched, and he felt happier far than as though he had found a mine of gold.

On the first of the next week, Jared Walker took his new situation in the rooms of the college, and on the same day Albert Landown was entered as a freshman. One was poor, the other rich. One came there to study for the future, and the other came because it was fashionable. One came with the determination to *be* a man, and the other came that he might *appear* a man.

At first some of the students were inclined to be uncivil towards the poor youth, for they found that he enjoyed all the opportunities for advancement that they did, but his uniform gentleness and unobtrusiveness, and his quiet upright conduct soon won most of them to his friendship. But there was one in the college who still affected to scorn him.

Early one morning, as Jared was going across the college yard with a bucket of water in his hand, he met Albert Landown. To be sure, Jared was dressed in a working garb, and from the very nature of the work he had been doing, he was somewhat dusty; but still he thought it no harm to speak, and with a bright smile, he bade the other "good morning."

"Stop you a moment," uttered young Landown, turning red in the face. Jared stopped, and set down his bucket.

"Now look ye," continued Landown, "this makes the third or fourth time you have spoken to me since I entered college, and I want no more of it. I thought my silence might have given you the hint, but it seems you are too dull to take a hint. Now don't you dare to recognize me again, for I don't choose to be on terms of intimacy with every floor-sweeper that happens to know me by name."

Jared did not dare trust himself to make a reply, for he was touched to the quick, and he knew if he gave liberty to his tongue he might say too much, so he picked up his pail and started on his way. Perhaps it was well for Jared that this affair happened, for from that moment he was resolved that Albert Landown should not be the best scholar.

Time passed on, and Jared won more and more upon the respect and love of the professors, and they showed their love by rendering him every assistance in their power. Every Sunday he passed beneath the roof of Mr. Atkins, and that kind old man was highly gratified to find how rapid was the advance which the youth made. But yet he knew not all towards which Jared's mind was grasping. Sometimes Jared sat and conversed with Laura, and he was surprised to find how deep and clear was her understanding.

"Have you studied French, yet?" she asked one day, one Sabbath afternoon, as they sat together.

"Not yet," returned Jared, "but I am going to study it."

"That's right," continued the fair girl, "for I am going to study it, and it will be so pleasant to have some one to converse with."

"Will not Mr. Landown study the language?" Jared asked.

"Perhaps so—he says he shall," replied Laura. "But he does not seem to make much of his studies."

The two had been conversing together for some time, but the introduction of Landown's name seemed to strike a chill to the moods of both, and shortly after, they separated. But, it was not their last conversation, for they conversed often, and with mutual profit, too. Sometimes Mr. Atkins sat by and heard them, and he never failed on such occasions to show by his manner that he enjoyed it much. Yet Mr. Albert Landown was regular in his visits, and once he had asked Mr. Atkins for Laura's hand, but the old man bade him wait until he had graduated from college before he thought of such a matter.

Years are not long in passing away, and the college term at length expired. Four years had gone by since Jared Walker first became a servant in the college, and he had now come forth with a well-earned diploma. Even the Professors were astonished at the amount of learning he had managed to amass to himself, and when he received his degree of Master of Arts, those who bestowed it knew that it was given to one well qualified to claim it.

Mr. Atkins was not a great party politician, but he was nevertheless a warm adherent to his political party, and one, moreover, who wielded a great deal of influence. The Presidential chair of the nation had just been filled by a new incumbent, and new appointments were being made. Mr. Atkins was selected to fill the important post of a foreign minister. It was more than he had expected—more than he would have dared to hope for—but it was no more than he deserved, and his superior knowledge well fitted him for the place.

"Well, Albert," said Mr. Atkins, as the young man was at his house one evening, "how stands your education now?"

"O—about right," returned the young man, with a light laugh. "I got through, but 'twas a tedious job. I thank heaven we go through college but once in a lifetime."

"You studied French," I think," the old man continued, not seeming to have relished the previous answer much.

"Yes—I studied it—'twas fashionable, you know, and I had to study it."

"I suppose you speak the language, then?"

"Well, as for that, I don't know. I can read a few sentences, but what's the use?"

"Anything that is worth doing, is worth doing well," said the old man, somewhat severely. "Did you study Spanish or German?"

"I dipped into the Spanish some, but got sick of it."

"Well, I am disappointed."

"Eh!" uttered Landown, starting up.

"I say I am disappointed. You are probably aware that I have received an appointment, and I had some thoughts of making you my secretary, but that is impossible now. I had thought that a residence of a few years in Europe, upon a good salary, would please you."

"So it would—so it would," uttered the young man, turning first pale and then crimson. "Can I not go with you?"

"Not now, Albert," returned Mr. Atkins. "You are not qualified for the place. You have had every opportunity to prepare yourself, but you see you have neglected it. I am sorry, but I cannot help it."

"Will Laura accompany you?" faintly asked the youth, after some moments nervous silence.

"Of course she will go with me."

"But perhaps I could prepare myself before you go."

"No—that would be impossible. I shall start next week."

Sad and dejected did Albert Landown turn his steps away from the dwelling of Mr. Atkins, that evening. But for his disappointment he had no one to blame but himself. The best hours of youthful life he had literally thrown away, and it was now too late to find them again.

"Well, my child," said Mr. Atkins, coming into the house one day, "I am ready to start, and next Monday I shall be off."

He spoke in a very happy and satisfied mood.

"Have you engaged a Secretary?" asked Laura.

"Yes—an excellent one."

"Do I know him?"

"O, yes."

"And who is he?"

"Jared Walker."

"Jared—"

"Jared Walker, I said. How do you like the idea of his going with us?"

But Laura did not answer. She only hung down her head and trembled, while her father could see that she was blushing too.

"He will make the best companion I could have found. He speaks French, German and Spanish with fluency. I hope you will be satisfied. I should have taken Albert Landown, but he was not qualified in the least. Are you sorry for the change?"

"No, no, indeed I am not," murmured the fair girl, hiding her face in her father's bosom.

And so Jared Walker accompanied Mr. Atkins to Europe, where they remained four years, and when they returned, the minister had given up the control of his fair child to his young secretary. Laura had become Mrs. Walker, and a happier bride it would have been hard to find.

Youth's Corner.

ILLUSTRATED REBUS, NO. 39.

☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 43 letters.
My 32, 23, 42, 7, 12 was an Athenian lawgiver.
My 35, 4, 30, 25, 1, 39, 13 is external.
My 34, 21, 6, 20 is the essential oil of roses.
My 15, 38, 9, 43, 19, 33 is eastern.
My 36, 10, 3, 29 was the goddess of youth
My 21, 11, 28, 8, 38, 37, 41, 17 is wearing apparel.
My 18, 40, 22, 14, 42, 2 is royal.
My 16, 26, 31, 5, 27 is pure.
My whole was the saying of Shakspeare.

Leather Ville, N. Y. O. H.

ARITHMETICAL PROBLEM.—A lady went to market to buy fruit. She gave 5 cents for oranges, 4 for lemons, 1 for apples, and 1-9 cent for plums. How many must she buy of each to get 100 for $1? W. Y.

"Breathing Well," Great Valley, N. Y.

☞ Answer next week.

Answer to Miscellaneous Enigma in No. 37.—*Warsaw Academy.*

Answer to Riddle in No. 37.—Is not a *glove handsome*, and might it not to be mated? for it is one, and should be a pair. It has the offer of every lady's hand; and has it not received all the love-letters, L. O. V. E.? and yet one letter too many, G., over-powers the proper emphasis of love. So that as *glove*, it is dumbless all and on with many. Is no bride itself, but cast off at the altar at the moment of to have and to hold. No priest will put on a ring over a glove. As a glove, all desire to see it matched; yet as a glove it must be single, though so many hold out their arms to receive it.

OHIO AGRICULTURAL COLLEGE, AT OBERLIN.

The first term of this College will commence on the first Monday of December, and continue three months—The object is to place within the reach of farmers, both old and young, the means of acquiring a thorough and practical acquaintance with all those branches of Science which have direct relations to Agriculture.

It is proposed to give Courses of Lectures during the winter months, on all the several departments of Agricultural Science, each principal division being assigned to a different Lecturer, and systematically presented in the same manner, as Medical Science is taught in Medical Colleges. The branches taught will embrace whatever pertains to Animals, Vegetables, Land or Labor.

Lecturers.

JAMES DASCOMB, M. D., Chemistry in all its applications to Soils, Manures, Animal and Vegetable Life, and the Domestic Arts, &c.

This department is regarded as especially important, and means have been provided for its thorough illustration.

NORTON S. TOWNSHEND, M. D., Comparative Anatomy and Physiology, with special reference to the feeding and breeding of Stock; History and Description of Domestic Animals in their several varieties; Veterinary Medicine and Surgery—Entomology.

This department will be illustrated by preparations and specimens, and by the practice before the class of such operations as are necessary to be performed by the keeper of stock.

JOHN S. NEWBERRY, M. D., Geology and Mineralogy; Botany, Descriptive and Physiological, with special reference to the history and habitudes of all plants cultivated in the Garden and Orchard, or in the Field—the various modes of culture, and soils adapted to each.

This department will be illustrated by specimens of all the varieties of grains, fruits, and other vegetable products of interest to the Farmer, Gardener or Orchardist.

JAMES H. FAIRCHILD, A. M., Natural Philosophy; Agricultural Mechanics; Farm Implements; Meteorology; Elements of Engineering and Land Surveying; Rural Architecture; Landscape Gardening, and Farm Book-Keeping.

Philosophical Apparatus, Implements, Models, Plans, Drawings, &c., will be abundantly provided, to aid the Lecturer in this department.

The Lectures will commence on the first Monday in December, and continue three months. Four Lectures will be given daily.

ADDITIONAL FACILITIES.

A Reading Room, supplied with the principal Agricultural Periodicals, will be open to students at all hours. They will also have access to an extensive Library.

TERMS.—For the entire Course,.....$40,00

Board and rooms may be obtained at $2 per week, exclusive of fuel and light.

This institution is designed to be permanent, and is therefore incorporated as the Ohio Agricultural College. It is located at Oberlin, Lorain County, Ohio.

Oberlin is easily accessible by the Cleveland and Toledo Railroad. It is only one hour's ride from Cleveland.

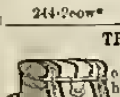
Letters of a business character may be addressed to Dr. DASCOMB, Oberlin, Ohio. 245.

FARM FOR SALE.

THE subscriber offers for sale his Farm, situated in the town of Penfield, Monroe Co., N. Y., two miles north of the village of Penfield, and seven east of the city of Rochester. The farm contains 100 acres, 15 acres in woods.—There is on the farm a large and commodious brick house, barns, out-buildings, &c., sufficient for all farm purposes. Also a large peach orchard and about 300 thrifty, apple trees of grafted fruit. For further particulars address

ARD WEEKS, Penfield,
244-2cow* Monroe Co., N. Y.

TRUNKS AND VALISES.



THE subscriber would inform the citizens of Rochester and the public generally, that he is manufacturing extensively, a very superior article of sole leather and steel spring Trunks, which he will guarantee to be equal to anything made in the United States.

You may see at PRITCHARD'S Trunk Depot and Sales Room, 78 State street, 1650 Trunks and Valises, and he is now adding to this large stock from 125 to 150 per week—among which you may find Trunks varying from one dollar to fifty. If you should want anything in his line, give him a call, for his motto is, "Large sales and small profits."

A. R. PRITCHARD, No. 78 State St.
Rochester, N. Y., Aug., 1854. 240-tf

WOOD AND COPPER PLATE ENGRAVING.

MILLER & MIX, Designers and Engravers, No. 16, third story, Arcade, Rochester, N. Y., will be happy to exhibit specimens of their work, embracing a great variety of book Illustrations, views of public and private buildings, landscapes, portraits, machinery, society seals, &c. Particular attention given to engraving Agricultural Implements, Portraits of Domestic Animals, &c.

Invitation, Wedding, Visiting and Business Cards Engraved and Printed at short notice, and in a style to give entire satisfaction. Orders by mail will receive as prompt attention as though ordered personally. L. C. MIX.
23-tf JOHN MILLER.

TO YOUNG MEN!

And others desiring Employment.

CHANCE TO MAKE MONEY!

MILLER, ORTON & MILLIGAN, Auburn and Buffalo, N. Y., will give immediate, constant, and very lucrative employment to 1,000 agents, to labor chiefly in the Counties where they reside, in selling the most

Popular, Interesting and Useful Books,

published in this country. The list of Books is very large, and embraces a great variety. They are selected and made with especial reference to the wants of the People. They vary in Price from 25 cents to $2 per volume, are neatly and strongly bound, generally illustrated with beautiful steel and other engravings, and embrace History, Popular Biography, Narratives and Travels, Agriculture, Theology, Temperance, Books for the Young, Bibles, Standard Poetry, Law and School Books, &c.

N. B.—Terms, Descriptive Catalogues, Circulars, and full particulars furnished gratis, on application (post-paid) to MILLER, ORTON & MILLIGAN,
Auburn or Buffalo.
Auburn, Aug. 26, 1854. 243-tf

A VALUABLE FARM FOR SALE.

SITUATED in the town of Conquest, 4 miles northwest of Weedsport, a good market on the Canal, and 8½ from Rochester & Syracuse direct Railroad. Said Farm contains 103 acres; 140 improved and in a good state of cultivation; well adapted for all kinds of produce, and will be sold for two farms if desirable, as there are two houses and two barns, two orchards consisting a good variety of fruit, also a wood lot on each end of the farm. Thirty-five acres can be put in to wheat this fall. Said farm can be had cheap; terms easy, and possession given when desired. Stock and farming implements can be had if desirable. For further particulars inquire of the subscriber on the premises.

213-tf JACOB EAKER.
Weedsport, Cayuga Co., N. Y., Sept., 1854.

GAFFNEY, BURKE & CO.,

IMPORTERS, WHOLESALE AND RETAIL DEALERS IN

Foreign and Domestic Dry Goods,

No. 53 Main Street, and Nos. 1 and 3 North St. Paul Street,

GAFFNEY'S BLOCK, ROCHESTER,

Have now in store one of the largest stocks of Dry Goods ever brought to this city, in which may be found every desirable article of Ladies' and Gents' Dress Goods, adapted to the season. Their improved facilities for IMPORTING, and the great advantage of having a resident partner in New York, daily attending the Auction Sales, enable them to offer to Merchants and Dealers, by piece, case or bale, as cheap as can be purchased in the New York and Boston Markets.

WHOLESALE ROOMS NOS. 1 & 3 NORTH ST. PAUL ST.,
GAFFNEY'S BLOCK, ROCHESTER.

Summer Dress Goods.—We have just opened a very large stock of Summer Dress Goods, consisting of a fine assortment of Brilliants, plain and figured Barèges and Tissues, plaid and striped Pongee Silks, Muslins, plain and striped Lawns, Printed Jaconets, &c., &c. The styles are entirely new and beautiful.

KEDZIE'S RAIN WATER FILTERS,

MANUFACTURED BY

J. E. Cheney & Co., Rochester, N. Y.

THE use of water impregnated with lime and other mineral substances, in the opinion of all medical men, is one of the chief exciting causes of many diseases incident to the varied climate of this country.

These Filters have been fully tested, for many years, by hundreds of families in this city and in various parts of the country, and have in all cases given the highest satisfaction.

Rain water, of whatever color, taste, or smell, by this means becomes as clear as crystal. 236-1amlf

FARMERS' AGENCY.

BEING a Practical Farmer, and having considerable experience in the selection and use of Farm Implements, and living in the vicinity of extensive Seed and Implement Stores and Agricultural Implement Manufactories, and extensive Nurseries of the choicest fruit and ornamental trees and knowing the difficulties that farmers have to contend with in the selection of these in the busiest seasons of the year, I will select, purchase and carefully forward anything in the above line for a small compensation. Satisfactory reference given in all cases when required, and the money promptly returned to all cases where the wishes of the sender cannot be complied with. 232-1am-tf

Address I. A. CLARK, Marion, Wayne Co., N. Y.

ENGLISH CATTLE.

To Agricultural Societies, and others requiring the best bred Cattle from England, embracing pure blood Horses, Short Horned Cattle, Devons, Herefords, Ayrshire and Alderney Cows, pure bred South Down, Cotswold and Leicester Sheep, Suffolk, Essex and Berkshire Swine. Imported on commission by Messrs. Thos. Betts & Brothers, Herts, England. For information apply to J. M. Miller, 61 Maiden Lane, N. Y. City, who is fully authorized to act as our agent.

Orders received for Guano, by applying to
231-13t THOMAS BETTS, 35 Wall St.

LAND PLASTER

AT Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground Land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.

227-4m. JIREH ROWLEY.

☞ Mr. C. MOORE, of Gerry, Chau. Co., is authorized to act as Agent for the RURAL NEW-YORKER, and for the WOOL GROWER AND STOCK REGISTER, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$1 a year—31 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to prepay the American postage on papers sent to the British Provinces, our Canadian Agents and friends must add 25 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

. The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. BIXBY,—H. C. WHITE,—T. E. WETMORE.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete AGRICULTURAL, LITERARY and FAMILY NEWSPAPER.

☞ FOR TERMS, &c., SEE LAST PAGE. ☜

Progress and Improvement.

MIS-MANAGEMENT OF HORSES.

Is there anything in the go-ahead temperament of the Anglo-Saxon, which makes him a hard horse-master? The fact cannot be denied that, in Great Britain and America, the noblest of all domestic animals is heartlessly abused. The semi-barbaric Arab admits his favorite mare to all the rights and privileges of the social circle; the Russian serf makes a companion of his horse, talks to him with more gentleness than the rude Anglo-Saxon converses with his brother man. The wandering Tartar instructs his horse with more patient assiduity than he teaches his children; while British and Americans, the inhabitants of the two greatest and most enlightened nations on earth, abuse rather than use their proud, powerful, and willing slave. In England we have seen a collar, hames and appurtenances that would weigh at least a hundred weight, which, with other harness in like proportion, is of itself a sufficient load for all but the most powerful horse. In this country we run to the other extreme, and our collars are frequently without sufficient substance to keep the hames from galling the neck and shoulders. Our horses, too, are generally not strong enough for the heavy work required of them. We are not content with doing what in Great Britain would be considered heavy work for their large horses—turning over a furrow say ten inches wide by seven deep—but, forsooth, must *flap* over a furrow sixteen to twenty inches wide, and ten to fourteen deep, and this sometimes with a single span of horses. After a few days of such overstraining, they will probably be hitched to a buggy or lumber wagon, and driven to the city at the rate of ten miles an hour. When arrived there, they are tied up to a post in the street, where they must remain for several long weary hours exposed to the rays of a scorching midsummer sun. They are then driven Echo-like home again, where, bathed in perspiration, the harness is stript off and they are turned into the pasture. Is this an exaggerated picture? We all know it is not. We would ask, is such treatment humane? Is it profitable?

We like to see horses work, and work hard, but let it be *steady* work, and let every possible attention be paid to the poor animals' ease and comfort. We clean our horses too little. If they get curried down twice a week, they may think themselves fortunate; while regular daily cleaning with comb, brush, or wisp, is never thought of, except by some old-country fogy, that is altogether in the rear of "Young America." Horses in their natural state, the young gentlemen will tell you, are never groomed. True, but horses in their natural state are not subject to artificial treatment; they have no collars to gall their necks and shoulders; they are not forced to labor till bathed in perspiration, which, on cooling, converts their hair into a clouted covering, preventing the due exercise of the important functions of the skin. The domestic horse is in an artificial condition, and needs artificial treatment, to keep him in health and in the right condition to exercise his utmost power.

In regard to diet, we are equally culpable; we furnish food enough, but it is so injudiciously fed out that it is about half wasted. A horse comes in from a long journey, and before his harness is taken off, has half a peck of oats or corn thrown into his manger, which, in his hurry, he swallows without mastication. Better far, let him go without grain till you have rubbed him down, and then a bran mash or moist cut hay and mill feed would be far better than raw grain.

At this season of the year horses need, and will repay in greater efficiency next spring, more than ordinary attention. Grass is now comparatively innutritious, and the nights are cold; and unless the horses receive some dry and nutritious food in the stable, they will lose in a day more than they will regain in a week during the winter months. This year, grain, hay and all kinds of fodder will be scarce and high, and every farmer will, as he should, endeavor to keep his horses as long as possible in the pastures. We should, however, try some method of enabling them to get their fill of grass, without exposure to the night frosts of this season. They will do much better, with less food, in a warm stable, than with abundance of grass, exposed to the inclemency of the weather. A little grain, cut fodder, and careful attention in the fall, will not be lost. The horses will keep in better condition for it during the winter, will consume less hay and grain on the whole, and come out more healthy, and in better condition, the following spring. Avoid new oats, new corn, new peas, &c., unless they are well seasoned. Any soft, moist grain is very injurious to horses, and it would be always better to have on hand some old corn or oats for horses at this season. Bran is a poor food for horses in conjunction with innutritious fall-grass. Dry Indian corn meal, with perhaps a little oilcake meal, is unquestionably the *cheapest* grain for farm horses in the fall. We throw out these hasty remarks more in the hope of calling attention to the subject than of saying anything for individual adoption by our readers.

FALL PLOWING FOR SPRING CROPS.

THE fact mentioned in the RURAL last week, that Mr. EMMONS obtained over 50 bushels of barley per acre, on land plowed in the fall, and simply cultivated and harrowed without plowing in the spring, proves at least, that in some cases good crops can be so obtained. If it were found to be the case, as a general thing, much advantage would accrue from the practice. The fall is the least busy portion of the farmers' working season, while the spring is the busiest. If any work, therefore, which we are accustomed to do in the spring, can be performed in the fall, without injury to the following crop, it cannot but be of advantage to do it in the leisure, rather than the busy season of the year. Barley is well known to delight in a warm, well pulverized, active soil, and if fall plowing, as a *substitute* for spring plowing, answers for barley, it would be very likely to answer for potatoes, oats, corn, and other spring crops. We fear, however, as a general thing, land plowed in the fall is not in as good a condition for putting in spring crops, as though it had been plowed in the spring.

It is true, that English farmers plow one-fourth of all their arable land in the fall.—They do this to expose it as much as possible to the meliorating effects of frost, but we are under no such necessity, our land gets frozen enough without being fall plowed or thrown up in ridges for exposure. Then again, though according to American travelers at least, it rains in England *all the time*, yet, it seldom rains hard enough to wash the land.—JOHN BULL knows nothing of those tremendous rains which deluge our farmers late in the fall and early in the spring. If he did, we believe fall plowing, on sandy soil, would not be so popular with the old gentleman. Again, nearly every farm in England is thoroughly underdrained, and the rain which on an undrained field runs off in surface ditches, carrying in solution and suspension large quantities of the elements of plants washed out of the soil, on an underdrained farm, filters slowly through the soil to the drains beneath, leaving in the soil all the ammonia it brought with it from the clouds. We cannot cite the practice of English farmers, therefore, as evidence that fall plowing for spring crops is a good practice in America.

A clay soil, properly underdrained, would doubtless be much the better for a good, deep plowing in the fall. But we think it would also need another plowing in the spring. On sandy, underdrained soils, fall plowing may be a good substitute for spring plowing, so far as the mechanical nature of the soil is concerned; but we cannot but think, that the fall and spring rains would wash out a considerable quantity of the soluble and most valuable portion of the soil, and more, if fall plowed, than if the ground were left undisturbed, compact and smooth.

There are those, however, who hold a contrary opinion, and we believe fall plowing for spring crops is becoming every year more general. And certainly, no stronger evidence in favor of any practice can be adduced than the fact that it is gradually extending among observing, practical farmers. We should like to have the experience, the experiments, the observed facts—not the theories—of our readers on this point.

GUANO FOR THE SUGAR CANE.

THE *New Orleans Delta* contains the particulars of some experiments with guano on the sugar cane. The guanoed part "turned out the largest and heaviest canes in the field, and produced of first and second clarified sugars 2,500 lbs. per arpent." The same ground had never before produced "more than 1,000 lbs. per arpent." With guano, the experimenter is convinced, no rotation of crop is required to produce the finest and heaviest canes in Louisiana." Another planter, who had used guano, says he "never saw a heavier stand and higher canes in this State than the guano canes." From the great increase obtained from the application of ammoniacal manures to wheat and other *cereal* grains, we have long been satisfied that they would prove equally beneficial to the *cereal* sugar cane, while, from the large quantity of cane obtained per acre, and the comparatively high price of the sugar, they would afford a profit which wheat-growers could not hope for.

MUTTON SHEEP.—THE SOUTH-DOWNS.

THERE is a vast difference in the quality, as food for man, of the flesh of the different breeds of sheep, and that above named stands among the best, when mutton is the principal object. A writer in the last Patent Office Report describes them as follows, "The South Down is what is known in England as the fine mutton sheep, the quality of which is so famous, the lean and fat being well mixed. The wool is of medium quality and will always find a ready sale at paying prices. The South Downs mature early, keep easy, stand almost any climate, and the ewes are great milkers which advances their lambs rapidly."

The last Volume of the Transactions of the Wisconsin State Ag'l Society, contains a statement made by the exhibitor of the premium "Middle Wools," as follows:—"On several accounts, for this country, I prefer the South Down sheep to the Merinos. They are hardier, have stronger constitutions, and are better calculated for mutton—averaging at least one-third larger size than the fine wool Merinos.—For feeding, they are unsurpassed; producing a superior quality and greater weight of flesh from the same feed than any other sheep. The ewes are very prolific. The lambs, when young, are stout and healthy—much easier raised in cold weather than fine-wool lambs.

I prefer them to the Leicester or Cotswold. They cut nearly the same quantity of wool, and of a finer quality; and with the same feed will produce as much flesh and of a superior quality. They do not require as much protection from the storm, on account of the compactness of the fleece. They are far superior, in crossing with the fine wool sheep."

The Cotswolds and New Oxfordshire Downs are also warmly recommended as Mutton Sheep

PREMIUM SOUTH-DOWN EWE.

by those who have bred them. We do not undertake to decide between the different varieties; we are only anxious that the best mutton sheep may become plenty,—for we believe that it would be well for the country if this meat were generally in use, instead of so much pork and beef as is now consumed.—D.

AN INTERESTING LETTER FROM IOWA.

EDS. RURAL:—I noticed in your paper of July 15th, inquiries in regard to the agricultural, manufacturing and education interests of Iowa; and as you request some of your readers from this State to answer them, I send a few facts relating to the subject, which may interest some of your numerous readers who are turning their thoughts westward. I came from the "Genesee Valley" nearly three years ago with about as indefinite ideas of the west, and prairie country in particular, as people brought up in the eastern States generally have. I know, consequently, something about what kind of information people need who contemplate "coming west."

In looking westward for a future home there are several important matters to be considered, some of which are very often overlooked. The first and most important matter to be considered should always be—is it healthy?—is its location such that it will soon become populous, and consequently valuable?—is it likely to be settled by people we would like for neighbors?

By consulting the map it will be seen that of all the western States, Iowa occupies a situation which is destined at no distant day to render it a State of the first importance. It is on the direct line of the great railroad which must soon connect New York with San Francisco, of which about one-half is now completed, connecting Davenport with New York, and is now pushing on rapidly towards Council Bluffs. It lies between the two great rivers of the continent—the Mississippi and Missouri; and thus it will be connected by railroad with the Atlantic and Pacific, and by the great rivers with every State in the great valley from Minnesota to the Gulf of Mexico. With its numerous navigable rivers extending inland, its four or five railroads now progressing westward from the Mississippi through different parts of the State, opening a communication to all parts, it will soon be unsurpassed in facilities of communication with all parts of the country. Its agricultural advantages are proportionately great, for no State can offer greater inducements to the tiller of the soil, whether on a large or small scale.

The whole State is one vast rolling prairie, interspersed with groves of timber scattered through it at intervals of from three to ten miles, and belts of woodland bordering on all the large streams and rivers.

In the southern part of the State the general surface of the prairie is level, resembling that of Illinois, and is consequently more affected by dry or wet weather than rolling land. Through the middle of the State, westward from Muscatine, Davenport and Lyons, the surface is gently rolling or undulating—is well drained by sloughs and ravines, which carry off all surplus water, rendering the country dry, pleasant and remarkably healthy. Farther north the surface is more uneven, the sloughs deeper, ravines more abrupt, and the soil more liable to wash. There are generally three kinds of soil in a prairie country. Prairie soil proper is of a dark brown or black color, loose, light and entirely free from grit,—requiring all kinds of tools used in it to be made of steel, and is considered the best for all kinds of produce that can be found in the country. Spring wheat, corn, oats, potatoes, and all kinds of fruits, with the exception of peaches, are considered certain crops on this soil. The land bordering on timber is generally covered with short, stunted trees and bushes, and is called "barrens," the soil of which is a light colored clay, and while not as good for other crops, is considered better for wheat than prairie. There is also sandy prairie in many parts of the State, but is generally avoided by those who are acquainted with it, from the fact that it does not wear well. It will produce large crops of corn while new, but soon needs manuring. Rolling prairie will be found much more satisfactory to the farmer, in all seasons and under all circumstances, than any other description of soil that can be found, for the reason that it is so well drained as seldom to be affected by the most severe drouth or most protracted freshets. While level prairie is parched up through the long dry spell that often succeeds the spring rains, our beautiful rolling prairie is almost entirely unaffected, producing bountiful crops. One reason of this is, our land is in tillable order as soon as the frost leaves the ground; and another is, that land *well drained* seldom suffers from drouth. While level prairie is deluged with water, our rolling land is receiving its seed in good condition, and crops are getting a start which enables them to withstand the severities of midsummer drouth. B. F. O.

Spring Rock, Scott co., Iowa, Sept. 9, 1854.

STOCK ON HIGHWAYS.

THE Revised Statutes of this State, 3d edition, page 389, give to the inhabitants of towns the right to "determine the times and manner in which cattle, horses or sheep, shall be permitted to go at large on highways."—Now, if the statute is correct, then swine, legally have no right on highways, because not mentioned by the statute. But may *not* animals be pastured on the highway, lawfully, with or without a town by-law, permitting them to run at large? Is not the statute in conflict with the Constitution, which says, (Art. 1. Sec. 6,) "nor shall private property be taken for public use without just compensation?" Is not the highway private property? Let us look at the decision of the courts.

Johnson's Reports, 2, page 363, says—"The general rule is, that the fee of a highway belongs to the owner of the adjoining ground, and that the sovereign has only a right of passage. It is a servitude or *easement*, and trespass will lie for any exclusive appropriation of the soil." Similar decisions may be found in 12 Wendell, page 99; 2 Cow. Reports, page 78; 12 John. 433; 3 Wen. 142 to 147; also, Cowens' Treatise, Vol. 1, page 423 and 430.

That section of the statute seems to refer to such towns only as have common lands; the *property* of the town in its corporate capacity, with which, of course, the town can do as it pleases.

In the case of Holladay vs. Marsh, 3 Wen. 142 to 147, Chief Justice SAVAGE says, "Suppose a case where the town has no common land and they pass a by-law, permitting cattle to run at large—where are they to run? Surely not on individual property. Where then? in the highway? The public have simply a right of passage over the highway; they have no right to depasture the highway. The owner of the lands through which the road runs is the owner of the soil, and of the timber, except what is necessary to make bridges, or otherwise aid in making the highway passable, and if the owner of the soil owns the timber, why not the grass?" Now, if "the soil used as a highway is the private property of the owner of the adjoining ground, and he may maintain trespass for an injury done to it the same as if it were a part of his enclosed and cultivated field," then it is not safe, and certainly not neighborly, to use the highway as a pasture-field. H.

Gates, N. Y., August, 1854.

IMPORTANCE OF VEGETABLE MATTER.

Messrs. Eds:—I see that an agricultural paper approves of sowing timothy seed without clover; per contra, some of our best farmers say if you want to keep a heavy soil light, friable and lively, as well as rich in organic matter, sow clover seed without timothy, and plow it in when in full bloom. Again, clover when cut early and cured in cock is worth as much for hay as one-half the timothy that is cut after harvest, with nearly all its seed shelled off, yet there is no doubt but that early cut and well cured timothy hay is worth much more than clover; but it is a much greater exhauster of the soil. While clover collects ammonia from the atmosphere, timothy like the cereals exhaust the soil of its ammonia. Hence in an economical point of view, would it not be better for farmers to grow less timothy, substituting clover with corn fodder, some Indian meal, &c? I have long been of the opinion that timothy hay was the dearest of all food for a milch cow.

I believe that Messrs. Lawes and Gilbert's theory goes rather to degrade the importance of carbonaceous matter in the soil as a necessary means of supplying carbonic acid to the roots of growing plants; I think they hold that if the soil is not deficient in inorganic constituents, and is well supplied with the compounds of nitrogen, the atmosphere will supply carbonic acid, with that incidentally in the soil, sufficient for a maximum crop. While I admire the anti-Geison theory of those gentlemen, so far as they go for other and much more nitrogen than the atmosphere supplies to plants, I cannot but feel from the result of every day's experience, that Liebig is more than half right when he says, "If plants receive by their roots three times the amount of the carbonic acid absorbed by their leaves in the same time, their increase in weight will be four-fold, provided all the conditions exist for the assimilation of the carbon; hence four times the quantity of stems, leaves and buds must be formed, and by the increased surface thus obtained, the plants will receive in the same degree an increased power of absorbing food from the air; and this power remains in activity long after the supply of carbon to the roots has ceased." But that this supply of carbonic acid to the roots does not cease until the perfected plant no longer requires it, I can show by the following experiments:

On the 13th day of last June, Indian corn was planted near this village in a recently drained swamp on a black carbonaceous soil, apparently deficient in both sand and alumine; this muck was from three to five feet deep, resting on a coarse, yellow clay. In a season so hot and dry that its counterpart was never before witnessed here, this corn grew in less than seventy-five days to be a perfect crop; some of the ears, eight-rowed yellow were filled to the tip end of the cob. Half a mile off in the same swamp carrots are growing, eighteen inches long; how much longer they will grow before the advent of frost remains to be seen. Some may say that the clay bottom held a supply of water which was appropriated by the incumbent soil; so far from it the clay was dryer than the carbonaceous matter above; during the drouth, water in this region was not present, even in the bottom of wells dug to a depth of thirty-five feet.

I have long since noticed that a drained carbonaceous soil rich in humus, always contained enough of ammonia and inorganic matters for the production of large Indian corn. If it was the excess of free hydrogen in the soil above noticed, which formed water with the oxygen of the air, that fed this growing corn, why was not the same effect produced in those well-drained, highly manured soils, where hydrogen is always present, both free and combined with nitrogen as ammonia? Is it not because that atmosphere of carbonic acid is wanting in extenso, on the artificially manured soil, which Liebig tells us, is capable of increasing vegetable growth four times greater than that of plants which receive their carbon solely from the atmosphere? Hence the practical wisdom of our farmers in their practice growing clover for manure without stint, as both a chemical and mechanical renovator and amendment to a worn soil. S. W.

Waterloo, N. Y. Sept., 1854.

Potatoes in Ireland.—The Belfast Mercury says, "the magnitude of the crop for 1854 is certainly very much beyond that ever before known in this country. Taking a low average, we should say that the gross value of Ireland's potato lands this season cannot be under £15,000,000."

Ireland contains now not more than six millions and a half of inhabitants, and the potato crop for the present year is estimated to be worth seventy millions of dollars, or rather more than ten dollars for each man, woman, and child. It is manifest, therefore, that the simple article of food in Ireland is still the potato, and that if it fails, great suffering is inevitable. In the province of Ulster alone, there are 330,000 acres in potatoes, and if even one tenth of the crop should be lost, it will be severely felt.

One animal well fed is of more value than two poorly kept.

Agricultural Miscellany.

MONROE COUNTY FAIR.

The Agricultural Fair for this county came off on Friday and Saturday of last week. The fair was well patronized so far as visitors were concerned, and an unabated interest shown in the community for such interesting and meritorious exhibitions; but the display in most departments was inferior to many of its predecessors, and we might add, county cotemporaries. There are elements and means in Monroe county sufficient for a fair that cannot be surpassed; and it is to be hoped next season they will be called into requisition.

The show of domestic animals was very creditable; of fruits and vegetables, fair; of agricultural implements, such as reapers, drills, straw cutters, &c., good so far as it went, but not extensive; of dairy products, excellent; of domestic manufactures, meagre; and of the fine arts, with a very few exceptions, not worthy of "honorable mention."

The first day was principally devoted to the exhibition of animals, which were then removed and not on the ground the second day, a matter much regretted by spectators. The chief attractions of Saturday were confined in the tent, and many a mouth watered for a taste of the splendid fruits; many a pair of handsome lips were tempted to kiss the blushing cheeks of mellow peaches, and luscious pears; many an eye grew dim with tears at sight of a temple of Pomona, constructed of red and yellow onions!

—The Treasurer of the Monroe Co. Ag. Society, will be at the store of J. Ripalje & Co., Rochester, on Saturday, 30th inst., to pay the Premiums awarded at the Fair.

Stock at the Vt. State Fair:—The show of Cattle was very good,—the best the Society has ever given. Mr. Stickney, of Grafton, had a very fine *Devon* bull, six years old.—Messrs. Sanford, Davis, and others also presented stock of this blood. Mr. Smith, of Wilmington, exhibited a *Short-horn* bull which was much admired by all. He is 6 years old, and of a large size—weighing, it is stated, 2,300 lbs. Other good Durham stock was shown. There were but few *Alderneys* and *Herefords*. About 200 yoke of Working Oxen were on the ground, adding much to the general interest of the show. A very fine pair of fat oxen were shown by Josiah Fogg, (not *Forbes*, as stated last week) of Deerfield, Mass., and another, still larger, by Mr. Fairbanks, of Springfield. The latter weighed six thousand pounds.

Niagara Co. Fair.—The Annual Fair of the Niagara Co. Agricultural Society, will be held at Lockport on the 4th and 5th of October. The *Niagara Democrat* says:—"With a soil unsurpassed by that of any county in the State; with the improvements in agriculture and stock, (especially horses, sheep and hogs,) that have been rapidly progressing in the last few years; with fruits as fair and of as good quality as can be produced in the State, we should have a good show, and we can have, if the right spirit prevails with those who can make it such." The affair will, no doubt, be an interesting one.

Breadstuffs from California.—The tables are now turning. A letter from San Francisco, dated August 1, says:—"The ship S. S. Bishop, which cleared yesterday for New York, has some 12,000 bushels of wheat and barley on board; and another vessel loading takes about the same quantity to England. This promises to be an immense trade ere long.—All kinds of grain are extremely low with us now.

Mr. William Root, of Sweden, informs us that his wheat-crop this year averaged 30 bushels per acre. Last year it averaged 36 bushels, and the year before 34 bushels. The farm contains 120 acres, and 30 acres are annually sown to wheat.

The Le Roy Town Fair will be held at Le Roy on the 10th of Oct. A *good time* is anticipated, although the drouth has been rather severe on Stock, as well as Fruit and Vegetables.

A new kind of wheat has been introduced into California from Sonora, which it is said will, in its yield, surpass any other variety, being free from rust and smut, and maturing a month or six weeks earlier. This will, it is thought, be peculiarly adapted to the climate of California.

A farmer in France stuck a pen into a potato, and planted them together in March. The pen produced a stalk which was covered with pods, and the potato gave eleven healthy roots. He thinks by this means double crops may be obtained and the potato disease prevented.

Early fall plowing is recommended for sandy land, while late fall plowing is said to be the best for clayey soils.

FALL PLOWING.

Eds. Rural:—Fall plowing I think an important item in farm operations, for past experience has taught me that better crops of barley and oats may be secured, *on many of our lands*, by plowing in the fall, and we can invariably get them in in better condition. I consider it indispensable, however, that no surface water be allowed to remain long, and neglect in this respect I believe to be the cause of so many failures in the experiment. Some say, "plow dry lands, but you must not plow those which are wet;" but with all deference to the opinions of such, I (from past experience) advise to the contrary.

If I have a rather wet, clayey lot, which is intended for spring crops, I by all means plow in the fall; not, however, in an indifferent manner, as is the practice of some, but with great care, putting it in narrow beds, and cutting cross furrows or ditches, in order that all the surface water may quickly run off and not lay upon the land to harden it. In this condition the legitimate effect of the frost is to pulverize the soil, and when spring comes, once harrowing, and then going over it with the wheel cultivator, will put it in as good condition for sowing as it possibly can be.—S. B. F., *Royalton, Niagara co., N. Y.*

THE TRADE IN WOOLEN RAGS.

Henry Stevens, writing from Barnet, Vt to the *N. Y. Tribune*, says:

It is a fact that large quantities of woolen rags, also wool made from rags, are now and for several years have been imported. We have in our own country rag speculators; they buy the woolen as paper rags. Woolen rags are worth from four to six cents per pound in the dirt. The rags are sorted, then by machinery converted into wool. Rag wool is now selling from 20 to 28 cents per pound. A neighbor of mine, a few days since, imported from Montreal seventeen tons of woolen rags. From these rags he makes about 400 pounds of wool per day. About ten days since he bought in Boston 23,000 lbs. of wool imported from France. This will soon be manufactured into stocking yarn and sent to market.

We shall soon be flooded with woolen rags. By the late treaty rags from Canada come in duty free. I believe that there will be 30,000,000 pounds of woolen rags made into wool, then manufactured into cloth, stocking yarn, &c., the coming year in this country. Every pound of this rag wool takes the place of so much of our native wool. The cloth sells to good advantage, and is quite cheap and durable. This helps to account for low prices.

SOWING GRASS SEED IN THE FALL.

Messrs. Editors:—There has been what farmers term a "bad catch" this season in consequence of the long drouth, and we shall have a light crop of grass on our new land next year, unless we replenish the ground with seed. Some farmers plow in their stubble, and plant or sow the piece again, but I do not favor this method. I believe it to be injurious to the soil, unless we supply it well with manure: and in doing this, the rotation of crops is broken up, and other positions of the farm suffer, thereby. A better way I think is, to re-sow in the fall; some farmers in this vicinity for several years past have been in the practice of not sowing their grass seed till fall. They plow in their stubble and sow their grass seed usually in the month of September, and they have seldom failed to get a "good catch." Seed sown at this time has not to pass the fearful ordeal of a drouth before the tender plants have become firmly rooted. The stubble well plowed in is equal to a light coat of manure. But still, I do not think it always best to plow a piece which is well laid down. I find on examination, that in my fields laid down last spring, there are many clover roots still alive; I wish to preserve them, and shall sow my seed on these pieces without plowing or harrowing. I intend to do this later in the season, and before a big storm, if I can divine by my observable prognostics and my old family almanack when it is coming. In every instance, which has come under my observation, seed sown in this way has come well, and there has been no lack of grass on such pieces the next season. If any have doubts of the efficiency of this method, I would say try a small piece, that you may satisfy yourselves.—J. Fellows *in Boston Cultivator.*

Hops.—A large portion of the crop has already been picked. It turns out, in all the districts of this county—and, so far as we are informed, in other counties—full as well as appearance six weeks ago justified; while in some districts it considerably exceeds the expectations of growers. Prices have advanced to 35 cents, and few are willing to sell at that. The partial failure of the English crop has principally contributed to this result—so desirable to American growers. It is now pretty certain that prices will not go below the above figure; and brewers who delay purchasing, with the expectation of buying for less, will repent the mistake they have made for two or three years past. One firm in this place, sold 300 bales on Saturday last, growth of '53, for export, at 34 cents; several sales have since been made in New York city, at prices two to four cents higher.—*Cooperstown Journal.*

Profitable Crop.—The Watertown (Jefferson county) *Democratic Union* says that Messrs. T. A. & A. P. Smith, of that town, have the greatest crop of hops ever known in the country. It is estimated by competent judges, at 30,000 pounds. Hops are worth from 25 cents to 30 cents per pound. This crop grew on 20 acres of land.

AN ENGLISH SEED DRILL.

The *Mark Lane Express* gives the following description of Hornsby's celebrated seed drill, which received the first premium at the recent Fair of the Royal Agricultural Society. After stating that the drill can be adjusted to accommodate all shapes of unevenness of land, it says:

"This is truly a masterpiece of simple mechanical contrivances for the work required, and does great credit to the eminent firm who have carried away the prize with it on so many occasions. The peculiar advantages of this drill are the corn or seed box being supported in the centre, which by means of a screw at one end can be raised or lowered endways as the drill travels, so that the box is kept quite level when the drill is traveling on the side of a hill, at an incline of one foot in six, ensuring as regular a delivery of corn or seed as if traveling on perfectly level ground. It has the patent India rubber tubes for conducting the seed to the coulters, and also two coulter-bars to equalize the pressure upon each coulter.—The great superiority of the exhibiter's patent India rubber tubes over the usual tins has now been fully proved in their very extensive use for four years. It is obvious that the seed is first delivered by the seed-cups with perfect regularity; and the only possible cause of its reaching the ground irregularly, or in patches, as is so frequently the case, is the very imperfect delivery afforded by the tins. The more motion of the drill and the form of the tins cause the seed to rebound from side to side until deposited necessarily at varying intervals in the soil. The adoption of this patent entirely does away with the numerous tin cups working within each other, and substitutes simply the continuous and almost indestructible vulcanized India rubber tubes, through which the seed passes, protected completely from both wind and rain, even in the most boisterous weather, directly and with unerring regularity into the channels made by the coulters. To this drill is fitted the exhibitors' improved patent fore-carriage, steerage. Before the introduction of this patent, the fore-carriage steerages in general use required so much power to hold them, that when the wheels came in contact with a large clod or stone, even a strong man could not possibly prevent the drill from swerving. This defect is obviated by the use of the exhibitors' improved patent rack and pinion, obtaining such a leverage that a strong lad's command over the drill is so complete that the obstruction of the wheels by stones and uneven surfaces has no effect upon the steerage, which passes over almost imperceptibly."

HARVESTING BEANS.

As the time for harvesting beans is near, and as it is somewhat difficult to cure them properly, I will state my practice for several years past.

Pull them when most of them are ripe, shake the soil from the roots, and lay them on the ground, roots up, to wilt, or partially dry.—Cut crotched sticks about two feet long below the crotch and 4½ feet above, sharpening the lower end. The two branches should not separate abruptly, but very gradually; so that at the top they may be about ten inches apart; they should be less than two inches in circumference at the top. Stick them up in the margin of the field, or where it may be desired they should stand awhile. Stack the beans in these crotches, by placing a very few, (if the angle at the crotch be very acute,) so that they pinch in the stick just above the roots. Then place a few more with the tops opposite to the first. Continue placing alternate layers, enlarging the quantity in each layer as the parts are more distant, to a convenient height, say four feet, and bind the tops of the stick together. If rain is expected, put on a straw cap, or some other covering. The tops of the beans projecting in different directions and drooping a little, they will not be much wet in quite a rain, if it is only turned at the top.

These stacks can be taken up, laid in a cart, and set away in the barn when dry, with very little waste. When threshed the sticks can be saved for another year. Should it be difficult to find suitable crotches, two stakes with a pin through them about eighteen inches from the ground, so placed that the tops will be further apart than the bottom, will answer the purpose. —*Farmington Chronicle.*

Philosophy of Cutting Potatoes before Planting.—Well tested experiment has proven, that where an Irish potato is to be cut, it should be cut at least ten days before planting. They should be cut and spread on a floor, where they can dry, but not in the sun. The philosophy of the matter is, that a sound tuber is better to plant than an unsound one, and the potato being spread in the air, the starch in the potato forms a skin or cuticle, over the wounded part, which, when planted, retains the nourishment in the tuber to sustain the young rootlets, and the young stem. A potatoe cut and immediately planted, bleeds in the earth, and parts with much which would nourish the growing plant.—*Soil of the South.*

Planting for Posterity.—"There," said a gentleman to us one day, pointing to a group of evergreens and other trees, "my brother is about to build him a house; those trees were planted for him by my father upward of twenty years ago." How fortunate this man to have such a father. Here he builds his house among these fine trees, and enters at once upon their enjoyment. He gains twenty-five years of time, and not only that, the plantation has a ten-fold value in its history and associations it is a family monument. A beautiful example this for fathers. Such an inheritance has a moral as well as material value.—*Horticulturist.*

It is said that small twigs of cedar chopped fine and mixed with their grain, will cure a cough in horses, and that this has been used with complete success.

WHEAT CULTURE IN THE UNITED STATES.

The introduction of wheat into the North American colonies dates back to the earliest periods of their settlements by Europeans. It was first sown, with other grains, on the Elizabeth Islands, in Massachusetts, by Gosnold, at the time he explored that coast, in 1602. In 1611, wheat, as well as other grains, was also sown in Virginia, and by the year 1648 there were cultivated many hundred acres in that colony. Although premiums were offered as an encouragement of its growth in 1631, it was not much cultivated for more than a century after, in consequence of the ill-directed attention to the culture of tobacco.

According to the records of the "Governor and Company of the Massachusetts Bay, in New England," there were ordered from England, in 1629, wheat, barley, oats, rye, beans, peas, the seeds or pits of fruits, (apple, pear, quince, peach, plum, cherry, pomegranate, and filberts,) saffron, woad, liquorice, hemp, flax, potatoes, (sweet?) madder and hop-roots, and the cuttings or plants of the currant.

Wheat was introduced into the valley of the Mississippi by the "Western Company," in 1718, where, from the careless mode of cultivating it by the early settlers, and the sudden alternations of temperature, it would only yield from five to eight-fold, running to straw and blade without filling the ear. In 1746, however, the culture had so far extended that 600 barrels of flour were received at New Orleans from the Wabash; and by the year 1750, the French of Illinois raised three times as much as they consumed, and large quantities of grain and flour were sent to the same place.

Prior to the Revolution, the primitive soils of New York, New Jersey, and New England appear not to have rewarded the cultivation of this grain much, if any, beyond the wants of the inhabitants. Considerable quantities were raised on the Hudson, and in some parts of New Jersey and Pennsylvania, which were exported to the West Indies and New England, and to Great Britain, France, Portugal and Spain, in the years of scarcity, previously to 1723. In 1750, New Jersey raised more wheat than any other colony.

In New Hampshire, for several years preceding 1792, Siberian wheat produced good crops whenever the seed was renewed by fresh importations from Siberia by the way of England; otherwise, it degenerated. On the "intervals lands" along Connecticut river, it yielded from 40 to 50 bushels to an acre; on common uplands, about 20 bushels.

The amount of flour exported from New York in 1749–50, was 6,721 tons, besides the grain, estimated by the bushel; in 1756, 80,000 barrels. From New Jersey, in 1751, 6,424 barrels. From Philadelphia, in 1752, 125,960 barrels, besides 86,500 bushels of wheat; in 1767, 198,516 barrels, besides 367,500 bushels of wheat; in 1771, 252,744 barrels; in 1772, 284,827 barrels; in 1784, 201,305 barrels; in 1787, 193,720 barrels; in 1791, 315,785 barrels. From Savannah, in 1771, 7,200 pounds. From Virginia, annually, for some years preceding the Revolution, 800,000 bushels of wheat. From City Point, in 1791, 10,090 barrels of flour, besides 165,635 bushels of wheat; in 1793, 28,877 barrels, besides 88,115 bushels of wheat; in 1794, 5,853 barrels, besides 31,212 bushels of wheat.

The total amount of flour exported from the United States, in 1791, was 619,681 barrels, besides 1,018,339 bushels of wheat; in 1800, 653,052 barrels, besides 26,853 bushels of wheat; in 1810, 798,431 barrels, besides 325,924 bushels of wheat.

According to the census of 1840, the wheat crop of the United States amounted to 84,823,272 bushels; of 1850, 100,485,944; showing an increase of 15,662,672 bushels. The entire crop of 1853 may be safely estimated at 110,000,000 bushels, and valued at $100,000,000. *Patent Office Report.*

Inquiries and Answers.

Chicken House.—I wish to ascertain from you or some of your numerous subscribers, the best plan for a hen house, size of yard, &c., for say 200 fowls. Also some hints in regard to their management.—A Subscriber, *Orange Port, Niagara Co., N. Y.*

Multicole Rye.—Please inform a subscriber where the Multicole rye can be obtained, and what would be the price?—Thorn Hill.

We know of none for sale anywhere.

Plan of a Barn.—Will some of your numerous correspondents give a plan for a barn about 30 by 50 feet, that will be adapted to a grain and stock farm, giving the details, &c., &c.—S., *Mannsville, N. Y.*

Plaster on Wheat in the Fall.—In reply to our request for information respecting the value of plaster for wheat, Mr. D. S. Meriam, of Nunda, Livingston county, N. Y., writes us that last fall he sowed two bushels of plaster per acre on part of a field of wheat, and on the other part which was considered the best land, he put nothing. The plaster part of the field gave 18 bushels while that which was not plastered produced only 10 bushels per acre. Mr. W. finds the fall, in all cases, the best time to sow plaster.

Tile Drains, &c.—*Reply to S. L.*—The office of small tile or pipe, is to take off surplus water as it slowly percolates through the soil. If used for kitchen sewers they clog and fill up with ends of dish cloth and other refuse which will get into the drain without extra care.—Of course strips of boards should first be nailed to the planking, and the lath nailed to the strips so that the mortar may clinch.—G. B.

Orchard and Garden.

LEAF BLIGHT IN PEAR TREES.

Mr. Moore:—In my Nursery operations, I have paid particular attention to growing pear seedlings, which, even with our best and most skillful tree-growers, is attended with extreme difficulty, owing to a disease which attacks them during their first year's growth from the seed. And, indeed, Downing once stated to me that he had never been able, with all his skill, to grow one thousand good pear stocks from seed. I once had 80,000 young pear trees perish in a season from this cause, and ever since, for ten years, I have made the pear tree my study—no peculiarity in any case where the tree has come under my observation, has escaped my notice. These trees, even when they recover from the blight, present a sorry appearance for years, not possessing a healthy constitution, owing to a disarrangement of their functions while in a growing state. What nurseryman does not know that by depriving a tree of its leaves when in a growing stage in July, that it loses its vigor in the next year's growth; and the bearing tree, if it loses its leaves in the summer of one year, will not produce fruit the next.

By experimenting, I have made an important discovery, by which every nurseryman in the United States can grow his own pear stocks, without risk of failure. Not a spot of leaf-blight will show itself during the first year's growth, even if these stocks grown in my manner are surrounded by thousands in a dying condition from the effects of blight.—What I now state is true; and, further, I can grow them three feet high the first season from the seed. I ask a reasonable compensation from our nurserymen, or the promise of one when this thing is tested to their entire satisfaction by their growing stocks for themselves after my method. L. Hildreth.

Big Stream Point, Yates Co., Sept. 15, 1854.

NEW ENEMY TO THE APPLE TREE.

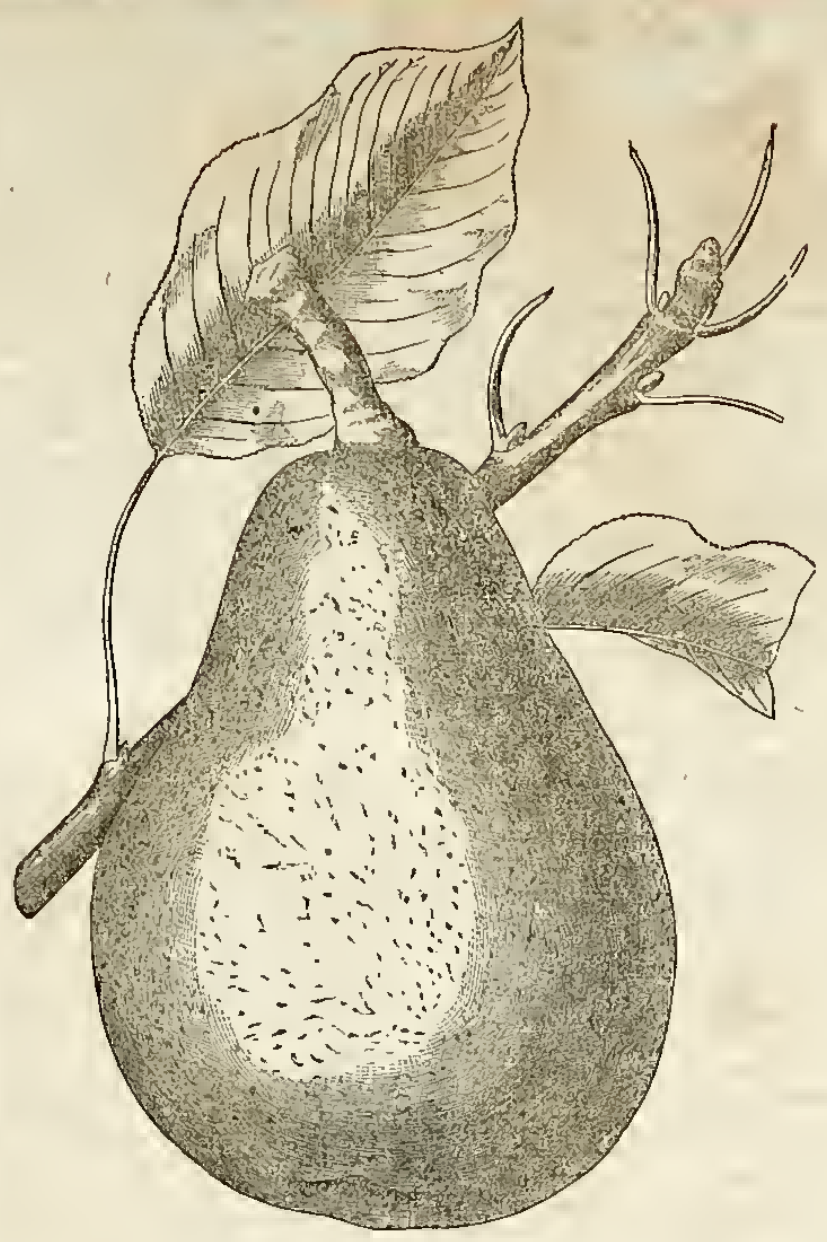
Eds. Rural:—In the spring of '53 I planted an orchard of apple trees, and by attention to tillage, washing with soap-suds, &c., their appearance this spring was as promising as I could wish. A coating of coarse manure being applied to ward off injury from drouth when planted, the field was sowed with barley, followed by wheat. I observed when harvesting the wheat, that several trees showed patches of bark of suspicious appearance, and a few decidedly so; but feeling that any injury causing such effect was past remedy, I dismissed the matter till more at leisure. I now find that wherever the bark is discolored or dead, that a worm in various stages of growth, from a nit to three-fourths of an inch in length, is making rapid separation between the bark and the wood, leaving the space traversed by them filled with a snuff-like powder. The worm or grub is white, and the largest are disproportionately large in front. The large fly commonly called the "Devil's Darning-Needle," would give a fair idea of their form. In some cases their attack would seem to have been invited by a break in the bark by former trimming, but quite as often they are found under smooth-bark where no puncture indicates their means of ingress.

As Rochester is the grand emporium for fruit trees, and in the immediate vicinity of nurseries, many of your readers and correspondents can confer an important favor by pointing out an effectual remedy for an evil, which if not as yet general, is likely soon to be. Archibald McVean.

Inverness, Livingston Co., N. Y., Sept. 20, 1854.

Allen's Hybrid.—The horticultural friends of Mr. J. F. Allen, have been for some years aware that he has been experimenting, to produce a hybrid grape, possessing the requisites which no one hitherto has combined, of sure and early ripening, rich flavor, abundant crop, and freedom from "foxiness." All lovers of good fruit will be gratified to learn that his long and patient efforts for this object have at length been crowned with complete success.—He has obtained a white grape, of the full size of the Isabella, of a flavor unsurpassed by the best hot-house grapes, totally free from the "foxy" taste and smell, and which ripens securely by the middle of September. He has also a purple grape, possessing similar qualities, but not quite so early.—*Salem Gazette.*

Freak of Nature.—A friend gives us an account of a singular freak of nature which he has observed in his garden this summer. Some time ago a sprout came up from the root of a rose-bush, and some two or three weeks since, when it had attained the height of twelve or fourteen inches, a bud appeared directly on the top of the shoot. Just as the bud began to open, the shoot pushed right up through its center, and grew, while the flower was maturing two or three inches more. A few days ago, he noticed that there were four buds on the bush, through the principal one of which the sprout is again making its way. The leaves of the former flower, though wilted, not having fallen off, he has thus a rose-bush which presents the singular sight of two flowers *strung on the stem.*—*N. E. Farmer.*



THE BEURRE CLAIRGEAU PEAR.

This is a new French variety, originated by M. Clairgeau, of Nantes, and sent out from the French nurseries in 1848 or '49, we believe.—It is a very large fruit, and so far as it has been tested, both in Massachusetts and New York, gives promise of being a valuable acquisition. Col. Wilder sent us the following description among his notices of new pears that promise well.

"Size—extra large. Form—oblong, ovate pyriform, outline a little irregular. Stem—short and stout, set obliquely and without much depression. Calyx—open, segments short, moderately sunk. Color—brownish green, coarsely clotted and almost entirely covered with russet, sometimes intermixed with dull red on the sunny side. Flesh—melting, and juicy, with an agreeable sub-acid flavor, resembling the *Baronne de Melle*, but with more aroma. Class—good; will probably prove *very good.*

The *Beurre Clairgeau* has fruited in several gardens in the vicinity of Boston and New York, and promises to be a great acquisition. The tree is a strong, thrifty grower, either on the pear or quince root, and comes early into bearing, many trees which were grafted in the spring of 1851 being now full of fruit buds."

Mr. Cabot, President of the Massachusetts Horticultural Society, speaks of it as follows, in Hovey's Magazine of March last:

"So far as an opinion, formed by testing one or two specimens, and those from imported trees of the first year of bearing, is justifiable, this pear promises to be, on account of its size, beauty and quality, a highly valuable acquisition. It is a new pear, raised from seed by M. Clairgeau, at Nantes, of a yellow, russet color, with darker russet specks, and a little red in the sun; very large, with a short, very thick stem; calyx small and open; flesh yellowish white, tender, half melting, of a very pleasant sub-acid flavor, ripening last of October and November; tree a strong grower, wood stout, and appears to come early into bearing." The specimen from which our drawing is taken was grown by the editor.—*Horticulturist.*

PEARS ON QUINCE STOCKS.

We take the following from the Boston *Courier's* report of the proceedings of the late American Pomological Convention:

Mr. Barry of New York remarked that he had seen it stated in several newspaper paragraphs, that the cultivation of the pear on quince stocks had proved to be a failure. He regretted to have such statements sent abroad. They are not correct. He considered it a great blessing to the country that pears could be cultivated on quince stocks, because it enabled thousands upon thousands of our citizens to enjoy delicious varieties of fruit years earlier than they otherwise could. Perhaps the best way to check this erroneous impression would be for the Society to recommend a list of pears that succeed best on quince stocks. He had prepared a brief list of sorts and would submit it for the consideration of the meeting. All the pears enumerated were not, indeed, of the best quality, but they have been successfully proved on the quince. Before giving the list he would say that the best quince stocks were the Fontenay and another variety. The common apple or orange quince of this country is not a suitable stock for budding. It may grow well for one or two years, but will ultimately fail.

Pears for cultivation on quince stocks:—Rosliezer, Beurre d'Anjou, Beurre Diel, Duchess d'Angouleme, White Doyenne, Louise Bonne de Jersey, Fig d'Alencon, Unchaniste, Easter Beurre, Glout Morceau, Pound, Caltilac, Vicar of Winkefield, Napoleon, Beurre d'Amalis, Beurre d'Aremberg, Soldat Labourer, Beurre Langelcir, Long Green of Cox, Nouveau Poiteau, and St. Michael Archange. The list was adopted by the society.

Horticultural Advertisements.

FRUIT AND ORNAMENTAL TREES.

The subscribers are prepared for the fall trade with the largest stock of Fruit and Ornamental Trees ever before offered by one establishment in this country. It embraces

Standard and Dwarf Fruit Trees of the best varieties.

Strawberries, Gooseberries, Currants, and all the small fruits worthy of cultivation.

Hardy Grapes, for out-door culture.

Foreign Grapes, in pots, one and two years from the eye. More than 2,000 plants, of the best sorts.

Rhubarb, Asparagus, &c., in large quantities.

The Ornamental Department is equally extensive and complete, embracing

Hardy rapid-growing Trees for Avenues and Public Grounds.

Ornamental Standard and Weeping Trees, for Lawns, Cemeteries, &c.

Flowering Shrubs, for Lawns and Pleasure Grounds, in the greatest variety.

Hardy Evergreen Trees in immense quantities, embracing Norway Spruce, Balsam Fir, Austrian, Scotch, and Weymouth or White Pines, of all sizes.

Rare Evergreens, such as Deodars, Cryptomerias, Himalayan Spruce, &c.

Evergreen Hedge Plants, such as Arbor Vitæ, Red Cedar, &c., for ornamental inclosures in Gardens and Cemeteries.

Evergreen Shrubs, for Lawns, &c., such as Mahonias, Rhododendrons, Tree Box, &c.

Climbing Shrubs, for trellises and verandas. The finest Honeysuckles, Clematis, Trumpet Creepers, Wistarias, &c.

Roses—A large collection of the best varieties in cultivation.

Complete assortments of the best new *Phloxes, Chrysanthemums, Paonies, Dahlias, Carnations* and *Picotees,* and other hardy border plants.

Bulbous Flower Roots, embracing the finest Hyacinths, Tulips, Crocus, Narcissus, Lilies, &c., imported annually from Holland, and forwarded from the 1st of September.

Green-house Plants—All the popular articles, the newest and best Verbenas, Heliotropes, Fuchsias, &c., &c.

Trees are taken up in the most careful manner, and packages for distant points put up in the best style.

All orders will receive prompt and careful attention.—The trade supplied, as heretofore, on liberal terms.

The following Catalogues will be forwarded *gratis* and *pre-paid* to all who apply post-paid and enclose one stamp for each:

No. 1, A descriptive Catalogue of Fruits.

No. 2, A descriptive Catalogue of Ornamental Trees, Shrubs, Roses, &c.

No. 3, A descriptive Catalogue of Dahlias, Bedding-out and Green-house Plants.

No. 4, A wholesale Catalogue for Nurserymen and Dealers.

No. 5, A Supplemental Catalogue of Fruits, containing prices of Fruit Trees for 1854 and '55, with lists of new sorts, &c. ELLWANGER & BARRY,

Mount Hope Nurseries, Rochester, N. Y.

September, 1854. 247-21

FRUIT TREES,

Ornamental Trees, Shrubs, Flowering Plants &c.

An extensive and select collection of Fruit Trees, propagated from *bearing trees of the finest sorts,* is offered for sale at the Nursery of J. J. THOMAS, at the following prices:

Apple Trees,		20 cents each	$16 pr. 100	
Peach "		20 "	15 "	
Cherry "	with fine heads	37½ "	25 "	
Pear "	standards,	50 "		
Pear "	dwarfs,	37½ "	25 "	
Plum "	(large and thrifty)	50 "		

Besides the smaller fruits, as Strawberries, Grapes, &c.

☞ Careful selections will be made by the proprietor, when desired, embracing a suitable proportion of the best varieties, so as to afford a regular succession of the finest fruit through summer, autumn, and winter, without additional charge.

Also, for sale, a large collection of *Ornamental Trees* and *Shrubs, Herbaceous Perennial Flowering Plants, &c., &c.,* among which are the most brilliant varieties of Roses, the finest Spireas, Pæonias, Phloxes, &c.

Orders directed "J. J. THOMAS, Macedon, Wayne Co., N. Y.," accompanied with remittances, will be faithfully and promptly attended to, and the trees and plants packed in the best manner for safe conveyance by railway.

9th month, 1854. 247-2t*

NEWARK NURSERY.

WRIGHT & CO., Newark, Wayne Co., N. Y.

Fruit and Ornamental Trees of large or small growth, wholesale or retail. 50,000 Cherry Seedlings, also, 25,000 Peach in bud, and several thousand Mountain Ash, saleable single, &c., &c. WRIGHT & CO.

Newark, Wayne Co., N. Y., Sept., 1854. 247-2t*

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending Sept. 12, 1854.

Leander W. Boynton, of South Coventry, Conn., improvement in machines for cleaning wool.

Hezekiah C. Pridgham, New London, Conn., and James M. Stewart, Norwich, Conn., apparatus for turning the leaves of books.

Danl. Carpenter, Brooklyn, N. Y., improvement in surface condensers for marine engines.

Nath'l Colver, Detroit, Mich., improvement in boots and shoes.

Jno. B. Cornell, New York, improvement in metalic slat shutters.

Wm. Craig, New York, improvement in oscillating engines.

Perry Dickinson, Woodcock Township, Pa., improvement in mill stone dress.

Jos. Gatley, Rome, N. Y., improved piston or valve for rotary pumps, &c.

Warren Gale, Troy, improvement in straw cutters.

Abram J. Gibson, Clinton, Mass., improvement in coupling for carriages.

John L. Maxwell, Baltimore, Md., improvement in ventilating ship timbers.

Seymour N. Marsh, N. Y., improvement in trusses.

John W. Middleton, Philadelphia, improved method of applying heat to dilate gases, for the purpose of elevating water.

Gilbert Maynard, Greenfield, Mass., improvement in corn shellers.

James McGregor, Jr., N. Y., improvement in cooking stoves and ranges.

Andrew Mayer, Philadelphia, improved regulator for gas burners.

John W. Middleton, Philadelphia, improved apparatus for distributing fluids.

Ephraim Morris, South Bergen, N. J., improvement in apparatus for determining the weight of cargoes in vessels.

Newell North, Stow, Ohio, improved spoke-machine.

Wm. E. Osborn, Milton, N. Y., improvement in breech-loading cannon.

Jos. Phares, Cincinnati, improvement in tailors' shears.

Philander Shaw, Abington, Mass., improvement in sewing machines.

Samuel Shelden, Cincinnati, Ohio, improvement in portable grist mills.

Lorenzo Simonds, Boston, improvement in palate for artificial teeth.

Don Carlos Smart, Cambridgeport, Mass., improvement in curtain fixtures.

Franklin G. Smith, Columbia, Tenn., mode of operating fire engines.

RE-ISSUE.

Wm. Ball, Chicopee, Mass., rotary pump.—Patented December 23, 1851.

WELLMAN'S SELF-STRIPPING TOP-CARDS.

An improvement of no inconsiderable importance, considered by many second to none which have appeared since Arkwright's invention of the rotary cylinder, has been lately introduced in the carding department of the cotton manufacture by Mr. George Wellman, of Lowell. Mr. W. appears to have accomplished what several others have repeatedly attempted; he has attached to the top cards of an ordinary carding machine an automatic stripper, which carefully lifts each card from its place, strips it by a movement closely resembling that of the hand stripper, but much more gentle, equable and effective, and returns it to its place, accomplishing the work with any necessary degree of rapidity and at a considerably less expense for cards than in the present destructive method.

Mr. Wellman's invention dispenses with a great part if not the whole of the gang of strippers heretofore indispensable, and the expense of stripping is reduced to that of a much less frequent stripping even of the cylinder. It has been adjudged desirable to make the carding machine larger than usual in cases where this invention is to be applied, not from any necessity, but as a matter of economy, the attachment, which by the way may be applied to any cards now in use, costing no more for a large than a small card, and the presence of large cards adding considerably to the amount of work done on a given area of floor.

Mr. W.'s machine has been set in practical operation but in one case; a single machine in the works of the Merrimack Company, Lowell, where it has succeeded so completely during a trial of a little more than eleven months, as to secure the favor of cotton manufacturers from all portions of the country. The Merrimack Company have now in course of construction three more machines from the same pattern, the expense of repairs being found to be, in consequence of the slow motions and the equal distribution of the wear, much less than was anticipated. The number and variety of the motions in this device is said to exceed even that of the famous card-sticking machine, the operations of which have been several times exhibited in the mechanical department of the various fairs in our principal cities. This complexity of the mechanism has been endured rather than to involve the immediate *working* parts in any motions except those absolutely necessary. Several devices have been patented by other parties at various times for stripping top-cards by automatic apparatus, but they have failed chiefly in this point, viz: that the motions to which the cards were subjected were found to render almost utterly impracticable the delicate adjustment which is necessary in this species of mechanism.

Wellman's machine lifts, strips and replaces the cards with a motion very closely resembling that of the hand, and having originated with a thorough practical carder who has given this machine his enthusiastic attention for several years, it may safely be judged worthy of the immediate attention of all interested in the rapidity and cheapness of the cotton manufacture. Patents have been secured in this country and Great Britain.

Nothing begets confidence sooner than punctuality. Nothing so well becomes true feminine beauty as simplicity.

NEW PROCESS OF TANNING.

Roswell Enos, of Woodstock, Ill., has invented a new process of tanning sole leather, which he claims is more expeditious and economical than the usual method. He uses two sorts of tanning liquor, prepared with sumac, and salt, and hemlock or oak, mixed in various proportions. The first liquor, it is claimed, prepares the hide to receive the tan rapidly, and so changes the nature of the gelatine of the hide, that after it has remained three or four days in the liquor it will not become hard when dried. It also so opens the pores of the hide that the strongest liquors can be applied without in any way injuring or binding it. It has been found that more tan can thus be taken up or applied to the hide in six days than is generally taken up or applied in six weeks by the old method. The sole-leather made by this process, of Sweat Buenos Ayres hides, will make sewed-work equally as well as the lined slaughter hides. The leather is also tough and strong. The length of time required for tanning a dry Buenos Ayres hide is ninety days, with seventy-five per cent. gain. The time required for tanning an Oronoco hide is much less, with a gain of eighty or eighty-five per cent. This method will tan slaughter sole-leather in thirty days; harness or upper leather in the rough in twenty days, and calf-skins in from six to twelve days.—How far these pretensions are true we have no means of judging from our own knowledge, but we have seen specimens of leather made by the process which had every appearance of excellence. If experience shall prove the invention to be a good one, it will be a great benefit to all who wear shoes, or otherwise use leather.—*New York Tribune.*

Glass Bricks.—Among the more recent inventions patented by manufacturers, we hear of one by Mr. Summerfield, of the glass-works, Birmingham Heath, England, for what are termed chromatic glass, or glass-faced grooved bricks. By Mr. Summerfield's process, red or other clay can be combined with glass, and this will secure durability, entire resistance to moisture, and give an ornamental appearance to the building. The form of the brick is also, by means of a groove at the side and end, made so as to add greatly to the strength of the erection, the joints by this means being brought close together, and the mortar acts as a dowel from the shape of the groove.—*London Builder.*

Light in Dyeing.—An English artisan proposes to employ the chemical agency of light in dyeing or staining textile fabrics; the cloth, whether wool, silk, flax, or cotton, being first steeped in a suitable solution, then dried in the dark, and subsequently exposed to the action of light, those parts which are to form the pattern being protected by pieces of darkened paper, or some other suitable material, fastened to a piece of glass. When the desired effect is produced, the time for which varies from two to twenty minutes, the fabric has to be removed, in order to undergo a fixing operation, while a fresh portion of it is exposed to light.

John M. Weare, of Seabrook, New Hampshire, has recently obtained a patent for holding cows' tails during the operation of milking. The machine is fastened to one of the animal's hind-strings, and the tail is compressed. Mr. Weare politely styles his discovery the "Milker's Protector." Cows, says the Washington Union, in a fit of humor, will probably live forever, as this patent machine is designed to prevent them from "kicking the bucket."

Domestic Economy.

To Keep Worms from Dried Fruit.—Place your fruit in a steamer, over a pot of boiling water, covered tightly. When thoroughly heated, tie them up immediately in a clean cotton or linen bag, and hang them up. This method is preferable to heating in an oven, as that is apt to render them hard, even if you are so fortunate as to not burn them.

Tomato Pie.—After you have lined your plate with paste, spread thereon a layer of sliced green tomatoes, add a tea-cupful of molasses, two small table-spoonfuls of flour, a little salt and nutmegs. Cover with paste, and bake slowly, and it will make an excellent pie.

Cream Cake.—One cup sour cream, one of sugar, two of flour, and two eggs, and two tea-spoonfuls saleratus.

Cup Cake.—One cup of butter, two of sugar, three of flour, four eggs, one cup sour milk, one tea-spoonful saleratus. Bake in small dishes.—*American Agriculturist.*

Summer Snowballs.—At a time when flour is so dear, many are glad to meet with a contrivance by which some cheaper substitute may be agreeably used, and such the following will be found:—Simmer half a pound of rice until it is tender, then strain it. Take five or six apples, of middling size, pare them and take out the core with a small knife or apple scoop, but do not cut them into sections. Into the hollow made by cutting out the core, put sugar and a little allspice. Divide the rice into a portion for each apple, and with the hand lay each portion equally over an apple, and tie them separately in a small cloth, and boil an hour. These dumplings or snowballs may be served with sweet sauce; or eaten with simple sugar treacle.

Tomatoes like Cucumbers.—Take fair fruit; the kind called love-apples is the best; remove the skins and slice them. Sprinkle a little salt upon them, pour vinegar over them, (rather less than for cucumbers,) and put on pepper.

Educational.

ERRORS OF TEACHERS.

Teachers, like all other mortals are fallible beings, liable with the best intentions to make mistakes, to misjudge, and to err. It is as unreasonable to hold a teacher to an absolute test of perfection, as it is to hold any other human being accountable by the same test.—Look where we will throughout the varied scenes of life, and among the complicity of human employments, and we shall find as many differences of opinion almost as there are men. From one set of circumstances and facts there can be but one conclusion absolutely correct upon any one point, and consequently all others must be in some sense wrong.

Even the soundest and most mature minds quite frequently disagree upon a plain statement of facts, and draw diverse conclusions from the same identical premises. This position is ably illustrated in our courts of justice, where the ruling of a judge will sometimes be alternately reversed and affirmed, through the various tribunals up the Court of Last Resort, and even there, although the opinion of the majority of the Judges stands as law, and is considered correct so far as a legal precedent is concerned, yet quite a respectable minority frequently stand opposed to the judgment of the court. The only assurance that the decree is the correct one at last is the fact that no higher tribunal exists to which an appeal can be carried. How frequently does it occur in our own Court of Appeals, in the Supreme Court of the United States, and in the British House of Lords, that some of the ablest judges on the bench dissent from the majority of their learned brethren.

On every question of political faith, on every point of religious doctrine, on every principle of social life, an every ground of moral accountability, there are differences of opinion error, and sophistry. In every position in which a human and accountable being can be placed, diverse views will be entertained.—Why then should a teacher be held to so stern account, and his errors be visited upon his head without stint or mercy? He is quite as likely to err conscientiously as other men, and perhaps much more so than those engaged in other intellectual pursuits, from the fact of his being in a majority of cases more youthful and inexperienced. It is generally the first employment he assumes above that of an artisan, and is the first stepping stone to other, more lucrative, and more honorable employments in the world's esteem. If we look the country through, it is no unsafe venture to say that three-fourths of our divines, Judges, and statesmen, literary men, editors, physicians, and lawyers, have been teachers at some period of their lives. Those who have not been such are exceptions to a general rule, and have missed one of the best means of discipline to which the human mind can be subjected.

The teacher should feel the due weight of his responsibility, and if he err, let the error be unavoidable. Let not carelessness, inattention, or inconsiderateness be the basis of his wrong judgment, for the immortal mind is the subject on which he works and the error which he commits will be eternal in its results. The mechanic, if he spoil the subject of his labor, can throw it aside and take another with the loss of only his time and the materials; while that on which the teacher acts, if once ruined will be irremediable and result in the wreck of a human soul. Its value cannot be estimated nearer than by the solemn question of our Saviour, "What shall it profit a man though he gain the whole world and lose his own soul, or what shall he give in exchange for his soul?" While the errors of the teacher should be judged of by others in the same light and by the same standards as those of other men, he should be a stern censor of his own conduct and motives, giving no quarter to hasty impulses, impure thoughts, crude and ill-digested opinions, and erroneous action.

"A Rolling Stone Gathers no Moss."—Well, what of that? Who wants to be a mossy old stone, away in some damp corner of a pasture where sunshine and fresh air never come, for the cows to rub themselves against, for snails and bugs to crawl over, and for toads to squat under among the poisonous weeds?—It is far better to be a smooth and polished stone, rolling along in the brawling stream of life, wearing off the rough corners, bringing out the firm crystalline structure of the granite or the delicate veins of the agate or chalcedony. It is this perpetual chafing and rubbing in the whirling current that shows what sort of grit a man is made of and what use he is good for. The sandstone and soapstone are ground down to sand and mud, but the firm rock is selected for the towering fortress, and the diamond is cut and polished for the monarch's crown.

There are many people who falter and tremble as long as there is any mixture of doubt in their minds as to what they can, or what they ought to do, but who, the moment that doubt ceases, have power and will to dare everything.

SPELLING-SCHOOLS.

The school in the "Quaker neighborhood" have sent a challenge, in due form, to this district, to spell; so, to night "the war of words" is to be waged in the white school-house on the hill.

There is a great overhauling of old "Elementaries," and a wonderful furbishing up of frontispieces, and turning over of clean collars, preparatory to the grand melee.

Spelling-schools! Have you forgotten them? When, from all the region round about, they gathered into the old log school-house, with its huge fireplace, that yawned like the main entrance to Avernus. How the sleigh-bells—the old-fashioned bells, big in the middle of the string, and growing "small by degrees and beautifully less" toward the broad brass buckle—chimed, in every direction, long before night, the gathering of the clans.

There came one school, "the Master—give him a capital M, for he is entitled to it—Master and all, bundled into one huge, red, double sleigh, strown with abundance of straw, and tucked up like a Christmas pie, with a half-score of buffalo robes. There half a dozen "cutters," each with its young man and maiden, those two and no more.

And there, again, a pair of jumpers, mounting a great, outlandish looking bin, heaped up, pressed down, and running over, with small collections of humanity, picked up en route, from a great many homes, and all as merry as Kittens in a basket of wool. And the bright eyes, and ripe, red lips, that one caught a glimpse of, beneath those pink-lined quilted hoods, and the silvery laughs that escaped from the woolen mufflers and fur tippets they wore then—who does not remember? who can ever forget them?

The school-house destined to be the arena for the conflict, has been swept and garnished; boughs of evergreen adorn the smoke-stained and battered walls. The little pellets of chewed paper have been all swept down from the ceiling, and two pails of water have been brought from the spring, and set on the bench in the entry, with the immemorial tin cup—a wise provision indeed, for warm work is that spelling!

The "big boys" have fanned and replenished the fire, till the old chimney fairly jars with the roaring flames, and the sparks fly out of the top like a furnace.

The two "Masters" are there; the two schools are there; and such a hum, and such a buzzing to and fro! The oaken ferule comes down upon the desk with emphasis. What the roll of the drum is to armies, that, the "ruler" is to this laughing, whispering, young troop. The challenged are ranged on one side of the house; the challengers on the other. Back seats, middle seats, low, front seats, all filled. Some of the fathers and grandfathers, who could, no doubt upon occasion,

"Shoulder the crutch, and show how fields were won,"

occupy the benches of honor near the desk.

Now for the preliminaries: the reputed best speller on each side "chooses." "Susan Brown!" Out comes a round-eyed little penny. Who would have thought it! Such a little thing, and chosen first.

"Moses Jones!" Out comes Moses, an awkward fellow, with a shock of red hair, shockingly barreled, surmounting his broad brow. The girls laugh at him, but what he does'n't know in the "Elementary" isn't worth knowing.

"June Murray!" Out trips June, fluttered as a bride, and takes her place next to the caller. And so they go on, "calling names" until five or six champions stand forth to do battle, and the contest is fairly begun. Down goes one after another, as words of three syllables are followed by those of four, and these again by words of similar pronunciation and divers significations, until only Moses and Susan remain.

"The spelling-book has been exhausted, yet there they stand. Dictionaries are turned over—memories are ransacked for

"Words of learned length and thundering sound,"

until, by and by, Moses comes down like a tree, and Susan flutters there still, like a little leaf aloft, that the frost and the fall have forgotten

Polysyllable follows polysyllable, and by and by Susan hesitates just a breath or two, and twenty tongues are working their way through the labyrinth of letters in a twinkling. Little Susan sinks into the chink left for her on the crowded seat, and there is a lull in the battle.

Then, they all stand in solid phalanx, by schools, and the struggle is to spell each other down. And down they go, like leaves in winter weather, and the victory is declared for our District, and the school is "dismissed."

Then comes the hurrying and bundling, the whispering and glancing, the pairing off and the tumbling-in. There are hearts that flutter and hearts that ache; "mittens" that are not worn, secret hopes that are not realized, and fond looks that are not returned. There is a jingling among the bells at the door; one after another the sleighs dash up, receive their nestling freight and are gone.

Our Master covers the fire, and snuffs out the candles—don't you remember how daintily he used to pinch the smoking wicks, with forefinger and thumb, and then thrust each lifeless luminary, head first, into the tin socket?—and we wait for him.

The bells ring faintly in the woods, over the hill, in the valley. They are gone. The school-house is dark and tenantless, and we are alone with the night."—*June und Junuary.*

Keep your Sons Employed.—Let play be but their occasional privilege, and they will enjoy it far more highly. Employ them in the garden, if you have one, as work is not play. Give them daily and regular duties about the house. It will do them no harm to perform humble services. It will help you and help them still more to have them bring wood or coal, to scour the knives, to make their own beds, to keep their rooms in order.

A word of kindness is a seed which, even when dropped by chance, is sure to spring up a flower.

Useful Olio.

THE BLUE SKY.

BY A. J. ENSIGN.

There is in the blue sky above us a beauty and richness of scenery for all. It affords a delightful enjoyment alike to the rich and poor. Here may the poor man find his heritage of genuine beauties far surpassing all that human genius can design or all execute. Here is placed for him the embodiment of ideal excellence. Where can be found, even in the works of the old masters, colors so brilliant and so rare as we see variegating the surface of the sky? And yet how unmindful we usually are of all this glorious scenery, starting up as if by magic at the touch of Creative Wisdom, for our improvement and our pleasure. It is of such glowing pictures as are sketched on the blue arch, fringed with light and golden clouds, such magical forms as the floating mist capriciously and constantly is assuming, marked by a peculiar grace and sweetness, that nature talks to us, teaches us lessons truer than art, cultivates and refines our tastes.

Angelo and Raphael, Van Dyke and Rubens, unrivalled artists of the Italian and Flemish schools of painting, conceive and execute works of imperishable beauty, which will ever be memorials of rare genius and high culture. Though they could seize the varied beauty of the landscape and with soft colors almost make the rainbow-tints gild the canvas, the living beauty so changing and yet so fair, the azure hue of the sky with all its deepness, the golden rays of the sun so rich and so full of life, none but the hand of the Divine Artist could form. They could copy the fantastic forms of the clouds and fringe them with dyes of gorgeous beauty; but they could not give them motion, not even a shade of that element which makes them as a thing of life. This living principle no artist can give to the creations of his own mind, or his copies from nature. And it is to this continual change, clouds assuming all forms, fringed with varied hues, this intermingling of clear and cloudy sky, that we are indebted for much of the pleasure derived from the contemplation of the open heavens.

Here, then, may the peasant equally with the prince admire designs of a workmanship surpassing all that ancient or modern galleries of art can boast. But, though we are incapable of transferring the beauties of the sky, of the cloud and sunshine to the canvas, we may yet be able to analyze their properties and understand the principles on which they are formed. Nor should any of the objects or phenomena of nature diminish in interest from being capable of a strictly scientific explanation. It should rather awaken us to the universal truth that nature from the simplest and crudest materials forms the grandest and most wonderful objects.

The atmosphere which surrounds the earth on all sides, is an elastic fluid. Though a fluid, it is so subtle and transparent as to be incapable of detection by the eye. From its elastic nature it permeates and fills all bodies. Our knowledge of it is obtained partly from experiment and partly from observation. By experiment we ascertain its chemical properties, that it is essentially composed of oxygen and nitrogen, and that these are necessary to animal life. By observation upon large masses we know that it is transparent,—that though comparatively dense on the surface of the earth, it becomes extremely rarified in the higher regions—that heat expands and contracts it, thus causing many wonderful and beautiful appearances in nature. Many of the natural phenomena which rarely and frequently occur, occasioning astonishment and admiration, find their true solution in a careful observation of the atmosphere and its peculiar properties.—To this same cause may be referred the beautiful azure appearance of the heavens.

The atmosphere is composed of an infinite number of small opaque particles. These particles which obstruct the rays of light are illuminated by them, and afterwards retransmit their own proper rays, produced in their surface by a violent agitation, as is the case in all opaque bodies. Now, it is the number of vibrations communicated to them which represents to us this magnificent azure. These particles are extremely minute and considerably distant from each other; they are also delicately fine and almost wholly transparent,—Hence, each separately is imperceptible, so that we can be affected by them only when a very great number transmit their rays at once to the eye and nearly in the same direction. The rays of several of these particles must, therefore, be collected, in order to excite a sensation. It clearly follows that such of these particles as are near to us escape our senses; for they must be considered as points dispersed through the mass of air. But such as are very remote uniting with others nearer collect in the eye almost according to the same direction. The azure color which we see in the heavens when serene, is nothing else, then, but the result of all these particles dispersed through the atmosphere, especially of such as are very remote.

It may be affirmed, therefore, that the particles of air are in their nature blue, but a blue extremely clear, which does not become sufficiently deep and perceptible, except they are in great number and unite their rays according to the same direction. That this color is owing to the bluish rest of the particles of the air, yet in each one so very faint as to be imperceptible till presented in a large mass, as the whole extent of the atmosphere, rather than that this color is to be ascribed to exhalations and vapors floating in the air, but which do not appertain to it, will be apparent from a simple consideration. It is a well known fact that the purer the air, and the more free it is from exhalations, the brighter is the lustre of heaven's azure: a conclusive proof that the reason of it lies in the essential particles of the air. Substances mingling with the air, but which do not enter into its formation, are injurious to that deep ethereal blue, and render its lustre less brilliant.

North Bridgeway, 1854.

BRAIN AND THOUGHT.

Richmond mentions the case of a woman whose brain was exposed in consequence of the removal of a considerable portion of its bony covering by disease. He says he repeatedly made pressure on the brain, and each time suspended all feelings and all intellect, which were instantly restored when the pressure was withdrawn. The same writer also relates another case, that of a man who had been trepanned, and who perceived his intellectual faculties failing; and his existence drawing to a close, every time the effused blood collected upon the brain.

Professor Chapman, of Philadelphia, mentions in his lectures, that he saw an individual with his skull perforated, and the brain exposed, who was accustomed to submit himself to the same experiment of pressure as the above, and who was exhibited by the late Professor Webster to his class. His intellectual and moral faculties disappeared on the application of pressure to the brain; they were held under the thumb, as it were, and restored at pleasure to their full activity by discontinuing the pressure. But the most extraordinary case of this kind within my knowledge, and one peculiarly interesting to the physiologist and metaphysician, is related by Sir Astley Cooper in his surgical lectures:

A man by the name of Jones, received an injury on his head while on board a vessel in the Mediterranean, which rendered him insensible. The vessel soon after this made Gibraltar, where Jones was placed in the Hospital, and remained several months in the same insensible state. He was then carried on board the Dolphin frigate to Deptford, and from thence was sent to St. Thomas's Hospital, London. He lay constantly upon his back, and breathed with difficulty. His pulse was regular, and each time it beat he moved his fingers. When hungry and thirsty, he moved his lips and tongue. Mr. Clyne, the surgeon, found a portion of the skull depressed, trepanned him, and removed the depressed portion. Immediately after this operation the motion of the fingers ceased, and at four o'clock in the afternoon, the operation having been performed at one, he sat up in bed; sensation and volition returned; and in four days he got out of bed and conversed. The last thing he remembered was the circumstance of taking a prize in the Mediterranean. From the moment of the accident, thirteen months and a few days, oblivion had come over him, and all recollection ceased. He had for more than one year, drank of the cup of Lethe, and lived a bodily existence of existence, yet upon removing a small portion of bone which pressed upon the brain, he was restored to the full possession of the powers of his mind and body.—*Dr. Brigham.*

A CURIOSITY OF ART.

There is an exhibition in Paris at the present time in Rue-Neuve-des-pit-champs, (a long name for New Littlefield st.,) No. 5, one of the most remarkable pieces of modern work which the union of art and science has ever produced. It consists of a picture of about three feet square. This picture is made up of colors admirable for their beauty and boldness, but there is no subject. The most experienced eye can detect nothing but disjointed and half-formed approximations towards a coherent design. The most able artist sees there only the finest colors, but no one can tell what they are intended to represent. In the middle of the picture which is horizontally placed, is a mirror formed by a copper cylinder covered by a perfectly polished coating of silver. This mirror is usually veiled.

So far there is little remarkable, and the greatest amateurs in painting would hardly consent to spend five francs on such an apparently profitless study. But it is impossible not to feel a glow of admiration when, on uncovering the mirror, there is presented upon it in the brightest reflected rays, the whole scene of the Crucifixion. The partial coloring then takes a character of inconceivable superiority, and presents to the astonished spectators a picture composed of six most perfect figures, depicted with a degree of boldness such as the master painters alone knew how to impart to the subject which it was their glory to represent.

While Daniel Webster was Secretary of State, he was present at a ball when a fop said to him, "Don't you dance, Mr. Webster? I never see you dancing." "No," said he, "I never had the capacity to learn how, sir."

Sunday Reading.

[For the Rural New-Yorker.]

SABBATH MORNING IN SUMMER.

BY ANNA M. LANGELAND.

Rest in the fields, and Sabbath on the hills,
And in the deep blue sky rest gently lies,
And sheddeth on the world a dream of peace.
Each ray of light that floweth from the sun
Comes winging softly down to earth, unheard
The sweep of its transparent pinions, whose
Plumes fall downward where the shadows lie
A-wearing for themselves a wreath of light.
E'en thus amid the soul's dark shadows here
The Sabbath light of Heaven sheds through the night,
And wreathes around the soul the blessed light
Of Immortality. We feel and know
When gleams upon the world a morn of such
Transcendent loveliness, that He who spake
The world to life, still lets his shadow fall
On earth; and the faint spirit longs to bask
In the eternal Sabbath light unveiled.

There sleeps upon the world a spell of peace
Too deep and holy for this fleeting scene;
The golden billows of the ripened grain,
That yesterday were wantonling up the hill
Have lulled themselves to rest, and now, each head
Binds with the blissful burden of its peace;
Each bending bough seems laden with a dream,
So motionless they sleep against the sky.
While from the grave-yard's marble monuments
There breathes a double spell of joy and rest;
The wearied form whose Sabbath has begun,
To end no more in the vast range of Time,
Sleeps softly as a sea flower lulled asleep
Upon the singing wave's soft swelling breast.
And the freed spirit that was seeking here
Vainly for some fair isle of peaceful rest,
Upon Time's dark and everchanging sea,
Hath launched at last upon Death's mystic tide,
And crossed the shadowy realm we all draw near;
And now its bark glides o'er the crystal wave,
Where float "pure lilies of eternal peace."

A voice of prayer is on the breathing air,
And each form rises now upliting to the morn,
Seems like a silk-leaved volume full of prayer;
While from each floral bell soft melting sighing,
Their rich deep gush of fragrance to the morn
Breathes ever on the soul "a call to prayer;
While from each gold and azure cup, that pours
Its flood of beauty in the light, a cloud
Of incense floateth up; the silvery pearls
Of dew he all unstrung and o'er the fields,
As if some angel's wing had dropped them down
To fling o'er earth a robe of diamond gems,
To mark for their holy Sabbath day.
Thus may the robe of righteousness enweave
My soul ere she shall soar to meet th' eternal real.

BEAUTIFUL APOSTROPHE TO THE BIBLE.

We would be pleased to know the author of the following most eloquent apostrophe to the Bible. It appears to have been addressed to the young men. We have seldom read anything finer:

"Study now to be wise; and in your getings get understanding. And especially we'd charge upon your heart-bound, soul-wrapped attention, that Book upon which all feelings are concentrated, all opinions which enlighten the judgment while it enlists the sentiments, and nourishes the imagination in songs upon the harp of the 'sweet singster of Israel.'—That Book which gives you a faithful insight into your heart and consecrates its character in

"Shiloes
Such as the keen tooth of time cannot touch."

Would you know the effect of that book upon the heart? It purifies the heart and sanctifies its joys; it nerves and strengthens it for sorrows and mishaps of life, and when those shall have ended, and the twilight of death is spreading its dew damp upon the wasting features, it breaks upon the last glad throb, the bright and streaming light of Eternity's morning. Oh! have you ever stood beside the couch of a dying saint, when

"Without a sigh,
A change of feature or a shaded smile,
He gave his hand to the stern messenger,
And as a glad child seeks his father's arms,
Went home."

Then you may have seen the concentrated influences of this Book. Would you know its name? It is the Book of Books—its author, God—its theme, Heaven, Eternity. The Bible! Read it—search it. Let it be the first upon the shelves of your library, first in the affections of your heart. Search the Scriptures, for in them ye think ye have eternal life, and they are they which testify of me.—Oh! if there be sublimity in the contemplation of God—if there be anything ennobling and purifying in the revelation of man's salvation—search the Scriptures, for they are they which testify of these things."

NOT TIME ENOUGH.

Not time enough? So the gilt edges of the Bible remain unburnished, and it leaves its own profile of dust on the table. Not time enough to study its teachings. But there is time enough for other things.

Time enough to coil around the soul the web of wealth, which, when completed, forms its shroud.

Time enough to simmer away afternoon after afternoon in the maudlin sympathy of romantic sentimentalism, until the heart, in its voluptuous impotence, becomes incapable of real love to God or man!

Time enough to lay plot upon plot and scheme upon scheme, for the gratification of ambition or vanity!

Time enough to be sick, though then, when the heart is troubled, and the body faint, and the head sluggish, there is indeed not time enough to repent!

Time Enough to Die!—*Episcopal Recorder.*

Take the hand of the friendless. Smile on the sad and dejected. Sympathize with those in trouble. Strive everywhere to cause around you sunshine and joy. If you do this you will surely be beloved.

Miscellaneous.

EARLY TO BED, AND EARLY TO RISE.

BY ELIZA COOK.

"Early to bed, and early to rise"—
Aye, note it down in your brain,
For it helpeth to make the foolish wise,
And uproots the weeds of pain.
Ye who are walking on thorns of care,
Who sigh for a softer bower,
Try what can be done in the morning air,
And make use of the early hour.

Full many a day forever is lost,
By delaying its work till to-morrow;
The minutes of sloth have often cost
Long years of loveless sorrow.
And ye who would win the lasting wealth
Of content and peaceful power,
Ye who would couple Labor and Health,
Must laugh at the early hour.

We make bold promises to Time,
Yet, alas! too often break them;
We mock at the pledge of the King of kings,
And think we can overtake them.
But why loiter near the pillow of the day,
Knowing that clouds may lower?
Is it not safer to make Life's way
In the beam of the early hour?

Nature herself ever shows her best
Of gems to the gaze of the lark,
When the sparkles of light on the earth's green breast
Put out the stars of the dark.
If we love the purest pearl of the dew,
And the rich breath of the flower,
If our spirits would greet the fresh and the sweet,
Go forth in the early hour.

Oh, pleasure and rest are more easily found
When we greet through Morning's gate,
To ram up our figures, or plow up our ground,
And weave not the threads of fate.
The eye looketh bright, and the heart keepeth light,
And man boldeth the conqueror's power,
When, ready and brave, he chains Time as his slave,
By the help of the early hour.

MARRIED BY GAS-LIGHT.

"I have been to a wedding this afternoon," remarked a friend. "Oh, it was a splendid affair! the bride was gloriously attired, and appeared so magnificent in the gas-light"——

"In the gas-light! I thought you said you went to the wedding *this afternoon* — this bright, sunny and cloudless day; and now you say, 'the bride appeared so magnificent in the gas-light?'"

"Yes, in the gas-light; the shutters were all closed, and the shades down. The wedding party assembled in the elegantly-furnished parlors all lighted by gas and I tell you it was a spectacle worth seeing. It's the fashion in New York to be married by gas-light, and why should it not be the fashion here? The only drawback to enjoyment was the intensity of the heat; not a breath of air was stirring in the room, and the gas-burners would give out heat as well as light. It is fashionable to have the gas-light, and, of course, as light and heat are inseparably, it is fashionable *ex necessitate rei*, to have the heat also. Let rude and clownish countrymen perform the sacred and solemn nuptial ceremony, by the vulgar light of the sun! let their weddings be in the rude and simple church dedicated to the service of the Most High; or, what is still more plebian, let the vow be uttered under the broad canopy of the deep-blue sky; we can do better, and have our weddings in splendidly-furnished parlors, shut up from the rude gaze of the outside multitude, and too exclusive even for the presence of the god of day. It is a much more brilliant and recherche way of doing the thing, and *it hides any defects of dress, complexion or person on the part of the bride.* Besides, anybody can be married by sun-light; but it is only upper-tendom that can afford elegant parlors all lit up by gas."

Seriously, this new-fashioned way of closing parlors in the day-time for the sake of performing a wedding ceremony by artificial lights, is, to say the least of it, a *gaseous* affair. It is degrading one of the most solemn and sacred ceremonies instituted by the Deity for the well-being of the human race, into a theatrical show. It is transforming men and women about to assume responsibilities before high heaven that ought, if they do not, to inspire them with reverential thoughts and serious reflections, into buffoons and actors on a stage! It tends to nourish false pretensions and snobbishness, and engenders feelings of superiority above the mass of men, based on adventitious circumstances, and consequently false. All men, even in cities, do not have gas in their houses, and consequently all cannot be married by gas-light; but, thank God! that deficiency does not interdict the ceremony in the first instance, nor give cause for a divorce *a vinculo matrimonii* afterwards!

Marrying by gas-light may be the fashion in the gay salons of Paris, and servile imitators in New York may do the like; but that is no endorsement of its taste or propriety, any more than gigantic failures, forgeries, issuing fraudulent stock to the amount of millions, and thereby cheating honest holders out of their means, sanction the fraud. The money thus acquired may furnish costly saloons and the gas whereby the lawn-sleeved priest may see to read a marriage ceremony in the daytime, independent of any obligation to the sun; but the lie will be not a whit more surredly observed, nor any more likely to result felicitously, than if Apollo lit the nuptial torch with his flaming wheel.

THE SUCCESSFUL BARRISTER.

According to the Paris correspondent of the Atlas, a young English barrister had succeeded in marrying Mdlle. R——, the wealthiest heiress in Paris, and connected with one of the highest families. The young lady was known to possess an unfashioned weakness for a well-dressed man, and by loudly expressing this opinion, had been of more service to the tailors of Paris within the last year than Count d'Orsay in double the space of time. The barrister had many rivals, but the most formidable was a gentleman acknowledged to be the most approved dandy in Paris. The lady selected these two to decide from, and invited them both to her chateau. The Frenchman declared to his friends that he meant to cut the matter short at once, by so outshining the Englishman by his dress, that the latter would retire from the field, crushed in atoms by the superior skill he was determined to manifest on the occasion. The Englishman said nothing, made no boast, but accepted the invitation, and, together by the same train, the two rivals left Paris for the seat of war.

It so happened that the French dandy had furnished himself with a regular *trousseau* for the occasion at the great English tailor's, in the Rue du Helder, and the English tailor, out of sheer compatriotism, had told Mr. H—— of what it was composed. A sudden idea flashed across the brain of the barrister. His servant, one of the sanctified hypocritical *roue* rubrics for whom London was always famous, is something about the height and size of the French *petitmaitre*. Mr. H—— immediately ordered for this silly the exact counterpart of every suit already ordered by the Marquis de la R——! The first day, at dinner, the poor young marquis was rather disconcerted, when, upon entering the dining room, his glance alighted upon the very counterpart of himself, standing still and self-centred behind the Englishman's chair; and he looked angrily at his rival to see if any insult was intended, but the Englishman was too intent upon making himself agreeable to the lady to notice his ruffled temper. The second day the same scene was enacted, although our hero had completely changed even the style of his whole *tournure*; and again was the same ill-humor displayed during the whole dinner, while Mr. H—— was profiting by the silence of his witty rival. The third and fourth repetitions were too ridiculous. The young marquis, too clever, and too much the man of the world not to feel the absurdity of his position, prudently withdrew.

WHEN YOU SHOULD TAKE YOUR HAT.

Young man, a word. We want to tell you when you should take your hat and be off.—And mind what we offer. It is:

When you are asked to "take a drink."

When you find out that you are courting an extravagant or slovenly girl.

When you find yourself in doubtful company.

When you discover that your expenses run ahead of your income.

When you are abusing the confidence of your friends.

When you think that you are a great deal wiser than older and more experienced people than yourself.

When you feel like getting trusted for a suit of clothes, because you haven't the money to pay for them.

When you "wait upon" a lady just for the "fun of it."

When you don't perform your duty, your whole duty and nothing but your duty.

MEN OF AMERICA.

The greatest man, "take him all in all," of the last hundred years, was General George Washington—an American.

The greatest Doctor of Divinity was Jonathan Edwards—an American.

The greatest philosopher was Benjamin Franklin—an American.

The greatest of living sculptors is Hiram Powers—an American.

The greatest of living historians is Wm. H. Prescott—an American.

The greatest multilingist was John James Audubon—an American.

There has been no English writer of the present age, whose words have been marked with more humor, more refinement, or more grace, than those of Washington Irving—an American.

The greatest lexicographer since the time of Johnson, was Noah Webster—an American.

The inventors, whose works have been productive of the greatest amount of benefit to mankind in the last century, were Godfrey, Finch, Fulton and Whitney—all Americans.

GEMS OF THOUGHT.

It is only great souls that know how much glory there is in being good.

There are some that live without any design at all, and pass in the world like straws on a river; they do not go but are carried.

The footprint of the savage traced in the sand is sufficient to attest the presence of man to the atheist who will not recognise God, whose hand is impressed upon the universe.

Honor, like the shadow, follows those who flee from it, but flees from those who pursue it.

Honesty obliges us to make restitution, not only of that which comes to us by our own faults, but of that which comes to us by the mistake of others. Though we get it by oversight, if we keep it when the oversight is discovered, it is kept by deceit.

Nothing can excuse a want of charity to a fellow creature in distress. He is poor, perhaps, through his own folly or that of his ancestors; and we are rich, perhaps, through our own roguery or that of our ancestors.

After the "sting of folly" has made men wise, they find it hard to conceive that others can be as foolish as they have been.

FACTS ABOUT FRIDAY.

From time immemorial, Friday has been figured upon as a day of ill omen. And though this prejudice is less prevalent now than it has been of yore, when superstition had general sway, yet there are many, even in this matter-of-fact age of ours, who would hesitate, on a day so inauspicious, to begin an undertaking of momentous import. And how many brave mariners, whose hearts, unquailed, could meet the wildest fury of their native home, would blanch to even bend their sails on Friday. But to show with how much reason this feeling is indulged, let us examine the following important facts in connection with our own settlement and greatness as a nation, and we will see how little cause we Americans have to dread the fatal day.

On Friday, August 31, 1492, Christopher Columbus sailed on his great voyage of discovery.

On Friday, Oct. 12th, 1492, he first discovered land.

On Friday, Jan. 4th, 1493, he sailed on his return to Spain, which, if he had not reached in safety, the happy result would never have been known, which led to the settlement of this vast continent.

On Friday, March 15th, 1493, he arrived at Palos in safety.

On Friday, Nov. 22d, 1493, he arrived at Hispaniola on his second voyage to America.

On Friday, June 13th, 1494, he, though unknown to himself, discovered the continent of America.

On Friday, March 6th, 1496, Henry VII of England, gave to John Cabot his commission which led to the discovery of North America. This is the first American State paper in England.

On Friday, Sept. 7th, 1565, Melendez founded St. Augustine, the oldest settlement in the United States by more than forty years.

On Friday, Nov. 10th, 1620, the May Flower, with the Pilgrims, made the harbor of Provincetown. And on the same day they signed that august compact, the forerunner of our present glorious Constitution.

On Friday, Dec. 22d, 1620, the Pilgrims made their first landing at Plymouth Rock.

On Friday, Feb. 22d, George Washington, the Father of American Freedom, was born.

On Friday, June 6th, Bunker Hill was seized and fortified.

On Friday, Oct. 7th, 1777, the surrender of Saratoga was made, which had such power and influence in inducing France to declare for our cause.

On Friday, Sept. 22d, 1780, the treason of Arnold was laid bare, which saved us from destruction.

On Friday, Oct. 19th, 1781, the surrender at Yorktown, the crowning glory of the American arms, occurred.

On Friday, July 7th, 1796, the motion in Congress was made by John Adams, seconded by Richard Henry Lee, that the United Colonies were, and of right ought to be, free and independent.

Thus, by numerous examples, we see that, however it may be with other nations, Americans need never dread to begin on Friday any undertaking, however momentous it may be. —*Schoolmate.*

THE REAL RAILWAY KING.

The London Times makes the following remarks, on the erection in the Great Hall at Euston Square terminus, of a statue to George Stephenson:—"In early life a collier, working for his daily bread in the bowels of the earth, he mended watches in his leisure hours, that his son might have the blessings of education. While his time as a mechanical and civil engineer was still in its infancy, he elaborated experimentally the same result as to the safety lamp which Sir Humphrey Davy reached by the process of philosophic induction. The damps of the coal mines, and the rude forms of the first locomotive engines grew under the strokes of his rigorous intellect into a mighty system, which has already exercised an incalculable influence upon industry and civilization.

That man who, when a boy, was a 'hurrier' in a coal pit, should, by the force of his native genius, rise to a position such as the statue in the Hall at Euston station commemorates, may well be regarded as a proof that the days of romance are not yet over, nor the giants of an older world without their types in modern times. Perhaps it is also to be viewed as a characteristic of the age, that the fame of such a man is so quietly left to the good keeping of the good works which he has achieved. The traveler hastening on his way should pause in Euston station, to contemplate the masculine form and massive, energetic features of him who, by combining the blast pipe with the tubular boiler, first endowed the locomotive with its tremendous speed—who, during his busy manhood, superintended the construction of more than 2,500 miles of railway—throughout every thing connected with our first iron highways—and who engineered lines extending in unbroken series from London to Edinburgh."

A Problem in Trade.—Suppose a large establishment with two or three partners, occupying a store in a business street at $10,000 a year rent, and paying at the rate of 1@2 per cent. a month for their floating capital. Then suppose that each of the partners has a magnificent mansion on a fashionable avenue, a duck of a wife who costs him not over $2,000 a year in pin money and watering-places, with a family of young ladies just "out," and fast young gentlemen very fond of billiards and pretty actresses. Now, these facts being given, with the general understanding that competition and an over supply in the market may reduce the profits on sales to an average of 8@10 per cent,—the problem is, to find out how long it would take this suppositious house to become millionaires.

There is scarce any extravagance so singular as that of wanting a precedent. But custom, without reason, is no better than an ancient error.—*Collier.*

NEVER FEAR.

BY MRS. JENNY A. STONE.

Time may cast a softened shadow
O'er girlhood's laughing brow,
And perchance that shade is stealing
O'er thy tender one even now.
I have glanced through coming years
Bright with hopes and dark with fears,
In life's sky a cloud of sadness
Mingles with my spirit's gladness,
But the heart is changeless, still
All things own through good and ill.

Is it gone, the playful fondness
Which thy weary heart beguiled?
Banish every thought of changing,
I will be once more a child.
We will dream the olden dreams,
Life is brighter than it seems.
Talk as in the days gone by
And my soul shall make reply,
But while thus our fancies range
Deem not that my love may change.

There are blossoms all around us,
Waving plumes on all the trees,
And amid their glorious beauty
Softly floats the perfumed breeze.
Oh, it would be hard to die
With this joy-fraught vision nigh.
Look where last year's leaves are lying,
Emblems of the dead and dying,
Must we wither so? or as they?
Tell me, will our hearts decay?

Scarce one year we've passed together,
If, that we might never part?
Time will change the form I love best,
Dost thou fear 'twill change the heart?
And though many clouds may stray
O'er the sunshine of our way,
Think not that my heart grows colder
As my life is waxing older,
Speak no more of change to me,
Never fear,—it cannot be.

(Written for the Rural New-Yorker.)

TWILIGHT MUSINGS.

"The tender twilight, with a crimson cheek,
Leans on the breast of Evening,
How tenderly the trembling light yet plays
On the far-waving forest! Day's last blush
Still lingers on the billowy waste of leaves
With strange beauty—like the yellow cloth
Which haunts the ocean when the day is gone."

Slowly, yet beautifully, the "glorious orb of light," clothed with all his majesty and grandeur, is fading behind the western hills, tinging the verdant foliage of the forest and the flowery landscape with his golden hue, and shedding a genial influence over all the works of nature. The last, lingering rays of his mellow light have already taken their departure, and the deep gold of sunset, that glows with ineffable beauty as it lingers around his shining couch, too pure and ethereal for earth, is fading, and the dusky shades of evening steal softly o'er the weary world, drawing around us almost insensibly the beautiful twilight hour, with all its subduing influences, and breathing o'er the mind the hallowed stillness of repose. The falling dews distil their fragrant sweetness on the evening air, and breathe their cool, invigorating power o'er the wasted energies of exhausted nature, and every plant and shrub and flower raises its drooping head to revel in the welcome dew-drop, or sport with the evening gales.

The little songsters, that have all the live-long day enlivened the fields and groves with their cheerful music, and sung for us their loudest and sweetest songs, have ceased their warbling and gone to rest in their native bowers, and the noisy hum of the busy bee is still. The weary laborer, burdened with the toils and heat of the day, is slowly wending his homeward path—the dewy breezes sporting with his locks, and his bronzed countenance glowing with the last crimson blush of evening.—The music of nature is hushed in the calm serenity of the twilight hour,—the busy hum of labor is still, and silence reigns, broken only, perhaps, by the low murmur of the distant stream, meandering through the flowery vale, or the plaintive song of the sweet whippoorwill straling over the landscape from the distant grove, on the still air of evening, with strange beauty, then dying away on the ear in tones of unearthly sweetness.

How delightful! when the day is gone, and the shadows of twilight hang sweetly over the earth, to wander in the beautiful fields and bowers, and breathe the cool air of evening, laden with its balmy fragrance and sweet perfume, or gaze with delight on the broad blue dome of heaven, and trace the twinkling stars as one after another appears to shed its soft light on the lovely scene, and give new beauties to the enchantment of the hour.

What a beautiful hour for retrospection!—the mind wanders back over the lapse of years, on memory's downy wings, to the scenes of other days, and faithfully recalls the treasured records of the past, in all the freshness and vivacity of youth. How vividly are pictured in the morning the sportive scenes of childhood—those happy days of pure enjoyment—too bright, and too beautiful, long to last, when in our innocent glee we have often rambled over the hills and meadows to gather the first flowers of spring, and weave them in a garland of innocence and beauty, or breathe their lovely odors dispensed on the evening gale, and the balmy fragrance of the new mown hay, or sported, for hours together, in the grove,

"Where the stream ripples forth through the vale,"

and listened with innocent delight to the merry tones of its gentle flow, as merrily it danced along on its winding way through the flowery vale, till its silvery echoes grew fainter and fainter, and then died away in the distance; then weary and exhausted we have laid ourselves down on its mossy banks and fallen asleep—and, Oh! such sweet dreams of the future! Alas! too bright and too beautiful to be realized. Thus we slumbered on the damp bosom of the earth, while the woodland birds warbled their sweetest carols above our heads, and the gentle breeze, laden with the lovely odors of spring, breathed over us their silent, invigorating power, and long and sweetly we slept. Oh, those were happy hours!—so pure and innocent!—and would they could return again—once more give back their holy charms; but no, they are gone, and gone forever. No effort of the imagination can reanimate those departed joys. Never more shall we mingle again in those joyful scenes with the buoyant hopes of childhood, nor join with the same delight in the innocent glee of that well-remembered group of playmates,

"Whose artless voices echoed o'er the lea,
Or rang out in the stillness of the forest
With a strange beauty,"

and even now we can almost hear the same merry laugh resounding on the still air of evening, though its accents have long since died away. But the scene has changed—that merry group has separated, never, never to meet again as children. Some have grown to the strength of maturity and the vigor of age; others, too frail and delicate for the tumults of life—too pure and heavenly for the trials and sorrows of earth have faded like the last flowers of summer, before the chilling blasts of autumn, and peacefully they sleep in the lonely grave, where the graceful willow droops tenderly over their moldering forms, as if mourning their brief career; or repose in mournful beauty

"Neath the chestnut tree, where the wild flowers bloom,
And the stream ripples forth through the vale,
Where the wild birds warble their songs in spring,"

and the tall, majestic maple casts its broad, deep shadow over the verdant tomb,—where the wild flowers of summer bloom in rich profusion and shed their fragrant sweetness over the ashes of the early dead. Peace to their hallowed memory, and undisturbed be their last repose. Let the dews of heaven fall softly around the consecrated spot, and waste their sweetness on the evening breeze.

What an hour is this for holy thoughts!—Retired from the busy scenes of life, the soul can commune with its Maker, God, and hold sweet converse with the holy angels that float in ethereal purity through "trackless fields of light," mingling their voices in one eternal song of praise, of unearthly sweetness, and bloom forever in perpetual youth, beside the tree of life, in heaven's unfading bowers.

But the twilight hour is fading,—its shadows are deepening in the landscape, and

"Night, sable goddess! from her ebon throne
In rayless majesty, now stretches forth
Her leaden sceptre o'er a slumbering world,"

while the angel Sleep goes forth on his errand of mercy to a weary world: the toilsome routine of business has ceased, the hurried tread of busy feet is still, and all is hushed in unbreathing repose—the weary forget their toils, the mourning their sorrows, and the poor their privations, and long and sweetly they sleep while guardian angels keep their wonted vigils around their sweet repose, and preserve them through the dangers of the night.

Oh! who does not love the twilight hour?—so pure and ethereal, where the crimson flow of sunset burns beautifully in the summer sky, and flings back its soft radiance o'er the dark green "waste of leaves," or fringes the fleecy clouds with its golden tints, and day's last blush blooms brightly on the cheek,—where the pure incense of devotion fills the air with its heavenly odors, and the soft gales of evening, redolent with beauty, whisper their low strains over the chords of the heart,

"In accents milder than Æolian lays."

Southport, N. Y. D. B. A.

Co-operation of the Wife.—No man ever prospered in this world without the co-operation of his wife. If she unites in mutual endeavors with an endearing smile, with what confidence will he resort to his merchandize or his farm, fly over lands, sail upon seas, meet difficulty and encounter danger, if he knows that he is not spending his strength in vain; but that his labor will be rewarded by the sweets of home. Solicitude and disappointment enter the history of every man's life, and he is but half provided for his voyage who finds but an associate for happy hours, while for his months of darkness and distress no sympathizing partner is prepared.

We love to see a woman treading the high and holy path of duty, sublimed by sunshine, unsoured by storm. There are hundreds who do so, from the cradle to the grave—heroines of endurance, of whom the world has never heard, but whose names will be bright hereafter, even beside the brightest angels.

MOORE'S RURAL NEW-YORKER

ROCHESTER, SEPTEMBER 30, 1854.

A New Quarter of the Rural commences next week, and consequently the present is a favorable time to subscribe, or renew expiring subscriptions. All whose subscriptions expire with this number will bear in mind that our invariable rule is to send no paper longer than paid for—that we never visit without invitation, or if so, ask nothing for such unsolicited attention. Hence, those who wish to continue, unbroken, an acquaintance which we trust has thus far proved both agreeable and beneficial, will please notify us individually, or through some friendly medium—the nearest Post-Master or Local Agent. As the season of leisure and long evenings is at hand, many of our friends can easily obtain new subscribers in their respective localities, and thereby benefit all interested. Those renewing their own subscriptions can at the same time readily obtain and forward the names and money of a few friends and neighbors, (those who often *read* the Rural, and *intend* to subscribe,) and thus materially increase the circulation of the paper, and augment its usefulness.

Whig State Convention.

The Whig Convention of this State met at Syracuse on Wednesday, the 20th inst., and nominated the following ticket for State officers: For Governor, Myron H. Clark, of Ontario; Lieut. Governor, Henry J. Raymond, of New York; Canal Commissioner, Henry Fitzhugh, of Oswego; State Prison Inspector, Norwood Bowne, of Delaware.

A series of eleven resolutions were adopted, the first of which asserts the patriotism of the party and its unalterable attachment to the Union. The seven next refer to the slave question, approving the ordinance of 1787; endorsing the Nebraska Bill; repudiating all compromises (except those contained in the constitution) with slavery; eulogizing the course of the New York Senators, and the opponents of the Nebraska Bill in Congress generally; denouncing the administration, its organs and supporters, as slavery propagandists; declaring their aim to be an extension of slave territory, and the re-establishment of the slave trade. The ninth resolution congratulates the people of the State on the triumph of Whig principles in reference to the canals, and the prospect of their early completion. The tenth denounces the late Presidential veto of the River and Harbor Bill, and sustains the doctrine of Federal legislation in aid of internal commerce. The eleventh and last resolution pledges the Whigs of New York to wage uncompromising warfare against the present administration, which, the resolution says, has proved so reckless of duty, and so regardless of the rights and interests of the Union.

Nothing is said in any of the resolutions on the subject of Temperance or the Maine Law, but the fact of the gubernatorial candidate being a strong advocate of the law, is deemed by the knowing ones sufficient to catch temperance votes, while an absence of a direct endorsement in the resolutions will save to the ticket the Whig lovers of good liquor, if any such there be.

Frightful Railroad Accidents.

On the 12th inst. a locomotive on the Virginia and Tennessee Railroad was thrown from the track, which there rests on a trestle work, to the ground, a distance of sixty feet. The conductor and the fireman, a free negro, went down with it, but the engineer escaped by jumping into a gravel car, three of which had been carelessly left on the track by some laborers. The engine was completely wrecked, of course. The negro was immediately killed, and the conductor seriously, perhaps fatally, injured.

The upward and down trains on the Mississippi and Chicago railroad, met on the same day near Joliet, and the latter being entitled to the track, the down train had to return to Joliet, the first turn-out. In backing it was closely followed by the upward-bound train, and the two together made an immense weight on the rails; and when crossing over the Des Plaines River, a short distance from Joliet, one of the freight cars in the down-train jumped the rail, and falling from the sleeper broke the trestling of the bridge, and the whole work, with eight cars, went down into the river together. The cars were literally smashed to pieces, and a large amount of dry goods, boots, shoes and general merchandize, destined for St Louis, totally destroyed or badly damaged.—Fortunately no person was injured.

On the 20th, as the 11 o'clock train from Dayton, on the Cincinnati, Hamilton and Dayton Railroad, was rounding a heavy curve near the depot in Cincinnati, the two hindermost passenger cars ran off the track and fell down an embankment, a distance of ten feet, into the canal, resting bottom upward. No one, so far as ascertained, was killed, but upwards of thirty persons were badly injured.

The Weather has been quite warm and pleasant for the season, during the past week. This, with the previous rains, improves the appearance of mother earth, elongates the pasturage, and indicates that the season of verdure is "to be continued."

Minnesota Correspondence.

St. Paul, Minnesota Ter, Sept. 12, 1854.

Mr. Moore:—Here we are in Minnesota, near the northwest corner of Uncle Sam's dominions, many miles from home, early friends and associations; "among strangers."

We left R. the 23d ult., and at 9 o'clock in the evening found ourselves safely on board the "Plymouth Rock," one of the splendid steamers on Lake Erie, which run in connection with the Michigan Central R. R., and the next morning at 10 o'clock found us in Detroit on board the cars for Chicago, where we arrived at midnight, and remained over the Sabbath. Monday morning we took an early train for Galena, distant some 250 miles. The Chicago and Galena Union R. R. is nearly completed to the latter point. This road, we are told, is constructed through the pleasantest and most fertile part of Illinois. It is certainly a beautiful country. Broad prairies extend on either side, with here and there a grove of oak and a bubbling spring. The farms along the road are fine, and the neat dwellings and spacious barns led us to believe that farmers in Illinois are in "easy circumstances."

Our trip from Galena to this place was very pleasant. We were so fortunate as to secure a passage on the low-water steamer "Luella," Capt. Sam. Boyce, Commander, and although our voyage was rather prolonged, owing to numerous sandbars and a scarcity of water, we were made to feel perfectly at home. With a pleasant boat and a pleasant crew, a sociable lot of passengers, plenty to eat and drink of the best quality, who could not be excelled, to say nothing of the varied scenery which greets the eye of the voyager up the Mississippi? On landing in this city we found a carriage in waiting from the American House, the Astor of the Northwest; and here we are, surrounded by all the "comforts of life." Messrs. L. Loan & Brother know well how to cater for the public taste, and make the stranger feel at home in this far-off territory.

Saint Paul is a very flourishing village of some 6,000 inhabitants, and growing finely, every steamer which arrives adding to its numbers. Land speculation rages *some* in the towns along the river, from $100 to $200 per foot being asked for lots in favorable business localities, and many have lately sold for the above prices. Farming lands, however, are more reasonable, many getting them at government prices, $1,25 per acre.

We see in one of our daily papers, the wheat crop of the territory, for the present season, is estimated by an intelligent farmer at *two hundred thousand bushels*. He says over forty thousand bushels have been raised by the farmers in the *single* district of Cottage Grove, and if this be not an over-estimate, Minnesota will have nearly raised her own bread.

A new enemy to the potato crop is found in this vicinity, in the shape of a little animal called the Gopher, about the size of a rat.—They dig their holes under the hills, and throw out the potatoes, destroying the choicest, and leaving the others on the top of the ground.—We will inform you more particularly of them when we have learned their nature and manner of operations. They are strictly a prairie animal, therefore eastern farmers need not apprehend any trouble from them.

Yours, &c. R. A. Nichols.

Brother T. C. Peters, senior editor of the Wool Grower and Stock Register, has been again nominated for Assembly in the 1st District of Genesee county. Mr. P. has represented the District for the past two years, and his re-nomination is alike creditable to the candidate and constituency. Though his elevation to the Gubernatorial office was properly in order, he is not a man who will be likely to deteriorate ere another State election.

Pioneers of Western New York.—The next Annual Meeting of the Pioneers of Western New York is to be held at the Eagle Hotel, in this city, on Tuesday, the 10th of October ensuing, at 10 o'clock A. M. All who were residents of Western New York on or before the 1st day of January, 1820, are requested, by official call, to attend without further notice.—The Pioneer Portrait Gallery will be open on the day of the meeting, and free to all members. A pleasant and profitable re-union is anticipated.

The Forrest Divorce Case.—This celebrated case is yet in Court undecided. It has been carried up on a bill of exceptions to the Court of Appeals, and is awaiting argument before that august tribunal. Mrs. Forrest obtained a verdict in her favor, and an award of alimony, we believe, by the jury, of about $3,000 a year, during life, for her maintenance. This decision of the Circuit was affirmed by the Supreme Court, and the decree of the present tribunal, if confirmatory also, will be final; but if adverse to Mrs. Forrest, the cause goes back to the Circuit for a new trial. It is rather expensive business for a man to law it with his wife, inasmuch as he is compelled to pay the expenses of both sides whether he wins or loses.

Another Missing Steamer.—The steamer City of Philadelphia, consort of the City of Glasgow, lately lost at sea with all on board, sailed for Liverpool on the 30th of August, since which time nothing has been heard from her, and very serious anxiety is manifested on her account. The recent violent tornadoes that have prevailed on the Atlantic afford ground for reasonable fears that she also may have foundered at sea.

Western Correspondence.

Steamer Empire State, Sept. 2, 1854.

Having our tickets bought at Sheboygan, Wis., through to Buffalo, (for $3 each,) we took the Great Michigan Southern Railroad at the "Crossings," near Michigan City, to Monroe, and it was our good fortune to have contracted an alliance with the company that furnish pure air and water, and a cooler transit in a hot day than any other railroad furnishes! To be able to breathe comfortably in a crowded railway car, and in spite of one's languid feelings, too, when the heat is up to 120° in the sun, is really a matter not so inconsiderable, especially when a "consideration" has been paid, and a constitution put in jeopardy by contact with a tainted atmosphere, made worse than common prison, often, by the diseased bodies and low "spirits" of vile distilleries and nature. This railroad is already furnished with twenty-four passenger cars, having affixed Dr. George F. Foote's [Buffalo, N. Y.] Patent Ventilator, and by the use of which the dust is *entirely* subjugated, and the air replenished *perfectly purified*, and in quantity almost unlimited. A pocket handkerchief let loose when the car is in motion, will wander and fly about like a feather, and finally fly away in a screened aperture in the roof of the car. I procured the following brief and correct description of his invention:

On the top of the car at the centre are placed sheet iron bonnets, (one on each side,) so arranged as to receive the air when the cars are running in either direction, deflecting it downwards through air chambers (placed within and on each side of the car) into a box or tank suspended beneath the floor; from which it is conducted by air tubes opening up into the car through grates in several places along the aisle, thence out again through openings in the top. The tank is of sufficient depth to hold a barrel or more of water—allowing a free passage of air above it. In connection with this water, are pipes leading to a small rotary pump attached to the truck frame, (which is driven by a belt passing around the axle of the car wheel,) then back again to the tank and air chambers, where by a simple arrangement of diffusers the water in its passage is scattered into a fine spray, falling into the tank to be used over again. When the cars are in motion the air rushes in with great force, passing through the spray of water which washes down all dust, smoke, cinders, or other impurities coming up into the car as prior as a summer's atmosphere after a shower, and very much cooled. The water is changed daily when the roads are dusty. The amount of air received is easily regulated by a valve in each air chamber.

During winter instead of water a stove is placed for a tank below the floor which heats the air in its passage, thereby ventillating and warming all parts of the car alike, and that too without the loss of any seats, which in other cars are removed to make room for a stove.

From a gentleman who had tested the hot air arrangement last winter, I learned that the ventilator was perfect in its working and results, and is as useful and as necessary in the cold winter as in the hot summer, as it affords to the passenger a pure and even temperature of air, none being too hot or too cold, and a continual comfort to body and lungs. The common sort of cars in the train were in *all cases* tenantless, so long as a single seat in the patent ones remained unoccupied. A general amen and "God bless the Doctor" went out, and *will* continue to be the cry until all the passenger cars in the land have been doctored and new *Foot-ed*.—The sagacity of the officers of this road in adopting first, generally, this invention, has told immensely already to the purse of the company, by the increase of travel on this route. An appreciating traveling public will be quite sure to advertise gratuitously for this railroad. The company are putting the ventilating "machine" to *all* their passenger cars, and at an expense of about $140 each.

Leaving the cars at Monroe, we walked directly on to the "Empire State" steamer, a splendid craft. The Captain and his Steward are *every inch* gentlemen, took proper care of their vessel and passengers, gave us a safe and pleasant journey, and landed us on board the great Empire State at Buffalo.

After a laborious tramp "out west" of a whole hot summer, I assure you friend Moore, it is not surprising, when brought to a focus by such pleasant associations as those afforded by the Michigan Southern Railroad and Empire State, that a fellow feels glad that he has lived, and that he is still alive. I have a few notes taken *all* over Michigan, that I may possibly frame into a future missile. Till then I am yours, very truly, Peter Saxe.

Death of a Bishop.—The Rt. Rev. Jonathan M. Wainwright, provisional Episcopal Bishop of the Diocese of New York, died in that city on Thursday, the 21st, after an illness of about three weeks. His disease was the Typhoid fever, brought on by fatigue and exposure in the discharge of his official duties. He was a man of eminent learning and piety, and although a firm supporter of the creed of his own church, he was on terms of friendship and good will with his pastoral brethren of all other denominations. The New York press are united in his praise.

Teachers' Institute.—At a meeting of the teachers of the county, held in this city on the 23d inst., the following resolution was adopted:

Resolved, That we request the Town Superintendents of Schools in this county to establish an Institute in said county this fall, pursuant to the act of the Legislature of 1850.

The meeting then adjourned to the first Saturday (6th) of October, at which time a County Association is to be organized and further action taken in regard to the Institute. It is hoped that a full delegation of teachers will be present.

News Paragraphs.

☞ The "New Fashion" for *hats* elicits the following from the New York Times:

"The gentlemen's beavers this fall have the brims set, underneath, with *white* fur, instead of black. The effect is very startling, for it gives you the idea that every man you meet has either been born with flax white locks, or has grown prematurely gray. Fitzboodle says it looks as if a man wore two hats, Jew-Costermonger fashion, instead of one. It is a very curious fashion, and a very new one."

☞ A fashionable New York family, on returning to their city residence last week after a brief sojourn in the country, found that during their absence the rats had gnawed through the water pipe and let in such a flood of Croton water on to the carpets and furniture as almost utterly to destroy them. An elegant piano that cost $380 was sold for $10, in consequence of the injury, and the carpets, rugs and mats were so rotted that they fell to pieces.

☞ The city of Quebec is about to be supplied with pure water from the lake at Lorette. The lake is about ten miles distant, and sufficiently elevated to enable the water to be conveyed to the top of the highest houses in the city. The water has hitherto been carted from the river, and has proved a fertile source of disease, being full of impurity, and with a large percentage of saline matter.

☞ The Savoy Gazette mentions that during an ascent of Mont Blanc by an English gentleman named Blackwell, a curious phenomenon was observed. During the night, by an effect of electricity produced by a storm, all the rocks of the Grands-Mulets were illuminated, and when the persons present raised their arms into the air the tips of their fingers became phosphorescent.

☞ At St. Louis, on the 18th, between 1 and 2 o'clock in the morning, a building temporarily occupied as a magazine for fireworks, was struck by lightning, and a tremendous explosion immediately ensued. The building was entirely destroyed with all its contents, and two men who were sleeping on the premises were instantly killed. The loss of property is about $2,500.

☞ Illinois is a healthy State, one would suppose, from the fact stated by the Jacksonville Journal, that in the year 1829, (twenty-five years ago,) four families having emigrated from one of the older States to Illinois, settled in Morgan county. In these four families there were thirty children, cousins to each other, all of whom are still living.

☞ A fund of $1,500 has been subscribed by gentlemen in Boston, New York, Philadelphia and other places, towards erecting a monument to the memory of the late Mr. Downing, the Horticulturist. It is proposed to erect it in the public grounds of Washington, upon the arrangement of which Mr. Downing was engaged at the time of his death.

☞ A meeting of the Board of Emigration was recently held in New York. It appears from their reports that there are 2,191 emigrants at Ward's Island, and 177 at the Marine Hospital. The total number of emigrants arrived at New York so far this year is 291,136, being an increase of 34,883 on the same time last year.

☞ Dr. Wildman, who recently introduced ominated tincture of iron in the treatment of yellow fever, at Savannah, died of the prevailing epidemic at that city on Sunday, the 17th inst. It is said that he had cured upwards of one hundred and fifty patients with his peculiar remedy since the 21st of August.

☞ The editor of the Providence Journal is a man, every inch of him, when he advises farmers to drive men with guns in their hands off their premises, and says: We never believed that God made birds to be killed for sport; and we are sorry that one live bird, in a civilized country at least, is worth a dozen dead ones.

☞ In the Court of Sessions, at Albany, Judge Robinson has decided that railroad tickets not in the hands of bona fide purchasers are of no intrinsic value, and therefore, not property; and by his direction the jury acquitted Andrew Donnelly, charged with stealing sixty Central railroad tickets.

☞ Forty prizes of £8 each are to be awarded in the schools of art throughout the British kingdom who shall most distinguish themselves during the present year, so that they may have the means of visiting Paris next summer, during the exhibition.

☞ Four of the Cincinnati Dailies, the Enquirer, Commercial, Times, and Columbian, have agreed to raise their terms of subscription from ten to twelve cents per week. The increased cost of paper, labor, &c., is given as the cause of the advance.

☞ The Albany Register says mosquitoes love the blood of fresh beef far better than they do any that flows in the veins of human kind. Just put a couple of generous pieces on plates near your bed at night, and you will sleep undisturbed by these pests.

☞ The Lords of the Treasury have awarded Mr. John Dicker, inspector of mails, the sum of £500, as a compensation for his invention of an apparatus for transferring mail bags to and from railway carriages at full speed, without stopping.

☞ It is computed that the Mormons in Great Britain number about 60,000, in Utah 54,000, and that not less than 40,000 are scattered over Iowa, Illinois, Wisconsin, and other western States, making in all 150,000 belonging to this singular sect.

☞ The new Legislature of Iowa stands:—Senate—Anti-Nebraska 16; Nebraska 14.—House—Anti-Nebraska 40; Nebraska 27; giving an Anti-Nebraska majority in each branch, and 15 majority on joint ballot, which secures an Anti-Nebraska Senator this winter.

☞ Upwards of 400 vessels on the Atlantic Ocean, ninety miles distant, were counted from the Summit House on Mount Washington, on the 11th inst., when the best view since the house was erected was enjoyed.

☞ A correspondent of the Builder says that houses should be painted in the autumn; woodwork painted in October, he says, looks better at the end of four years than, if painted in June, it would at the end of two.

☞ The late violent gale and storm appear to have extended along the entire range of coast from Florida to Bangor, Me. That portion of coast from Georgetown, S. C., to Brunswick, Ga., seems to have suffered most severely.

☞ The Commonwealth newspaper of Boston has been suspended for want of patronage. The good will and effects have been transferred to a party who will publish an anti-Slavery, Temperance and Protestant paper.

News Brevities.

—— Flour has declined in Cincinnati to $7 per barrel.

—— A smart frost was visible in the vicinity of Boston last week Thursday.

—— A new ship in the yard of Mr. Hood, at Somerset, Mass., was burnt on the 21st—loss $60,000.

—— The receipts of new cotton at New Orleans are very large. In one day they reached over 6000 bales.

—— Alexander W. Stow, first Chief Justice of Wisconsin, died at Milwaukee on Friday morning of last week.

—— Lorenzo Saunders shot his brother dead in Louisa county, Va., recently. The murderer has been arrested.

—— A wealthy banker of Chicago named Green has been arrested on suspicion of having poisoned his wife.

—— The Dundee, Yates county, Record says a heavy storm in that place on Tuesday week, prostrated Leat's circus.

—— The General Convention of Universalists of the United States met in Philadelphia on Wednesday the 20th inst.

—— The yellow fever still continues to rage fearfully in the Southern cities. At Galveston its ravages are frightful.

—— There are 237 causes on the calendar, for argument before the Court of Appeals at its next session in Albany.

—— The value of the diamond which has been found lately in Manchester, Va., is said to be three or four thousand dollars.

—— An auction sale of coffee was made in New York, Sept. 20, and the entire catalogue of 3000 bags Rio sold at 10⅛ to 12¾.

—— The Independent Democrats of New Hampshire have called a State Convention, to meet at Concord, on the 20th October.

—— The frost has touched the leaves upon the trees on the White Mountains, and the forests now wear their magnificent autumnal livery.

—— Lieut. Jolly, who had the passage with Commander Hollins at San Juan, has been promoted to the rank of commander in the British service.

—— The Utica Telegraph states that the Oneida County Fair proved a total failure—not a dozen exhibitors remaining on the grounds.

—— Wm. Parrot, aged over 100, died in Lunenburg, Va., on the 20th. He fought under Washington, voted for him and every other President down to Pierce.

—— An Englishman, named Anthony Baker, was robbed, murdered, and his body left upon Galena railroad track, near Chicago, on Saturday night week.

—— Many of the Irish journals are now printed on straw paper, and it is expected that they will soon be printed on paper made of their own bogs.

—— Abram Greenhalt and Jacob Lery, two wealthy Germans, have been arrested in Albany for robbing emigrants on the steamer Hendrick Hudson.

—— Ex-Gov. Wood, of Ohio, now lies dangerously ill at the Irving House, New York.—His disease is Panama fever, contracted on his return from South America.

—— As three boys were playing in a yawl boat at Detroit on the 13th inst., a hundred pound sturgeon bounded into their midst and was killed by them.

—— The Boston Courier says that during the week ending on Friday last, there arrived in that city, by railroads alone, three hundred and fifty-six tons of butter.

—— Depredations to the amount of $13,000 had been committed in the Augusta Post Office by a negro, who confessed his crime, and restored most of the money.

—— The Court of Appeals of Virginia have sustained a verdict given below, to one Hedgie, against Parish & Co., for the upsetting of a stage. The verdict was for $10,000.

—— Mr Webster's interest in the Franklin (N. H.) estate is to be bought by Mr. Paige, one of the trustees, and outside competition is neither expected or desired at the sale.

—— Forty orphan children have just gone west from New York, under the care of the Children's Aid Society. They will be apprenticed to western families.

—— A uniform penny postage is to be proposed for adoption in Ceylon, the deficiency created by the change to be made up by the imposition of new import duties.

—— Maj. A. D. de Wangenheim, the last of the surviving officers who served under Frederick the Great, died a few days since at Altdam, near Stettin, at the age of nearly 92.

—— A fire in Brooklyn, on Sunday night week, destroyed several buildings, and a woman, named Ellen Flanagan, perished in the flames, after getting her child out safely.

—— Pittsburgh and Allegheny cities, both of which suffered severely from the drouth and the cholera, united on the 21st in the observance of a day of public fasting and prayer.

—— The Bank of England has adopted a new plan of impressing the bank notes as well as the checks of that establishment, by very considerable improvements in the machinery.

—— The amount of wealth at Sebastopol is computed to be £20,000,000. The fortifications have cost not less than £7,000,000, and the military and naval stores are of prodigious value.

—— Some idea of the extent of the depot which is to be erected in Albany for the New York Central Railway may be formed from the fact that it is to contain eighteen railway tracks.

—— Not long since, Messrs. Evans & Arrowsmith, of Bristol, England, received at their establishment a sheet of paper weighing 3 cwt., and measuring 2,784 feet in length, or more than half a mile.

—— The pulpit from which the Rev. G. Whitfield, formerly of Crypt Church, preached his first sermon, has been purchased for the new Congregational chapel at Parsonwick Edge, Gloucestershire.

—— A gigantic painting on glass, representing Jesus Christ reaching the apostles to pray, has been executed at Munich, to cover the window of a church at Hamburg. It is forty-five feet high and fourteen and a half wide.

—— Arch-Bishop Hughes has summoned a council of the Bishops of his Province, with their theologians and the leaders of religious orders, to assemble at the Cathedral on the first Sunday in October.

Literary Notices.

THE BETTER LAND; or the Believer's Journey and Future Home. By Rev. Aug. C. Thompson. Boston: Gould & Lincoln.

One by one break the ties which bind the heart of the Christian to earth, but more completely than by any other trial are they severed when friends go before to the Better Land.—This, too, awakens in the soul a new interest in learning all that can be known of their Future Home, for every memory of the departed turns hope and thought thitherward. The volume before us is made up of a series of sermons on Heaven and heavenly-mindedness, and was published in answer to a request of the church of which the author was a pastor, on his leaving them for a visit to Europe. Sold by Wm. N. Sage.

MAP OF THE BALTIC.—There has been laid on our table by Messrs. Ivison & Dutton, Boston, who are acquiring an excellent reputation for similar publications, a well executed map of the Seat of the Eastern War. The design includes the Baltic Sea and the States surrounding it, and the map seems to be in all respects convenient and reliable.

THE LADIES' REPOSITORY for October contains, as usual, two steel engravings, and 48 pages of reading matter of an elevated moral character. Rev. D. W. Clark, Editor. Cincinnati: Swormstedt & Poe. $2.

GODEY'S LADY'S BOOK, for the current month, is promptly at hand. It is an old and well known favorite of the public, having reached its 288th number. Philadelphia: L. A. Godey. $3. DEWEY, agent, Rochester.

MERRY'S MUSEUM is a monthly expressly for the juveniles, edited by their old friend S. G. Goodrich, with rare ability and instructiveness. It is published in New York by S. T. Allen & Co., at $1 per year. Volumes begin in July and January. D. M. Dewey, agent.

Foreign Intelligence.

Arrival of the Arabia.

The Arabia arrived at New York Sept. 21.

Schamyl has surprised the Russian army in Georgia near Gori, and destroyed 200 villages. The Dukes of Cambridge, Prince Napoleon, and the Rifle and other Regiments have left Constantinople for Varna. Lord Raglan would embark at Varna in the Paradise on the 2d and the expedition is to rendezvous at Baltschik. The troops are represented as brimful of enthusiasm. The French troops in the Baltic, it is reported, are to return immediately to France.

Austria still perseveres in supporting the guarantees from Russia, and will await the result of operations against Sebastopol.

The Russians are making preparations to burn Odessa, Pidi, Bakuru, Galatz and Ismail, should they be forced to abandon them.

Russia rejects the propositions of the four Powers, retires behind the Pruth, and there awaits the crisis of events. The reply of the Czar was sent in duplicate to Austria and Prussia. Each of the points insisted upon by the Western Powers, is duly set forth, refused and reasons given therefor. Further the Czar says that he has withdrawn his troops from the Principalities in deference to the interests of the German Powers. Also that he will recall his forces across the Pruth, and there wait another hostile attack or pacific overtures, as may be.

PARIS, Sept. 6.—The Debats says all the accounts which we have of late received from the Black Sea agree in declaring that the cholera, which had made so violent an irruption in the ranks of the army in the East, had declined with a rapidity which could scarcely have been hoped for.

DANTZIC, 7th.—All the Romarsund forts have been destroyed and the boats embarked.

CONSTANTINOPLE, 28th ult.—It is reported that a serious rebellion had broken out in Packalika of Iranen, Moulessche, and Aiden, and that the authorities of those places were some of them murdered and some of them driven away.

Advices from Athens to the 2d, state that the Commander of the French troops now in Greece insists upon removal to Athens, as 1,000 men have died of cholera. The Ministry was endeavoring to re-establish relations with Turkey and a further term had been fixed for the free navigation of Greek merchant vessels in Turkish waters.

ENGLAND.—The Bullion in the Bank has decreased £167,000.

The advance in Breadstuffs was caused by sleight arrivals. The harvest is mostly housed throughout France and Great Britain, and the yield is good and abundant.

SPAIN.—Mr. Soule is charged by the French and Spanish paper with plotting against the tranquility of Spain. He is said to be identified in a cabal against Espartero, and to be connected with another recent attempt at insurrection. The Times correspondent thinks the proof against him so strong that he will not venture back to Madrid.

Maxwell's Circular says that the weather has been very favorable for agricultural purposes, and the imports small. Flour has advanced 1s on the week. Western Canal held at 26s 6d.; Philadelphia and Baltimore 29s 6d; Ohio 32s. Wheat is 3d higher; white 8s 9d; mixed 8s@8s 6d. Corn has declined 6d.

SINGULAR ENCOUNTER.—The Springfield Republican says that seven of a flock of sheep entered a jewelry store in that city on Thursday morning, led off by a stalwart buck. The latter was instantly attracted by the sight of another bristling buck in the large mirror at the end of the store, and lowering his head and taking a fair start, he plunged into his supposed rival. Judge, perhaps, his own and the storekeeper's astonishment at the crash that ensued. One of the four panes of which the mirror was composed, though a third of an inch thick, was shivered in pieces under his well directed blow. The slaughter here interposed and drove off the animals before they could do more mischief.—The glass broken was three feet by four, and cost about $25.

California News.

Arrival of the United States.

NEW ORLEANS, Sept. 23.

The following interesting news is gleaned from the San Francisco papers received here to-day by the steamer United States, and brings 120 passengers and $20,000 in specie on freight.

She left Aspinwall on the 18th.

Great fires have occurred throughout the State since the last steamer—the losses by which sum up nearly $1,000,000.

Business matters were generally in a depressed state, while the accounts from the mines were of the most flattering character.

Agricultural pursuits were also flourishing.

There was hardly a question but that the Whigs would sweep the State at the next election, as the Democratic party appeared to be hopelessly divided.

The French Consul at San Francisco had given notice that all vessels of Marque would be treated as pirates and dealt with accordingly.

Walter Sherwood, of San Francisco, had committed forgeries to the amount of $17,000.

Great preparations are making for war upon the Russian settlements.

The arrival of vessels from the Atlantic ports since the last steamer had been few.

COMMERCIAL SUMMARY.

SAN FRANCISCO, Sept. 1.—The fortnight which has just passed has been distinguished by no important features in the commercial affairs of the city. The amount of goods taken for the fortnight has not been as large as for the preceding period of the same time. Prices for staple articles have undergone no change, with slight exceptions, either from importers or jobbers.

The monetary affairs of the city are favorable, and we hear no complaints of a scarcity of money. The mines continue to make handsome returns.

The general depression in business has affected the price of real estate in the city, but within the last fortnight sales have been made at higher rates than could have been obtained a few months ago. Improvements of all descriptions are rapidly being made in all parts of the city, many of which are of the most permanent character.

The dry goods market has not improved, and the receipts for the last fortnight have not been heavy, yet prices scarcely cover first cost for any descriptions.

DECISIONS UNDER THE POST OFFICE LAWS.—A postage stamp, cut from a stamped envelope, cannot be used for postage.

A postmaster, under no circumstances, is allowed to open a letter not addressed to him.

When letters are missent it is not lawful to charge postage for forwarding.

All newspapers having words written on or in them are subject to letter postage.

To entitle papers to be sent to bona fide subscribers at half a cent each, a full quarter's postage is required in advance.

It is improper for deputy postmasters to remove the wrappers of public documents franked by members of Congress.

No paper or other thing, except bills or receipts of publishers, can be sent enclosed in a newspaper without subjecting the whole to letter postage.

Bona fide subscribers to a weekly paper, whose postoffice is in an adjoining county, are allowed to receive papers published in a county in which they live, free of postage.

Any mark of a pen on a circular, such as dates or anything of the kind, subject it to a letter postage.

ASYLUM FOR IDIOTS.—The foundation of a new asylum for idiots has just been laid at Syracuse, N. Y. The site is on a fine elevation, which overlooks the entire city, the Onondaga Lake, and the valley, which stretches away in the south, on either side of the Onondaga River. Seventeen acres of excellent land, embracing a good orchard and a neat grove of forest trees, are secured to the institution. The whole has a south-easterly aspect. The foundation of the asylum building has been completed. The building has a front of one hundred and fifty-five feet, and is seventy feet deep. It is to be four stories high, and will contain accommodations for one hundred and fifty pupils, which will be amply sufficient for some time to come. The material of which the building is to be constructed is red free stone, obtained at the quarries at Fulton, Oswego County.

AN EXAMPLE OF INDUSTRY.—The Baltimore Patriot says that Samuel Williams, a colored man, has one of the finest farms in Washington County, Maryland. The Hagerstown Herald says, that at the age of thirty-eight years he was a slave in Stafford County, Virginia, but subsequently purchased his freedom from his own earnings. He then bound himself to years of servitude until he could purchase his wife and children, which he accomplished when he was fifty years of age. He now owns a farm worth $10,000, and personal property amounting to several thousands more, all earned by his own labor. He is now seventy-three years of age.

THE MAN WHO DID NOT KNOW HIS FARM WAS ADVERTISED.—The Ogdensburgh Sentinel tells a story of a subscriber who lately stopped his paper, because it contained too many advertisements, and shortly after had his farm advertised and sold for non-payment of taxes, before he knew it. He succeeded in redeeming his property, at a considerable cost, and then concluded to renew his subscription to the Sentinel, which was the only paper that had the news.

The assessed valuation of Boston this year is $225,000,000, a gain of nineteen millions over last year. The bare increase of valuation in that city since 1853 is more than the whole valuation of Portland, Salem, New Bedford, or any New England city, except Providence, R. I. It is half as much as New York with its 750,000 people, and far exceeds that of any other place in the Union.

A young man was ejected from the Detroit Theatre by the manager, for hissing a *danseuse*. The manager was convicted of assault and battery and fined $30, the Court holding that an auditor has a right to hiss if displeased.

At the present moment there are seven cardinals' hats at the disposal of the Pope.

Marriages.

In Hallsdn, on the 20th inst., by the Rev. T. Benedict, JOHN H. SHERWOOD and Miss JULIARTTE JONES, all of the above named place.

Commercial.

BUSINESS AND FINANCE.

THE United States, at New Orleans, brought to a small amount of specie, viz., $70,000, and the two steamers now due at New York, from the Isthmus, will have on board a large supply. The amount of precious metals sent abroad during the week is $1,678,056, and the total for the year thus far is $29,206,756. Some four or five millions of bills of exchange, the Tribune says, have been on the payment of our Government to Mexico.

The money market is comparatively easy, but the stock market is feverish and excited, and the alternate rise and fall in some of the fancies, particularly Erie, is unprecedented in the history of Wall street.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE, Rochester, Sept. 28, 1854.

PRICES have shifted considerably in the market for many leading articles during the week, but the changes seem to be erratic and not altogether uniform. Thus, Wheat, Corn, and Oats, have all declined, while Barley has risen considerably, and presents features of much activity. The market for Wheat and Flour is quite unsettled, with a decided downward tendency, however, and a feeling among shrewd men that it will go lower; the grain sells in the street at $1,15, and Flour in the trade at $9 00; Corn 48 cents; Oats 40, and Barley 85 to 90 cents. White Rye, forward, is worth $2, and common brings $1,50.

Hay is unchanged, but in large supply. Potatoes lower, selling at 50c to six shillings.

Butter has declined in price, and now brings 16 to 18cts.

Rochester Wholesale Prices.

FLOUR AND GRAIN.		**FRUITS AND ROOTS.**	
Flour, bbl.	$9,00	Apples, bush.	37@50

Candles, box	14½	Trout, bbl.	3,00

NEW YORK MARKET—Sept. 25.

FLOUR—Market materially lower. Quite a panic prevailed during the day, and prices declined 50@75c per bbl. Decreased moderate for local trade, and some inquiry for the east. Sales at $8@8,15 rom. to straight State and com. to good Ohio and mixed to fancy Mich.; $8,15@$10 do. Brands. included in the sales are about 1,000 barrels com. State at $8. Canadian flour plenty and dull at $8,50@8 75.

GRAIN—Wheat market dull, and 1d@2c lower. Demand only for milling, and buyers insist upon still lower prices. Sales of good white Mich. at $1,75, while Southern at $1,80. Large parcels of Rye would sell lower than $1,15 @1,19. Sales in lots at $1,20@1,22. Fair business going in Corn, but holders are compelled to accept of lower prices, in order to realize. Sales at 74@75c delivered to prices for mixed, closing with free sellers at 75@75½c for good round parcels. Oats lower. Sales at 48@50½c for State and Western.

PROVISIONS—Pork in market heavy and only a moderate business doing. Sales at $14@24 mess, and $12 for prime. Lard steady; sales at 11c. linseed—a moderate business doing at 13@13c Ohio; 14@15c for State.

ALBANY MARKET—Sept. 25

FLOUR—The flour market continues dull, and prices are lower. The eastern demand is limited, and the home and river trade continue to buy sparingly, and only to meet the consumptive demand. The supply is more than equal to the demand. Sales at $8,25@8,50 for com. to good State, $8,50@9 for good to fancy do., and $9,25@10 for extra brands. In Western flour is only a moderate business doing at $8,50@8,75 for com. to good, and $8,75@9,75 for extra do. Some small parcels of extra Genesee have been sold at $10,12, but the bulk of the sales were made at $10 and there are plenty of sellers at that figure. Corn meal is rather easier, and is selling at $4,56@4,62 per 100 lbs.

GRAIN—Wheat is in moderate demand with a better supply offering, at prices below the views of holders. The demand is limited and confined to home milling. A sale of good white Genesee at about $2,05, which is above the views of some millers—several parcels unsold. Corn opened heavy with a fair supply offering, and in effect sales a decline of 1½@2c per bush. on the closing prices of Saturday were submitted to. The demand is moderate for the trade and for home consumption. Sales Western mixed at 63½ @64c, closing at the inside price. Barley opened dull with a fair but not a large amount offering. Sales fair to good two-rowed in two lots at $1,10@1,12½; prime $1,15, the market closing quiet. Oats quite plenty and very dull.—There were buyers at Lower Lake and State at 40@45c, and buyer Chicago at 53c, measure, which is below the views of holders.

FEED—Sales 1,500 bus. 2d quality at $1,34 per 100 lbs., and 1,100 bus. Middlings at $1,40.

BUFFALO MARKET—Sept. 25.

FLOUR—The market is very dull this morning, and although holders display more readiness to sell at lower rates, buyers hold back under the increasing receipts, for a further decline. The inquiry is for the interior trade, and the sales we note are at $7,75@8 for good to fancy Mich.; $7,62½@7,75 for Ohio; $7@7,50 for com. to choice Illinois.

GRAIN—Wheat quiet and nearly better. We hear of no inquiry this morning, and no sales. Corn dull and receipts large. Buyers hold back for a decline, and 84@84c are the offers—mostly the inside figure. Holders ask 85cts. The sales are at that quotation. Oats quiet—no sales.

ALBANY CATTLE MARKET.—Sept. 25.

AT W. Woolford's Bull's Head, Washington street.—Beef Cattle—650 at market. Prices—Extra $8,00; 1st quality $7,50; 2d do, $6,50@7 ; 3d, $6.

Cows and Calves—Ten in market. Prices range from $25, 30@40.

Sheep and Lambs—1,500 in market. Prices range from $2 to $4 for Sheep, $2,00@3,50 for Lambs.

Swine—Not any in market.

The market has been better this past week for Sheep and Cattle, than it has been for a month back.

CAMBRIDGE CATTLE MARKET.—Sept. 20.

AT market 2,651 Cattle — about 2,004 Beeves, and 674 Stores.

Prices—Market Beef—Extra $8,50 per cwt.; 1st quality, $8; 2d do, $7@7,50; 3d, do, $6@6,50; ordinary, $5,00.

Hides, ¥ cwt. $6,75@7; Tallow $8@8,50; Pelts 40@62c. Calf Skins, 11@12c ¥ lb. Veal Calves $5, $6@7.

STORES—Working Oxen—$90 to $140@180.

COWS AND CALVES—$25 to $51@68. Yearlings, $8 to $9@11. Two years old—$13 to $32@36. Three years old—$35 to $47@51.

SHEEP AND LAMBS—4,846 at market. Prices—Extra—$4,25 to $5@7. By lot—$1,50 to $3@3,40.

Swine—Wholesale, Shoats to peddle 8½c; still hogs to come fed at 4½@5c per lb.

BRIGHTON CATTLE MARKET—Sept. 21.

AT market 1,525 Beef Cattle, 725 Stores, 5,500 Sheep, and 1,400 Swine.

PRICES—Beef Cattle—Quotations are advanced. Several lots were sold for $8,75 at a shrink of 30 per cent. from live weight, and Extra is quoted $8,50@8,75; first quality, $7,75 @8,25; 2d, $7@7,75; 3d, $6,75@6,75.

Stores in demand at an advance from last week. Two year old, $17@25; three year old, $35@44.

Sheep—Sales of lots at $1,92 to $3 25@4.

THE SCIENCE OF NATURE.

A New School Book, entitled First Lessons in Chemistry and Geology, as Applied to Agriculture.

BY J. EMERSON KENT, A. M., M. D.

A NEW school book—the first American work ever issued as the first book, or "First Lessons in Chemistry and Geology, as applied to Agriculture," designed as the first step for the young, to be used in all our common schools, is now submitted to the educational public. Some indeed protest against the introduction of all modern improvements in making the earth productive; still the great agricultural interests of our nation depend upon a rising generation of practical farmers, who will all be full as much so by the sweat of the brow.

The subject of agricultural chemistry cannot but soon commend itself to the world as the most important of all studies, and, in fact, the wealth of this country would be doubled within one year were all that sad ruin which is now lost by stupid, bungling agriculture. A volume of recommendations could be given to the public, but it is not necessary.

School Committees and Teachers will be furnished with a copy, gratis, for examination, by mail, post paid, on application to the undersigned. Price, 25 cents.

DAYTON & EWENTSMITH, Publishers,
80 Washington St., Boston, Mass.

Also for sale in quantities at F. Cowperthwait & Co., Philadelphia; Cady & Burgess, New York; Pillsbury & Co., Buffalo, N. Y.; Hallow & Brother, Rochester, N. Y.; Wm. Wilson, Poughkeepsie, N. Y.; H. M. Rulison, Cincinnati, O.; and by all other booksellers in the United States.

N. B.—A few men of the right ability are wanted to travel through every State in the Union, and introduce this work into schools. A liberal commission will be paid. To a man who loves health or recreation will find this occupation a lucrative and agreeable employment. Address as above. 217-6t

EMPLOYMENT!

WE want an active and energetic Agent in every unoccupied county in the United States and the Canadas, to sell

Goodrich's Last Great Work,

A HISTORY OF ALL NATIONS!

from the earliest period to the present time, or,

Old Castle Nurseries, Geneva, } 245-6t
Hurlaka Co., N. Y., Sept. 9, 1854. }

SYRACUSE NURSERIES, SYRACUSE, N. Y.

THE Subscribers would most respectfully call the attention of Nurserymen, Fruit Growers, Venders, &c., to their *very large* Stock of Fruit and Ornamental Trees, which they offer for sale the coming fall and spring.

We are issuing from the press—
No. 2, A New Fruit Catalogue, which, with
No. 3, Containing the Ornamental Department, and
No. 4, The Green-House Department, will be forwarded to all pre-paid applications, enclosing a *one cent* stamp for each.

Also, a *New Wholesale* Trade List, for persons wishing to trade by the quantity.

A fresh importation of the *very best Dutch Bulbous Roots*, from Haarlem, in Holland, will be ready for delivery in September. Young trees of the following new Pears can be had of us this fall—price $1 each.

That splendid, large, early, melting pear, the *true Hasenscheuk*, coming in after the *Madeleine*, equalling nearly in all respects the *Virgoulieu*, and *more* valuable than any other early pear.

Also, three splendid, luscious, fall pears, the *Des Nonnes* and *Henri Chartou*, first brought to notice by ourselves. These two pears much surpass the *Seckle* also, while they fully rival it in their rich aroma, and possess the melting lusciousness of the *Belle Lucrative*.

Also, *Beurre Clairgeau* and *Kennick*, with that fine winter pear *Beurre Bachelier*.

THORP, SMITH, HANCHETT & CO.
Syracuse, N. Y., July 18, 1854. 238-71row

200 BUSHELS PEACH STONES WANTED.

At the Mt. Hope Nurseries, Mt. Hope Avenue, Rochester, N. Y., for which the highest market price will be paid in cash. [245 4t] ELLWANGER & BARRY.

FARM FOR SALE,

SITUATED in the Southwest part of the town of Castile, Wyoming Co., N. Y., and 1¼ miles from the village of the same name; containing 210 acres, exclusive of Railroad way—155 acres of timber, the balance under improvement. It is well watered by two living streams, and is a good grazing or wheat farm. FARM FOR SALE,

HAVING had an attack of (Minnesota) fever, I have concluded to offer my farm for sale. It contains sixty acres. It is situated five miles south of Albion, and half a mile south of Barre Centre. For further particulars inquire of H. S. BUCKLAND,
Sept., '54. 244-3t Barre Centre, Orleans Co., N. Y.

ANDERSON'S DOUBLE-TRIANGULAR HARROW,

PATENTED August 1st, 1854, is universally acknowledged by agriculturists who have seen it in operation, to be the best Harrow for all purposes now in use. By the particular arrangement of the teeth, the entire surface is thoroughly pulverized. Its peculiar form also renders it very effective in new, uneven, or stumpy ground; one half being made to turn completely over the other in passing a stump, it required. It is fairly admitted that once harrowing with this harrow, does more execution than twice by those in common use. The Patentee, being a practical farmer, is willing to dispose of right in Towns, Counties, or States, for the benefit of the public, or the Harrow may be had on application to WM. ANDERSON,
244-3t Jacksonville, Tompkins Co., N. Y.

10,000 COPIES SOLD IN FOUR WEEKS.

TIMELY TOPICS

For every American Citizen and especially every Voter.

The Constitution of the United States and the Acts of Congress Relating to Slavery, including the Nebraska and Kansas Bill.

THE Fugitive Slave Law of 1793—The Missouri Compromise Act of 1820—The Fugitive Slave Law of 1850—The Constitution of the United States, and the Nebraska and Kansas Bill of 1854—*All for* 15 cts. On the receipt of 15 cts. in P. O. stamps, the Book will be mailed to any address.

AGENTS WANTED to sell this, and *other new works*, in all parts of the country. I have one Agent who has sold 1,300 copies of the *Slave Laws* within two weeks, affording him a profit of $104 for his month's work. Agents can sell this Book anywhere and to any person that can read. UNDERDRAINING TILE.

THE ROCHESTER BRICK AND TILE MANUFACTURING CO., have on hand a large supply, and are constantly manufacturing Tile of the different varieties and sizes used for underdraining farm lands. The relief of the failure of the wheat crop the present season has, more conclusively than it has been for many years before, shown the utility of Tile Draining—for in no instance, and it is safe to say on no premises which lands were properly underdrained, has wheat been known to be injured by winter-kill,—which every one knows is caused by the freezing and thawing of water standing upon the wheat.

The following is a list of the prices for the different varieties and sizes of Underdraining Tile delivered at our premises in Brighton, one and a half miles east of the city of Rochester. The Company will deliver Tile on canal boats at fifty cents advance per thousand, on their yard prices, and on vessels running on Lake Ontario at reasonable charges, for transportation. Prices as follows:

1 Inch Pipe Tile		$1 00	per thousand.
1¼	do	3 00	do.
2	do	9 00	do.
3	do	12 00	do.
4	do	22 00	do.
5	do	5c.	per rod.
2 Inch Horse-shoe Tile		$8 00	per thousand.
3	do do	11 00	do.
4	do do	14 00	do.
8 Inch Round Tile		10c.	per rod.

1000 Tiles will lay 681 rods, or 15 Tiles per rod.

Poetical.

[For Moore's Rural New-Yorker.]

A SONG OF HOME.

BY ROBERT H. KNOWLES.

They may talk to me of the sunny spot,
Where the storms of Winter cometh not;
Of the tropic sweets, and the orange trees,
Which are swayed at will by the gentle breeze.

They may tell me too of the flowers there,
Reflecting in glory the cowslips rare;
Of the glassy lakes in whose placid breast,
The departing sun slowly sinks to rest.

They may talk, and sing, of sorh charms as these,
Of the tropic sweets, and the Summer breeze;
But never shall I thus be tempted to roam,
From the spot that nature has called my home.

I but wish to live, and to be content,
In the home of my youth, with a life well spent;
And to learn at last, from the angel of death,
That the glory of life is a life-time of faith!

Rural Sketch Book.

DO GOOD TO OTHERS.

A TALE FOR YOUNG AND OLD.

"Punish, cousin Philip! don't!"

The speaker was a little girl, scarcely five years old, who was sitting on a stone step of a farm house door, watching very intently the motions of a boy four or five years older than herself. And what was Philip Dale doing?—Why, he had found a poor little stray kitten, which had wandered into the court-yard, and boy-like was driving it hither and thither, shouting, throwing sticks and pebbles at it, while the hunted and terrified little creature ran one way and another, mewing piteously, and every sound went to the heart of the compassionate little child who heard it. At last she could endure it no longer; and running to her cousin, with eyes filled with tears and a voice which trembled from its very earnestness, repeated,

"Don't, Philip, it is God's kitty."

The boy stopped, and looked in her face in amazement; then suddenly seized the fugitive, which had taken refuge in a tree, he laid it gently in the child's arms, and saying, "there's your kitten, Clara," he turned and left the yard. Little Clara ran back into the house, showed her treasure to aunt and sister Fanny, and asked and obtained permission to keep it. Fanny kindly took upon herself the office of making it clean. She softly washed off the dirt, brushed the fur dry, and brought from the kitchen a saucer of milk to feed it; and in no long time the kitten was lying contentedly in Clara's lap purring loudly, and quite as happy as the little girl herself.

Nothing was seen of Philip till dinner time, and when he came in he cast a sly glance at Clara's new pet, as if he almost feared it would complain of him. But he was safe from any reproof save that of his own conscience; for kitten could not tell, Clara would not, and no one else knew anything of the matter. After dinner he tried to make friends with Clara, by offering the kitten some bits of meat, which she took very gladly, and lapped his hands in gratitude, while Clara looked up with a face so bright and smiling, it was plain she had forgotten the affair of the morning. Philip set off for school, and seeing a robin, picked up a stone to throw at it, when a sudden thought checked him, and the stone fell from his hand.

"I suppose Clara would say that is God's robin too," he said half aloud; "and the squirrels and the cows, and everything else. What a queer little thing she is! won't even kill a fly, because she says she couldn't make it alive again if she should."

And he went on pondering the matter. He was not a cruel boy naturally. He loved his parents and his gentle little cousin dearly; and no one could be kinder to the horse, and the fowls, and his dog Bruno, than was Philip Dale. But he had learned from his companions, the wicked habit of tormenting animals for sport, without giving a thought to the pain he was inflicting; and though his mother's soft "Don't do so, my son," always stopped him for a time, she was not always present when he was indulging himself in such amusements.—Not one word said Philip of the subject which had occupied his thoughts all day, until evening when Fanny had gone to put Clara to bed, and all was quiet. Then he came to his mother and laying his head in her lap, and looking up into her clear loving eyes, told her of his conduct in the morning, and of Clara's entreaty. And Mrs. Dale entering with ready sympathy into her boy's thoughts and feelings, conversed with him about the animals, and his duties to them, and so deepened the impression on his mind, that Philip resolved never again to ill-treat any animal; and he kept his resolution, too.

Some months after, when Clara had been for some time at her city home, Mr. Dale asked Philip one bright morning if he could go to town for him to do some errands. They lived within two or three miles of the town, and it was by no means a long walk for a healthy, active boy, and Philip joyfully consented to the proposal. He took his basket and went merrily on, whistling the prettiest he knew, and speaking with the numerous acquaintances he met, and in good time reached his destination. As he went forward he chanced to spy a boy whom he knew, cruelly beating a dog, which howled with pain, Philip crossed the street.

"What is the matter, Jerry?" he asked, "what has Ponto been doing."

Jerry glanced round at him; but Philip's pleasant face and kind tone disarmed his anger, and he answered rather sullenly,

"He stole my breakfast, and I'll punish him for it."

And he raised his stick again, but Philip caught his arm.

"I wouldn't beat him, Jerry, he was hungry, poor fellow, and didn't know he was getting your breakfast. Here's a nice luncheon mother gave me, take it, Jerry, for I had my breakfast long ago; and don't beat Ponto any more. He is one of God's creatures, you know, and we must not abuse them."

Jerry hesitated, took the offered gift and began to eat; for, as Phillip suspected, he was as hungry as the dog; and after a minute he stooped down, and putting the poor creature shared his meal with him; while his young friend, pleased to see it, ran merrily on to do his errands in town, without giving a thought to the loss of his luncheon. Philip little knew how much good he had done. While he talked with Jerry, two men passed in different directions; one a ragged looking man, with a face bearing the marks of intemperance; the other, handsomely dressed, with a pleasant, open countenance, and cheerful smile. This was Frank Howard, a thriving young merchant; the other was Joe Dennis, a poor laborer, who made himself still poorer by wasting his earnings in liquor. Howard glanced at the man as he passed with disgust and scorn; and Dennis, on his part, looked at the young merchant with despairing envy.

"I might have been as well off as he, perhaps," was his thought; "his father and mine were schoolmates and playfellows once: but it's no use now."

It was just as they met and passed each other, at the very spot where the boys were talking, that Philip had said the last words to Jerry.

"One of God's creatures," repeated Howard, involuntarily turning to look after the drunkard. "One of my brethren, then; can I do nothing to save him?" One instant he hesitated and then slowly followed Dennis.

"One of God's creatures," said poor Joe to himself. "Well, I suppose I'm that, only no one seems to think so; and why should they; I'm worse than that brute, for I take the food from my wife and children." He paused: for he was close by a dram shop, where he had too often stopped.

"No *I won't!*" he said energetically: "I'll try once more to leave off. One of God's creatures?. If he takes care of the dumb beast why shouldn't he of us? I don't know who else will."

Joe marched on with a firmer step, for his resolve to do right had given him courage, and soon reached his wretched home. Mrs. Dennis looked up, hastily, one or two children glanced timidly at their father.

"I haven't taken a drop to-day, Martha," said he, "and by God's help, I won't again — Here, Joey, take this fourpence and get a loaf of bread." Mrs. Dennis too happy to speak, could only throw her arms around her husband's neck and cry. "Don't, Martha, don't," said the poor man. "You're nothing to be so glad about; for that's the last cent I've got in the world, and I don't know where the next will come from. Ah, yes!" answering her broken words, "it's easy for you to say, 'Trust in the Lord,' for you're a good woman, but it isn't so easy for me."

Just then a knock was heard at the door, and Frank Howard walked in. "Does not Joseph Dennis live here," he asked. "Are you at liberty to-day, Mr. Dennis, and could you do some jobs at my store? The man I have heretofore employed has left town, and I must get some one to supply his place. Will you come to-day and try? Perhaps we may make some agreement?"

Poor Joe Dennis! he almost worshipped Howard as an angel from heaven. He looked one way and another, and finally burst into tears.

"I'll come, Mr. Howard, I'll come; it's very good of you, for there isn't many who would employ a drunkard like me; but I mean to be sober in future. I was just telling Martha that I could get no work, and we'll go to starve, may be; and she, good soul, said the Lord would provide. I believe, Mr. Howard, God sent you to us just now."

"I have no doubt he did," answered Howard gravely, who having followed Dennis, had heard and seen all that had passed before he entered. Mr. Dennis, if you will go to my store, and say to my clerk, Mr. Reid, that I sent you, he will employ you; and I will be there directly, myself." And as soon as Dennis had left the house, the young merchant turned to the happy, weeping wife, and putting five dollars into her hand, bade her to regard it as a gift from heaven, and provide what she most needed, adding with a smile, "Your husband will return hungry, no doubt; I should advise you to have a good dinner ready."

We need hardly to say that this advice was followed; and that Dennis found a smoking dinner on the table when he returned at noon. But it may be necessary to add, that their new friend kept Joe in his employ, and aided his efforts at amendment, until, in a few years, the neat, nice dwelling, and comfortable, happy looking family which Dennis eagerly sought after his day's labors, bore but slight resemblance to a cheerless hovel, and pale, starving faces he had left. Nor was this all. Frank Howard having once tasted the pleasures of benevolence, could not resign the luxury of being the dispenser of God's bounty to others. And many were the hearts cheered, many the homes preserved, many characters saved from ruin, by his kindly and unsought assistance. He sought no public notice of his good deeds; he was pleased to labor in secret. But Philip Dale often wondered why Mr. Howard always spoke so kindly to him, and invited him so frequently to his pleasant house. Philip never suspected that his kind care for a suffering animal had been the means of saving many human beings from worse suffering, and just as little did Clara think when she played with her kitten Friskie, now grown quite a cat, that her compassionate pleading for her was the first link in a long chain of benevolent actions. Only believe that no good word or deed is ever lost; and, in his own good time, God will make it bring forth rich fruit.

HATRED is so durable and so obstinate, that reconciliation on a sick bed is the sweetest sign of death.—*Bruyere.*

DRIVES AND STREETS OF PARIS.

THE great fashionable promenade of Paris is the Bois de Boulogne, where, and especially on a Sunday, all who can raise any sort of an equipage go out for a drive. The Emperor is making a little river there just now, which in August is to be filled from the Seine, and he is remodeling the woods and the rivulets without much apparent regard to francs and centimes—all, it is said, to keep labor out of mischief, by giving it work enough to do. The Bois (the wood) is the resort of the Empress, with her courier, her out-riders, her postillions, her four dashing horses, her attendants, &c. I caught but a glimpse of Her Majesty as she was driven by with speed. The Bois, too, is the resort of capitalist, banker, general, noble-blemen—everybody, indeed, that can buy and equip the horses, and dress out sufficiently well their wives and their families in Cashmere shawls, diamond breastpins, bracelets, &c.

The ladies in Paris, in cool weather, dress but little, very little in the streets; but for a drive in the Bois, they seem to put on everything they can raise in order to make a display. Hence, this is the best place for seeing fashionable, showy Paris, or Paris as it is, in a fine panorama. We have no like places in the United States—unless such as Hyde Park in London, or the Bois just out of Paris; and hence it is impossible for us to imagine or picture what a great city can show, if it tries, in wealth and elegance. The expenditures for these displays are so large, that it seems to me the New York carriage makers and traders could of themselves almost pay for a Park on our island, in order to tempt our people who have money to spend in the like way. It is, for the world, a truer expenditure than in eating and drinking at balls, dinners, and parties, or in furniture seldom or never used. And it is better, too, that the rich thus spend their incomes than roll up or hound up income upon income, which in the end may be injurious to society by its magnitude and weight. I never object to a rich man's spending his money.—The more the better, if in no mischievous way.

If the admirable municipal government of London and other British cities impressed me, so does this the more. The streets are kept as clean as need be, nay, as can be, I may add. They are swept at night, or before the inhabitants are up or out in the morning; and they are swept in all sorts of weather, as much in rain as in sunshine. Where building is going on the lots are fenced in, or where buildings are being torn down. Where dust is drawn off or drawn in, the carts are so constructed that they do not shed it over every thoroughfare, as ours do, so that a load going from Union square to the river, often becomes no load at all when it gets there. The Five Points parts of Paris are kept just as clean as Genin kept Broadway. There are no dirty streets that I could find. Hence the air is kept comparatively sweet and pure, even among a population crowded more than ours.

True, very true, London and Paris are not under the hot, burning, summer sun of New York, but their fogs and frequent rains are almost as discouraging to the street cleaners.

Amidst these rains the Parisian street-sweepers are always at work; and when the sun makes dust, the city is carefully sprinkled in all the principal streets and the principal suburbs. All the labor is so well regulated and systematised that I doubt if the street cleaning of Paris, about four times as large as New York, costs as much as that of New York.—The drives in the Bois de Boulogne, a half-hour, or three-fourths of an hour's drive out Paris, are daily and twice a day sprinkled if necessary. The shopkeeper who may be taxed, for all this doubtless receives back more than his taxes, and with interest, in the increased luxuries which such a comfortable and delicious drive tempts the rich to indulge in. Hundreds of carriages are kept mainly for such a "turn out," and thousands and tens of thousands of dollars are expended upon harness, saddles, liveries, carriages, robes, shawls, bonnets, jewels, and such like things. Our dirty streets and the absence of all open parks or avenues for such drives are excluding from our city thousands and thousands of dollars in similar expenditures, though if dollar for dollar could be compared between New York and Paris, I am inclined to think that now we have, with one-fourth of the population, nearly as much wealth as Paris can really claim as her own.—*Cor. N. Y. Express.*

A SHORT ROMANCE.

THE following romantic incident is said to have occurred a few years before the Russian conquest of Armenia. The Sirdar fell violently in love with a beautiful Armenian maiden, and demanded her from her parents. Their supplications, and those of the girl herself, were unavailing; for although she had a lover, she was not formally betrothed; she was carried off to the harem.

During the night her lover entered the palace gardens, and in a low voice commenced singing beneath the windows of the harem, in the hope that she would hear him. Soon a window was opened, and some one leaped out. Fearing that his singing had betrayed him, he fled; but as he heard nothing more, he crept back, and found his beloved caught in the branches of a tree, which had broken her descent to the ground. He helped her down and they prepared for flight, but being overheard, they were pursued and caught, and in the morning they were brought before the Sirdar. When the latter had heard the circumstances of the case, he exclaimed, "I see that in the sight of God you were already betrothed. Lovers so true should never be parted.—Live happily together, and God be with you."—*Baron Von Haxthausen's Sketches.*

WE avoid a snarling dog, not because we fear him, but because he disturbs us; so it is with snarling men.

A WISE man stands firm in all extremities, and bears the lot of his humanity with a divine temper.

Youth's Corner.

ILLUSTRATED REBUS, NO. 40

☞ Answer next week.

GEOGRAPHICAL ENIGMA.

I am composed of 37 letters.

My 1, 10, 6, 9 is a county in Kentucky.

My 16, 28, 18, 31, 3, 2, 37, 28 is a river in Mexico.

My 7, 9, 3, 2, 9, 29, 28, 35, 37 is a town in Vermont.

My 28, 11, 13, 5, 19, 34, is a county in New York.

My 34, 9, 11, 5, 6, 2, 4, 2, 12, 36 is a lake in Iowa.

My 18, 5, 33, 15, 8 is a county in Missouri.

My 2, 18, 4, 1 is a chain of mountains in Europe.

My 16, 31, 5, 7, 9, 5, 35 is a town in England.

My 36, 28, 12, 3, 5 is a river in France.

My 3, 31, 5, 2 is a county in Tennessee.

My 16, 31, 12, 18, 18, 15, 16, 34, 30, 31, 22 is a town in Ohio.

My 5, 25, 18 is a river in Indiana.

My 8, 11, 16, 18, 2, 12, 6 is a town in Michigan.

My 37, 5, 7, 31, 10 is a county in Arkansas.

My 3, 2, 18, 5, 12, 19, 31 is a town in Mississippi.

My 28, 19, 5, 5, 16, 31, 26, 22 is a river in Georgia.

My 4, 15, 18, 25, 9 is a mountain in North Carolina.

My 8, 4, 2, 3, 9, 10 is a town in Alabama.

My 5, 37, 19, 22, 29, 12, 32, 36, 37 is a county in South Carolina.

My 6, 5, 37 is a river in Louisiana.

My whole is the name of a valuable statistical work of reference.

Barre, N. Y.

CHARADE.

Most given by nature to be low,
By art I'm well conducted,
And raised to station eminent,
And strangely I'm constructed.

For though five letters make my name,
There stands a fire between 'em:
And turn them round I'm just the same,
My being no bath fixed 'em.

But more—I stand for one (if you
My head and tail does order)
That lived more years than many live,
And very near forever.—*Blackwood's Mag.*

Answer to Illustrated Rebus No. 38.—*Beware of pickpockets, and see to your money.*

Answer to Arithmetical Problem.—1 *orange*, 20 *lemons*, 7 *apples*, 12 *plums*.

Answer to Miscellaneous Enigma.—*Ay, but to die, and go we know not where—'tis too horrible.*

Wit and Humor.

A POETICAL EDITOR.—The editor of the Fall River News has taken to writing poetry, as the following will show; it contains as much truth as poetry:

"Breathes there a man with soul so dead—who never to himself has said—I will my district paper take, both for my own and family's sake? If such there be let him repent—and here the paper to him sent, and if he'll pass a happy winter—he in advance shall pay the printer."

THE EXPLANATION.—One of the two gentlemen recently conversing about the Natural Bridge of Virginia, remarked that there was an extraordinary incident connected with it, for that Gen. Washington once threw a dollar completely over it, an achievement which has not been performed since.

"No wonder," replied his companion, "for a dollar in those days could be made to go a great deal further than at the present time."

A FACETIOUS boy asked one of his playmates why a hardware dealer was like a bootmaker? The latter, somewhat puzzled, gave it up.—Why, said the other, because one sold the nails, and the other nailed the soles.

"I WOULD advise you to put your head in a dye-tub, it is rather red," said a joker to a sandy-haired girl. "I, in return," said Nancy, "would advise you to put yours in an oven, as it is rather soft."

A DRUNKEN youth got out of his calculation and was dozing in the street, when the bells roused him by the ringing for fire. "Nine, ten, eleven, twelve, thirteen, fourteen!" he cried. "Well, if it isn't later than I ever knew it!"

"THE tree is known by its fruit." The only exception to this is the dog-wood, which is known by its bark.

WE generally say of a mill in full operation that it is running; and it is quite proper—for who has not seen a mill race?

PLEADING at the bar, is trying to persuade a bar-keeper to trust you for a three cent nipper.

Fairfield Classical Academy and Female Collegiate Institute.

REV. L. D. STEBBINS, A. M., PRINCIPAL.

THIS Institution is located at Fairfield, Herkimer Co., N. Y., upon a beautiful range of hills, in one of the healthiest villages in the State, and is reached by a line of stages from the Central Railroad at Little Falls and Brockett's, by 10 miles travel. It has of over fifty years of faithful instruction and good discipline, attained a large reputation. Its libraries and apparatus are hardly equalled by any academy in the State.

It has 3 large, commodious buildings all in a pleasant grove. Its Faculty is large and competent. The Principal is a gentleman of superior qualifications. The next term will begin November 8th. Board, room furnished, boil, washing, incidental expenses, tuition in common English, only $30 per quarter. Conveyance free from Rochester, Auburn, Syracuse, Watertown—time being trifling to Department of Tuition. There is a complete academic course for Ladies, and full courses for gentlemen for business and College, and teaching. For the Ladies there is a large Gymnasium for daily exercise.

For circulars and terms, address the Principal at Fairfield, Herkimer Co., N. Y. J. SMITH, Pres't
J. HATHER, Sec'y. 245 4mos

HICKOK'S PATENT CIDER MILL,

As improved for 1854 received over Fifty Premiums and Diplomas in 1853. This Mill is warranted superior to all others. Sold by the following Agents, who will supply pamphlets containing descriptions, &c.:

GAFFNEY, BURKE & CO.,

IMPORTERS, WHOLESALE AND RETAIL DEALERS IN

Foreign and Domestic Dry Goods,

No. 53 Main Street, and Nos. 1 and 3 North St. Paul Street,
GAFFNEY'S BLOCK, ROCHESTER,

Have now in store one of the largest stocks of Dry Goods ever brought to this city, in which may be found every desirable article of Ladies' and Gents' Dress Goods, adapted to the season. Their imported facilities for importing, and the great advantage of having a resident partner in New York, daily attending the Auction Sales, enable them to offer to Merchants and Dealers, by jobber, case or lots, as cheap as can be purchased in the New York and Boston Markets.

WHOLESALE ROOMS, Nos. 1 & 3 North St. Paul St.,
GAFFNEY'S BLOCK, ROCHESTER.

Summer Dress Goods.—We have just opened a very large stock of Summer Dress Goods, consisting of a fine assortment of Brilliants, plain and figured Barages and Tissues, plaid and striped Pongee Silks, Muslins, plaid and striped Lawns, Printed Jacconets, &c., &c. The styles are entirely new and beautiful.
GAFFNEY, BURKE & CO., 53 Main St., Rochester.

Broche and Crape Shawls.—We have now on hand a very large stock of Broche and Crape Shawls, all colors and qualities, which we are selling at very great bargains, as they were purchased much less than cost to import, at an Auction Sale.
GAFFNEY, BURKE & CO.,
Gaffney's Block, 53 Main St., Rochester.

More New Silks.—We have just received another large assortment of Summer Silks, from an Auction Sale, which were purchased CHEAP FOR CASH, and will be sold at less than cost to import. The styles are very handsome and entirely new. We have also just received 40 pieces of those celebrated BLACK SILKS, which we are selling as cheap as usual. GAFFNEY, BURKE, & CO.,
53 MAIN ST., GAFFNEY'S BLOCK, ROCHESTER.

ENGLISH CATTLE.

To Agricultural Societies, and others requiring the best bred Cattle from England, embracing pure blood Horses, Short Horned Cattle, Herons, Herefords, Ayrshire and Alderney Cows, pure bred South Down, Cotswold and Leicester Sheep, Suffolk, Essex and Berkshire Swine. Imported on commission by Messrs. Thos. Brits & Brothers, Herts, England. For information apply to J. H. Miller, 31 Maiden Lane, N. Y. City, who is fully authorized to act as our agent. Orders received for Guano, by applying to
231-13t THOMAS BEITS, 25 Wall St.

WOOD AND COPPER PLATE ENGRAVING.

MILLER & MIX, Designers and Engravers, No. 10, third story, Arcade, Rochester, N. Y., will be happy to exhibit specimens of their work, embracing a great variety of Book illustrations, views of public and private buildings, landscapes, portraits, machinery, society seals, &c. Particular attention given to engraving Agricultural Implements, Portraits of Domestic Animals, &c.

Invitation, Wedding, Visiting and Business Cards Engraved and Printed at short notice, and in a style to give entire satisfaction. Orders by mail will receive as prompt attention as though ordered personally. L. C. MIX.
231-tf JOHN MILLER.

THE WOOL GROWER AND STOCK REGISTER,

VOL. VI.—ENLARGED AND IMPROVED!

THE WOOL GROWER AND STOCK REGISTER is the *only* American journal devoted to the important and practical branches of *Wool and Stock Husbandry*. It contains a vast amount of *useful* and *reliable* information on the above and kindred subjects, and should be in the hands of every owner or breeder of Sheep, Cattle, Horses, Swine, or Poultry—whether located East or West, North or South, for the most of the matter given in its pages is equally adapted in all sections of the Union, the Canadas, &c. The Sixth Volume, commencing July, 1854, will be

Enlarged to 32 Octavo Pages Monthly!

And improved in both Contents and Appearance. Among other matters of interest to Wool Growers, Breeders, Graziers, Dairymen, &c., the new volume will contain Engravings of PURE-BRED Cattle, Horses, Sheep, etc., and the Names and Residences of the principal Breeders and Owners of Improved Stock throughout the country. It is published in the BEST STYLE, and ILLUSTRATED WITH MANY ENGRAVINGS—to include Portraits of Domestic Animals, Designs of Farm Buildings, &c., &c. The careful REVIEWS OF THE WOOL AND CATTLE MARKETS, given in each number, are alone worth many times the price of the paper.—To Wool Growers this feature is invaluable.

TERMS—Only Fifty Cents a Year;

Five Copies for $2; Eight for $3,—*in advance*. Any additional number at 37½ cents per copy. Club papers will be sent to different post-offices, if desired. ☞ Back volumes (well bound in paper, for mailing) furnished at above rates.

☞ NOW IS THE TIME TO SUBSCRIBE and form Clubs. Money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

☞ Mr. C. MOORE, of Gerry, Chau. Co., is authorized to act as Agent for the RURAL NEW-YORKER, and for the WOOL GROWER AND STOCK REGISTER, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

☞ The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance*. The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicine, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper.

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. Bixby,—H. C. White,—T. E. Wetmore.

The Rural New-Yorker is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete Agricultural, Literary and Family Newspaper.

☞ For Terms, &c., see last page. ☜

Rural New-Yorker.

Progress and Improvement.

FARMERS GOING WEST.

During the past year there has been a large increase of emigration from the Eastern, Middle and Northern States to the West. The agricultural prosperity of Michigan, Illinois, Wisconsin, Indiana and Iowa—and the opening of Minnesota, Kansas and Nebraska, by which the rich soil and fine climate of those Territories are becoming patent to the people of the whole country—have very naturally attracted the attention of the people of the East, and induced either direct emigration, or, with that view, personal investigation. The high prices of farming lands in Western New York, and other superior agricultural districts, and desirable localities, in this and other States, and the comparative cheapness of improved or partially improved farms situated on or near railroads or navigable streams in the Western States heretofore named, have given an impetus to agricultural emigration—while the favorable reports concerning the new territories have exercised a powerful influence in the same direction. Within a few months hundreds of persons who own farms of from 50 to 100 acres, have disposed of them at the advanced rates, ($50 to $150 per acre,) and purchased, at a comparatively trifling cost, large farms or tracts of unimproved land in the West. A portion of this emigration has been caused by the grasping disposition of many of our wealthy farmers, whose desire to own "all the land that joins them," has induced the purchase of adjoining farms at unusually high figures—a course not generally productive of benefit to community, or calculated to enhance Rural Improvement. In old sections, where land is dear, fields small and devoted to mixed husbandry, large farms are neither desirable nor the most profitable, and hence we regret the diminution of the number of soil owners and cultivators.

In some localities the western fever is superinduced by poor farming, and the consequent deterioration and barrenness of the soil—naturally rich and fertile lands being worn out by the "skinning system" and general mismanagement. Those who do not believe in, or at least will not adopt, deep plowing, manuring, rotation, and other improvements—men who "know the right and still the wrong pursue"—find that their mode of farming *don't pay*; and, being too stupid to improve, or having too great a veneration for ancestors to depart from their stereotyped practices, are either obliged to sell and seek a virgin soil, or suffer both poverty and reproach. Such people—we will not call them farmers—of course benefit a district by leaving, (even if they depart secretly, between two days,) and generally advance their own interests—a change mutually satisfactory to themselves and community! Their exodus makes room for far better farmers and citizens. True, those who thus depart are not of the right stamp and mettle to settle in a new country, yet it is hoped their posterity at least will be benefitted by a change which may lead to improvement.

Among others, the reasons already mentioned are inducing a strong tide of emigration westward, and naturally causing considerable inquiry as to the best locations for farming. We are in frequent receipt of letters soliciting information relative to the topography, soil, climate, &c., of various sections of the West, which we are unable to answer definitely from personal knowledge and observation,—and feel incompetent to speak advisedly, as we are often requested to do, concerning the particular advantages of this or that Western State or Territory, compared with another, or with Western New York. There are so many items to be considered, not a few of which are estimated differently by different individuals, that even those best informed arrive at opposite conclusions. For instance, one looks mainly for a rich soil, another for a healthy locality, another for society and religious and educational privileges, while others have different objects in view.

Compared with Western New York, we hold and firmly believe, there is no district of equal extent which combines so many advantages—soil, climate, society, churches, schools, morality, intelligence and enterprise of the people, markets, facilities for travel, &c., &c.—Of course no one expects all these at the West, and hence those who propose moving should seek a locality embracing the advantages considered of first importance in their estimation. Were we asked to designate what Western *States* we consider best for farming purposes, with other advantages usually esteemed by the people of this region, we should name Michigan, Wisconsin and Iowa. The latter is progressing more rapidly, probably, than any other, and presents many inducements to young men of enterprise and limited means. Many sections of Michigan, Wisconsin and Illinois, and some parts of Indiana, are desirable for those who wish to obtain improved or partially improved farms, at comparatively low prices, in good neighborhoods, and with educational and religious privileges.

In regard to the new Territories, we should prefer Kansas, though Minnesota has its advantages. Our impression is that Iowa and Kansas are at this moment the most desirable points for young men, and women too, of limited means, if properly imbued with enterprise and determination.

IMPROVEMENT OF PERMANENT MEADOWS.

From the constantly increasing price of hay, farmers are beginning to give the subject of the improvement of grass lands and permanent meadows their earnest consideration, and we confidently look forward to the speedy introduction of underdraining, irrigating and top-dressing permanent meadows to an extent altogether improbable but for our well-known go-a-head habits.

The practice of underdraining meadows will appear ridiculous to some who have never witnessed the great improvement in the *quality* and quantity of hay produced by it. Underdraining lies at the very foundation of all improvement of meadows. Irrigation and top-dressing are comparatively useless on any meadow surcharged, nine months of the year, with stagnant water. There are hundreds of thousands of acres which now produce nothing but coarse, innutritious herbage, which by underdraining would become the most profitable land on the farm. And much of such land is so situated that it could be irrigated with very little trouble or expense. A dam on a natural stream, and cutting a few artificial ditches, are in many situations all that are necessary to irrigate a large meadow. The English farmers are far behind those of several countries of Europe in irrigation, but they are very far in advance of American Agriculturists, while, from their moist climate, the advantages of irrigation would be supposed to be less than in our dry, hot, short seasons. There are but few farms in England on which there is not a permanent meadow more or less artificially watered. And the immense quantity of fodder produced on these lands materially helps to keep up and increase the fertility of the upland portions of the farm.

Hay is now worth as much in Rochester as in most of the Provincial Towns of England, and any system of meadow management which is found profitable there, would be likely to prove equally profitable here; for the difference in labor would scarcely affect the question. Peruvian guano is there used to a considerable extent as a top-dressing on meadows, and it is reasonable to suppose that the practice proves profitable, otherwise it would long ere this have been abandoned. Superphosphate of lime has also been used as a top-dressing on meadows, but, though there are many experiments published giving highly satisfactory results, yet practical farmers appear to have decided that guano and nitrate of soda, when it can be obtained at a reasonable price, are much the cheapest manures for meadows. An English farmer once showed us a large field, on six acres of which he had sown a ton of Peruvian guano (2,240 lbs.,) and on six acres at the opposite end of the field a ton of superphosphate of lime, while the centre had nothing. The manured six acres produced a good crop of hay, while that with superphosphate was no better than the part that received nothing, and which yielded a crop of grass scarcely worth cutting.

The Editor of the *American Agriculturist* has this year made an experiment in top-dressing an old meadow, seeded down some twelve years ago, which, though on a smaller scale (the fortieth part of an acre) than we should prefer, is interesting and instructive. The plot on which nothing was sown produced 2,360 lbs. per acre. A plot dressed with 600 lbs. of "Mapes's improved superphosphate of lime," 2,800 lbs. A plot dressed with 600 lbs. of Dr Bird's superphosphate of lime, 3,360 lbs., and a plot with 600 lbs. Peruvian guano, 4,160 lbs. per acre. The Editor adds that "now [Sept. 1] the after-math is looking much the best upon the plot treated with guano." He thinks that "it is quite evident that it will pay well to dress old mowing fields with Peruvian guano, but it ought to be applied very early in the spring, and directly after thorough harrowing or scarifying the old sod."

We agree with the *Agriculturist* in thinking that in many locations where hay commands a high price, no application of good Peruvian guano will *pay*. But meadows may be improved without purchasing guano or even "Mapes's improved superphosphate of lime." On an underdrained meadow, a top-dressing of well-rotted barn-yard manure, or what is much better, a good compost of barn-yard manure, plaster, loam, peat, &c., *applied in the fall*, cannot fail to be of great benefit and to pay. But, mark you, the meadow must be drained so that, as the rains in the fall and spring wash out the soluble portions of the manure, they may be retained in the soil as the water filters through to the drains beneath. If it is not underdrained, the policy of top-dressing in the fall may well be questioned, for in such a case much of the valuable portion of the manure would be washed out, and carried away in surface ditches. On an underdrained, rather retentive meadow, we believe guano, and all other fertilizers, should be applied in the fall. It is clearly demonstrated that the fall is the best time to apply guano, sulphate of ammonia, rape cake, &c., to wheat, and we see no reason why grasses should not be similarly affected.

ENHANCING THE VALUE OF A FARM.

An active and intelligent farmer, while he is raising good crops and getting a return from his fields equal to that of any of his neighbors, will also have an eye open to the permanent enhancement of the value of his fields. One means of doing this is to expend for years upon the premises a large portion if not the whole of his surplus earnings. Good buildings cannot be erected without a liberal expenditure of cash, but the investment is a safe one, and sure to pay. There is no danger to be apprehended from fraudulent issues of stock in such a concern; of peculations by dishonest agents; or the failure of reckless or unconscionable debtors. Fire is about the only enemy he has any cause to dread, and even this can be provided against by careful avoidance of all exposures, and an insurance in some safe company. Great care, however, is necessary to be observed in the selection of these, for an entanglement in the affairs of the innumerable fraudulent and bogus concerns of the present day, is more disastrous than a conflagration.

An extensive system of under-draining on many farms is of inestimable advantage, and there is rarely to be found a farm of any dimensions but that some portion of it can be improved in such a way. Safe depositories for manures, and cisterns for the liquid parts so as to prevent their running to waste, should form a portion of the fixed apparatus of the farm. Fields should be cleared of stone and these should be worked up into foundation or fence walls, so as to present no obstacle to the clean working of the plow share and the scythe. All these improvements cost money, and the beginner, who purchases is in debt for the premises on which he lives, must toil for years before he can realize such results; but time, patience, industry and economy, will work wonders, and with ordinary health and good management he will rarely fail of ultimate success.

There is one class of improvements, however, that requires scarcely anything but time to bring them to perfection. The agriculturist of the most limited income can easily put them in successful progress, and a few rapid rolling years will produce the results. This class of improvements is the cultivation of an extensive variety of fruit and shade trees. A man looks forward to the time when a tiny fruit tree is to come forward into bearing, and deems it a long, long time; perhaps he may never live to see it bringing forth its fruit, but the time rolls round before he is aware, and the luscious return is a thousand fold upon the cheap investment. Even seedling trees will in nine cases out of ten reward with fruit the hand that planted them, if he remain upon the farm to the end of his days; and if he do not, the enhanced value of the premises will be a permanent one.

How often do we see conspicuously inserted in the advertisement of a farm for sale, the following, or some other corresponding clause: "A superb and extensive variety of fruit;" and how many times does such a clause, if true, sell the place at an advance of five dollars on the acre? Even if the owner of a farm does not wish to sell, what can be more profitable for the market than a crop of fine fruit; or what afford to himself and his household an equal amount of physical enjoyment? Any farmer, with an amount of cost scarcely worth mentioning, can in a few years have an orchard and fruit garden such as we grieve to say are rarely to be met with even in our wealthy and successful agricultural community. The manipulations in the process of grafting and budding are easily learned, and with a single tree of each choice variety of the different fruits, the comparatively poor farmer can propagate them to any extent on stocks of his own raising.

We knew a farmer who prided himself on his agricultural skill, and who did in fact make money; and yet, after living near twenty years upon the place he occupied, scarcely a single fruit tree worthy of the name was to be found. He raised up a family to man's and woman's estate, without ever giving them the privilege of eating in peace, or in any other way, the fruit of his own apple tree; to say nothing of fig-trees and vines. And yet, this man would have deemed himself insulted if any one had accused him of improvidence. The farm has since been sold, for double its first purchase it is true, for that was at an early day; but it did not bring what its owner anticipated, nor what it would have done if a little foresight and a little care had been exercised fifteen years before in cultivating fruit, of which his own family might have had the benefit for at least ten years. Five years is amply sufficient to bring many transplanted trees into bearing, and the others would then be coming on from year to year.

Shade trees are of slower growth, but a few years will give even them a permanently useful as well as ornamental value, and add greatly to the attractiveness of a farm. How beautiful is the appearance of a fine old elm overhanging a fountain, or spreading its majestic branches as a cooling shade and summer shelter to cattle in the pastures? If the woodman in the destruction of the primeval forest did not here and there spare such a tree, the error should be at once corrected, by supplying those of as large dimensions as can conveniently be transplanted. Within a very few years, almost before we are aware, they will grow into noble and graceful trees, fit monuments in honor of the foresight and thrift of the man who planted them; the birds of the air will sing his praises amid their branches, and the panting flocks lie down beneath their cooling shade in grateful acknowledgment of his beneficence and mercy.

THRIFTY AND UNTHRIFTY FARMING.

The differences of men in regard to thrift, is made more palpable in agriculture than perhaps in any other human employment. The lands of the thriftless farmer, lying side by side with those of the man possessing opposite characteristics, forcibly suggests the close proximity of Paradise and Purgatory; or the remarkable location of sunny climes close by the regions of eternal frost.

Persons unacquainted with the circumstances, can scarcely be made to believe that Dame Nature has in the first instance dealt fairly between their fields. It seems as if the goddesses of fruits and flowers had emptied their cornucopias upon the former, and left the latter destitute. Different geological formations appear to lie side by side, the one without the necessary ingredients of soil for the food of plants, while the other is profuse in all the elements required. The knolls and hillocks of the thriftless farmer are brown and bare, and the fields of grain are deformed with patches of baldness where even weeds and thistles cannot grow; while in the vales, unsightly marshes and stagnant pools occupy all the inequalities. Famished vegetation and rank luxuriance, but the luxuriance of coarse grasses and swamp flags, frequently appear in the same field. The wash of the uplands denudes them by removing all the richness into the swamps below, to the injury and ruin of both.

The thrifty farmer, on the other hand, restores the equilibrium by manuring the uplands, and doubly supplying the knolls and hillocks with the essential food of plants; he drains the swamps and marshes, and supplants the natural crude grasses by more genial vegetation, until the whole farm, from valley to hill-top, smiles in the sunlight with an overburdened harvest. He chooses a judicious rotation of crops, and never exhausts his soil. Generous Nature seconds his efforts to enrich his fields, and even vegetable life itself extracts nourishment from the atmosphere, and elaborates it into solid substances for the benefit of man.

The unthrifty farmer builds his barn beside a running stream, or other similar locality, in order to rid himself easily of the offals and manure. His surplus hay (if he have any) is drawn off and sold from the farm; his wheat is threshed in the field, the straw burned up, and the ashes scattered to the winds; his implements of husbandry are left exposed in the field through rain and snow, and are guiltless of paint or other protection; his animals are houseless wanderers in the fields through summer's heat and winter's frost.

Unthriftiness is written like a blighting curse on everything, and pecuniary embarrassment, if not final ruin, closes his career. His farm, if ultimately sold, does not bring one-half the price of his neighbor's, and he charges to the lot of a hard fortune the legitimate fruits of his own misdoings.

The thrifty farmer clears up and keeps perpetually clean all his fields; he drains and manures, plows thoroughly and in season, and sows good seed; erects as fast as his income will allow, ample and substantial out-buildings; has an abundance of fruit trees early in bearing; obtains a large and varied supply of agricultural implements, and takes care of them when procured; does all his work in season, and cultivates no more land than he can do thoroughly; and the result is, he becomes rich while his unthrifty neighbor is becoming poor. He is blessed in basket and store, and is a living example of the benefits of good husbandry, both to himself and to the world.

THE MICHIGAN STATE FAIR.

The Sixth Annual Fair of the Michigan State Agricultural Society took place at Detroit, September 26 to 30. Owing to delays on the railroad we did not arrive till 4 o'clock on Thursday, just in time to hear the closing sentences of the address of Bela Hubbard, Esq. The speaker was contrasting the down-trodden *tenant* farms of England with the intelligent cultivators of their *own* land in this country, and drew a very interesting picture of the independent, useful and happy life of the American Farmer. We regret exceedingly that we were not in time to hear the whole of the address, which is spoken of in the highest terms.

The first thing to look at was, of course, the Durhams. They were much better represented in number and quality than we expected.—Silas Say, of Plymouth, Wayne Co., exhibited 8 head; a bull calf, and 3 of the cows pleased us much. A. Y. Moore, of Schoolcraft, also showed some excellent Durhams. We heard many speak of his cow as the best in Michigan. His yearling bull was particularly fine. Dr. Jeffry, of Dexter, showed a good heifer calf, as also did Judge Dexter, of Dexter, as well as a superior bull calf. Hiram Ansoll, Kalamazoo, showed a very fine 2 year old bull and a good cow. M. L. Brooks, of Northville, exhibited a 6 year old bull which we judge was second to none on the ground. (We have not seen the premium list.)

In Devons the show was particularly good, much better, we believe, than at any previous fair. E. M. Chipfen, of Coldwater, showed 20 head. He is now the owner of "Duke of Deron" and "Duchess," cuts of which were given in the Rural of April 15th. Wm. H. Mueller, of Moscow, showed 5 head of good animals. His bull calf was very good. H. Eggleston, Litchfield, J. W. Cumins, Paint Creek P. K. Leach, Utica, S. M. Bartlett, La Salle, and many others exhibited good Devons.

There was a large show of excellent horses, but the working oxen and fat cattle were not what we should expect from the great State of Michigan. The show of grades was good.—A. Y. Moore, of Schoolcraft, exhibited a very superior cow three-fourths Durham and the other quarter Deron and a little Holderness.—Mr. Comstock, Norwalk, Ohio, showed a fine 5 year old bull weighing 2,200 lbs., three-fourths Devon and one-fourth Durham.

In French and Spanish Merinos and their crosses the show was very extensive, embracing some excellent specimens of the best flocks in the Eastern States. Our space this week forbids particular notice. The show of Leicesters was much better than we expected. This breed appears to be well patronized in Michigan. There were few South Downs exhibited worthy the name. There were fewer swine than we should expect and none of surpassing excellence to make up for the deficiency. W. S. Lunt, Findley, Ohio, showed some of Fisher Hobbs' celebrated Essex hogs. They were almost *hairless* and, though fair, were not the *best* specimens of the breed we have seen.—There were a few good Suffolks, but the show of thorough-breds was on the whole quite small, while that of grades, principally of the Yorkshire, Leicestshire, and other large breeds was good in number and quality. The exhibition of Poultry was quite extensive and good, and, as usual, attracted many admirers.

The show of Implements and Machines was unusually good. Salmons celebrated "Grain and Seed Separator" was exhibited by T. W. Bell, of Ann Arbor. Of the innumerable machines of this character we know of none more *simple* and efficacious. C. M. McKenzie & Son, Adrian, exhibited Daniels' self-sharpening Straw and Stalk cutter—a very strong and superior machine. They also exhibited Parkers' Patent Straw and Stalk Cutter. H. H. Wheatley, Marietta, Ohio, exhibited Manrosser's Straw Cutter, which appeared to do its work well. In Field Cultivators the show was poor. We saw but one on the ground; an excellent implement, however, manufactured by P. A. Flower, Pontiac. It was very similar to Ide's, but had teeth back of the wheels so as to cut near fences, stumps &c. Ira Reynolds, of Republic, Ohio, exhibited an excellent plow with a self-sharpening steel point and wing. We saw but one Grain Drill on the ground, and that was rather a primitive concern. D. O. & W. S. Penfield, Hickok, exhibited a number of Sargent & Fosdick's Apple Parers, made at Sheburne Falls, Mass. They did the work well, and went off at $1,25 each, like hot cakes. Lord Elgin, the Governor General of Canada was on the ground and purchased one of them, observing that he would pare no more apples with a knife in the good, old-fashioned way. Hendricks & Co., of Plymouth, also exhibited one which not only pared, but cored and quartered the apple. They sold readily at $1,75.

The exhibition of fruit and vegetables was good. There were some very fine apples, grapes and pears, though the latter were generally not equal to the same varieties grown at the East. The Vicar of Winkfield, Colmar de Aremberg, Eastern Bourre and White Doyenne appeared to us rather small and scabby. On observing this to some friends they said that most of the best specimens had been removed. We hope this was the case.

The show of wheat, corn, oats, and timothy seed was small but of excellent quality. We observed some very fine Egyptian black barley, but could not ascertain the name of the exhibitor. Some very superior, well matured white beans and peas were also shown.

Cheese and butter were exhibited largely, most of the butter being of superior quality, but the cheese was generally quite hard, we suppose in consequence of excessive scalding.

On the whole the fair far exceeded our most sanguine expectations, and the agricultural capabilities of Michigan, and the intelligence and skill of Michigan farmers, have risen one hundred per cent in our estimation from our brief but agreeable visit to Detroit.

AGRICULTURAL FAIRS.

The Ontario County Fair, held at Canandaigua, Sept. 27th and 28th, was one of the finest local exhibitions ever held in this country. The Society had previously purchased six acres of land, beautifully situated, and improved the same for a permanent location. The grounds were well fenced and arranged,—altogether creditable to the Society, and worthy of imitation in other counties. The receipts from life members, annual members, and from individuals for admission on the days of the Fair, figure up, for the current year, the handsome amount of $3,104! We think this clearly entitles Ontario to the banner, for we doubt whether another county in the State, or Union, has done better.

Provincial Fair of Upper Canada.—The great Provincial Fair of Canada West, was held at London Sept. 26 to 30—the same days as the Detroit Fair. The exhibition was not quite equal to that of last year, but on the whole it was all that the friends of the Society could desire. An extended notice of it was crowded out this week, but will appear in our next number.

Rush Town Fair will be held at East Rush, in this county, on the 14th inst. A large and interesting gathering is anticipated.

The LeRoy Town Fair will be held on the 11th inst instead of the 10th, as published last week.

The Wheat Crop in England.—In a private letter just received from John B. Lawes, dated Rothamsted, Sept. 13, he says: "We have just gathered in a splendid harvest, all over Great Britain, and you may expect prices to rule very low in England next year. One acre which I set apart to ascertain the produce of my farm, yielded 53 bushels, and I think my whole wheat crop will average from 45 to 48 bushels per acre. The experimental crops have not yet been threshed, but they are very fine, and I think the produce in Broadbuck* will be higher than it has ever been before."

* *Broadback* is the name of the experimented wheat field. The fields in England are all designated by name, and if we mistake not *Broadback* is destined to hold a place in agricultural history. A crop of wheat is taken from it *every year*, the different plots being dressed with various fertilizing substances of known composition. The crop just harvested, and which Mr. Lawes thinks will be the best it has yet produced, is the eleventh.—Eds.

A Precocious Chicken.—I have a chicken of the Shanghai breed, about three months old, that is now taking care of four little chicks of the Brahma Pootra breed, now about a week old. I had a hen setting on Brahma eggs, and after she had been setting about two weeks, a friend of mine gave me four rather extra eggs, and I put them under the hen.—Soon four of the first eggs hatched, and I took the chicks away to the house and put them in a basket, and at night took this chicken, (a pet chicken,) and put it in the basket to keep them warm. The result is, that the said chicken takes care of the four junior chicks, broods them, and clucks to call them after her.—C. S., *Hector, N. Y.*

Multicole Rye.—As you do not know where Multicole Rye can be obtained, allow me to say, any one wishing to obtain seed can find it at the Buffalo Seed and Agricultural warehouse, Buffalo, N. Y. It is sold at $3,00 per bushel. The quantity is quite limited. w.

Horse Show in Vermont.—We learn from the *Brattleboro'* (Vt.) *Eagle*, that it is in contemplation among the members of the New England Agricultural Association, recently formed at Brattleboro,' to get a grand exhibition of New England horses, to take place upon the ample show grounds occupied several weeks since by the State Agricultural Society, for the annual Fair. The exhibition, if concluded on, will come off on the 17th, 18th and 19th of October next, and the reputation which Vermont has always sustained as a stock producing State, is security for its triumphant success.

One pair of pigs, according to Allnut, will increase in six years to one hundred and nine-teen thousand one hundred and sixty-nine—taking the increase at fourteen pigs per sum. A pair of sheep in the same time would be but sixty-four.

ADULTERATION OF MANURES.

Judging from a late article in the English Gardeners' Chronicle, as well as other writers, it appears that the English farmers are having their own troubles with the manufacturers and venders of superphosphates and other fertilizers. All the honesty at least does not appear to be centered on the other side of the water. The editor of the Chronicle says, "there was a time when cheating a Scotchman was about as difficult as cheating a Greek," but that they have sadly degenerated in this particular. In the transactions of the Highland Society, a Mr. G. William Hay, a distinguished agriculturist, gives a kind of autobiography of how he was victimized, which, for the benefit of our readers, we copy. A word to the wise is sufficient.

It appears that being desirous of trying experiments with various manures in the cultivation of turnips, he put himself in communication with a dealer in agricultural manures.—Among the substances he wished to employ were superphosphate of lime, nitrate of soda, phosphate of soda, sulphate of potash, sulphate of ammonia, nitrate of potash, phosphate magnesia, sulphate of magnesia, and muriate of ammonia. When the parcels came in he chemically examined, the nitrate of soda was found to contain only 56 pounds of that substance in every 100 pounds. The phosphate of soda just 6 pounds in the 100 pounds; the sulphate of potash 6¼ pounds; the sulphate of ammonia not quite 9¾ pounds; the nitrate of potash about 11¼ pounds; the phosphate of magnesia 2¾ lbs, and the muriate of ammonia 54 lbs. only. The superphosphate of lime (so called) contained only 4 per cent. of soluble phosphate of lime, the other 96 pounds consisted of water, gypsum, siliceous matter, some kind of free acid, and insoluble phosphate of lime, a perfectly useless substance. On complaint being made, the only satisfaction he got was, that they could not think of taking the rubbish back, as it was the *usual quantity* for agricultural purposes.

Mr. Hay also informs the public that in Scotland, animal charcoal is not what it ought to be, and that London night soil consists of the scrapings of the streets, with a little lime-stone mud and soil, and that gypsum contains 40 per cent. of sulphate of baryta.—*Penn. Farm Journal.*

OYSTER-SHELL LIME.

While spending a few hours on Staten Island lately, we saw a simple and efficient mode of making oyster-shell lime, which we record for the benefit of such of our readers as have the opportunity to put it into practice.

Mr. Dunning (for it is upon this gentleman's place that the thing is done,) builds up with rough stone walls, a circular kiln about five feet in diameter—just as you would stone up a well. A spot is selected on a side hill, where the slope of the ground is such that with a slight excavation the base of the kiln is exposed on the lower side. Here a small opening—a rude archway of 18 or 20 inches wide and a little more in height—is left as a sort of furnace—to be filled with faggots, brush, stumps of trees, and the like rubbish; to be had on almost every country place—over this furnace a few bars of iron are built into the wall, to hold up the first layer of oyster shells and a thin layer or sprinkling of the screenings of anthracite coal are put alternately, till the kiln is filled to the top—making in all a depth of some 4 to 6 feet. The fire is lighted among the faggots and rough wood below, and gradually spreads through the whole kiln—burning the oyster-shells into excellent lime. When we say that oyster shells make the purest and best lime for all horticultural purposes, and especially for fruit trees, and in most of our Atlantic towns they are wholly wasted, and tho' so easily burned in this way in these simple kilns, (which once made will last for a dozen years, (we think we offer a hint, which many subscribers will lose no time in profiting by.—*Horticulturist.*

Weeds and their Seeds.—If every farmer will look over his grounds he will find that the list of really troublesome weeds is quite small, although there are thousands of species of different plants, which might all become weeds. Why are they not all so? Simply because they have *no seed in the soil*. In some parts of the world, our weeds are entirely unknown. Why? They have not *the seed*. Now if other countries have not our weeds, should *we* have them, if we were only to rid ourselves of the seed? If only a fortieth part of our plants have been suffered to get in and drop their seed, and become troublesome weeds, why should we keep out thirty-nine fortieths, and let the other fraction over-run us? In China, and in some parts of Flanders, the fields are entirely free from weeds—the result of long-continued, plenty cultivation. If the French are not troubled with our red-root, why should not we try for the same exemption? If the English are unacquainted with our chess, why can we not enjoy the same privilege? If a county in Pennsylvania has never raised a plant of the Canada thistle, why may not all the counties in the Union become equally free?—They may—if they will only remember the aphorism, that "the price of this freedom is eternal vigilance."—*Country Gentleman.*

Coal Ashes.—A writer in the Practical Farmer gives his experience in the use of coal ashes. He says, I have now a bed of carrots, about two hundred feet long, and ten feet wide, in drills. The seed was sown unusually late, and I did not expect much of a crop. I had about a cartload of coal ashes—the result of the cooking stove—which had not been mixed in the manure heap; and not having any other use for them, I had them spread on one end of this piece of ground which I sowed with carrots. The ashes spread over about a third of the bed, and the carrots, where the ashes were spread, are more than twice as large as the other portions of the patch;—the stalks are much greener, and also double the size of the others. The whole piece was manured very lightly, as the manure yard was empty at the time.

ADMINISTERING MEDICINE TO HORSES.

The author almost invariably administers medicine in the form of drench, using a common champagne bottle. Some persons, however, assert that "there is great danger in drenching horses from a bottle; also, that it is very difficult to make them swallow fluid."—We never knew of any accident following the use of the bottle, where ordinary caution was observed. There is a space between the canine teeth and grinders where the bottle can be introduced; and if kept in that position while "drenching the horse," it cannot do any harm. Our usual plan is to stand on the right side of the horse, our back toward his body; we then take a firm hold of the lower jaw with the left hand, at the same time moderately elevating the head (not too high,) while with the right we gradually pour down the contents of the bottle. Time should be taken in the process; and if it is poured down in small quantities at a time, so much the better, the horse will be more likely to swallow it, especially if it be made palatable by the addition of a few caraway seeds or a little honey. Horses, like children, must be handled in the most gentle manner.

They will generally refuse to drink even a little gruel, when any unnecessary severity is resorted to in its administration. They may be coaxed, but not forced.

In answer to the second objection, we observe, that there is no more difficulty (not half so much) in administering a drench to a horse, under ordinary circumstances, than there is in giving a ball. To the latter we have great objections. First, in reference to its bulk; secondly, the length of time it takes for the gastric fluids to dissolve it; and lastly, its action is uncertain. Whereas, medicine given in the fluid form is readily taken up by the lacteals, and operates, for good or evil, in much less time. It has also been urged that, when a horse is suffering from disease of the respiratory organs, the additional excitement following the act of drenching is unfavorable to a cure. Unfortunately, we are in a worse predicament when a ball is given, for then the tongue is forcibly drawn out of the mouth, while the head is passed up to its root, where the ball is deposited. Our own experience in the matter leads us to decide in favor of the bottle. If any further proofs of its utility are wanting, we may mention the fact that one-half of our city horsemen are in the habit of administering drink from the bottle without accident.—*Modern Horse Doctor, by Dr. Dadd.*

APPLICATION OF MANURE.

A judicious and well-timed application of manure is a subject of great importance to the farmer. If he had a complete knowledge of the deficiency of the soil, and of the organized constituents of his manure, an economical application might be made with comparative ease. But it is not so, and he is compelled to study and experiment, until he becomes practically familiar with this part of his business, and better able to judge what quality is lacking, and what he has in store as a necessary supply.

A powerful fermenting process may be necessary to render a tenacious soil productive; one that shall drive the particles asunder, and "warm up the soil," as the saying is. The atmosphere plays a lively part in the production of all vegetables as well as animals. Hence the importance of cultivating the soil by plowing, hoeing, &c. Nitrogen in the form of ammonia or some other compound, escapes from fermenting substances. If the process is going on therefore in the soil, the nitrogen will unite or combine with some other substance supposed to be present, and thus form a nutriment for the plant. The escaping and expanding gases have much to do in such a case. They disintegrate the hard and adhesive lumps, and render them so porous, that the air has very free access.

Now if this manure had been applied to the surface, we can readily see that most of its power would have been lost, and its virtue too. So also, if fermented manure had been placed in such a soil, its effect would have been much less than the unfermented, because the former is composed mostly of the ashes of plants and mineral substances, of which the soil may have already a competent supply, and no new power be given by the addition of these comparatively inactive elements.

A different compost is necessary when the *seed*, and not the *stalk*, is the object of cultivation. The phosphates or phosphoric acid must be present for the formation and perfection of seeds, such as wheat, corn, &c., while for grass designed to be cut for hay, it may not be essential.

In the vegetable world, "like produces like," and the decay of plants produces food for the reproduction of the same plants, and if they decay upon the soil without loss, the present crop will furnish materials for a larger subsequent crop. Where the grape is cultivated in many places, the only manure used, year after year, is leaves and trimmings of the vines, carefully placed around the roots, and slightly covered to promote their decay.

If we place our corn cobs in a proper state of decay, upon our corn ground, we may perhaps gain more in the end, than we should to have them ground into meal,—or certainly than we should to throw them at random into the compost heap, to be applied without reference to a future crop.—*American News.*

A Princess turned Farmer.—Princess Murat has recently purchased a residence in the vicinity of Tallahasse, which she is improving and ornamenting according to her own taste. She lately sent to the editor of the Florida *Sentinel*, an Irish potatoe weighing 15 oz., as a sample of her crop. We rather suspect however, that this is over an average specimen. The princess Murat, our readers know, is widow of Achilo Murat, son of Marshal Murat, King Joachim, of Naples. She is a Virginia lady, daughter of the Hon. Bird Willis.—*N. O. Reg.*

To get rich, spend less than you earn.

THE POTATO.

Early lifting and storing of Potatoes is now considered the better plan since the prevalence of disease. They should be taken out as soon as the haulm or tops are dry and separate readily from the tubers, and put into small pits.—It is difficult to say why it is that Potatoes will not keep in large heaps or pits. Fifteen or twenty years ago, let the heaps be formed ever so large, not a word of complaint was heard. Is it the mode of pitting, or has a change come over the Potato itself? It must be the latter; then let us suit our practice to the change and make small pits, say 15 bushels each. We are much in favor of the practice of burying potatoes in the fields or in a yard kept for that purpose. In all cases the pits should be ventilated, for even a small pit will generate heat, and fermentation may take place if this is not attended to. Ventilators should extend from the *bottom* of the pit up, and project out a foot or more after the covering is completed for winter. Our plan of making ventilators is to take a couple of pieces of inch board three inches wide and the desired length—say five feet. Lay them down on edge and tack pieces of lath three inches long upon them, at intervals of 2 inches, as high as the potatoes will reach in the pit; then box up tight. These can be kept for 20 years, and one may be made in fifteen minutes if materials are at hand.—Place them upright and pile the potatoes around them. On dry land it is an excellent plan to sink the pit a couple of feet and roof with boards. In this case ventilators may be inserted in the gables. We have kept potatoes in this way in finer condition than by any other mode, and pitted them at less expense.

Years ago, old farmers would not store a potato damp; it was a fixed article in the creed that a dry day must be had for digging, and the potatoes must lay there basking in the scorching sunshine as long as possible; and then all hands must spring to and get them together before the dew fell. But this, like many other creeds has lost favor, and now the very reverse is the true philosophical way—that is, expose them as *little*—as short a time as possible, to the light and air. This latter mode certainly has most reason in it. The success of Col B. of Vermont, in raising this crop is well known—often lifting 800 bushels out of an acre of soil. When he gathered, his wagon stood in the field, covered with an old bed quilt, and the potatoes, as fast as dug, were put into it and kept covered. After the crop was stored in an out door cellar, ("root-house") he covered closely with turf or sods to exclude air and light. This was his uniform practice, and uniform success followed. In its native clime the potato remains in the earth during the winter, or the season of suspended animation. This practice is an attempt to imitate nature, and thus preserve the vigor and health of the tuber. We have no doubt as to the utility of it, and would like to see it adopted generally.—*Farmer's Companion.*

AMERICAN FARMERS IN PALESTINE.

Two years ago, an effort was made in a new line to ameliorate the condition of the inhabitants of Palestine. Seven Americans, with improved plows and other tools, and American seeds, located upon a piece of land seven miles from Jerusalem, one mile from Bethlehem, and made preparations for farming after the American system.

Their location was in the valley of Artus, upon the very site of one of the gardens of Solomon.

Their friends in the city were much opposed to their going out there to reside, urging them, if they were determined to try to cultivate the soil, to keep their residence in the city, for fear of the Arabs. This did not suit their plans, and they took up their residence upon the land and commenced operations, plowing deep with one of our best plows, harrowing with an iron toothed harrow, such as was never seen there before, and planting corn, potatoes, beans, peas, oats, barley, wheat, and all sorts of garden vegetables; in short, making a perfect American garden.

The operations, instead of exciting the jealousy of the Arabs, aroused them to a state of surprise, and the news of what the Americans at Solomon's were doing, and the wonderful tools they were using, and how peaceable and quiet they were, never saying anything about their religion, flew on the wings of the wind, and visitors came to look and wonder, from far and near. The operations of the carpenter and blacksmith were not among the least sources of wonder. The rapid manner in which he heated his iron, and hammered it into just such shapes as he desired, was beyond the comprehension of the simple-minded people.

One day the farm received a visit from twenty-five Sheiks, who inspected all the tools and the way they were used, and the effect produced, and looked at the growing crops, so much beyond anything they had ever seen produced before, and then turned their heads together to consult upon the wonders they had witnessed. They made applications at once for several of their sons to serve as apprentices to learn American farming, and did not even object that they should be taught the principles of American religion; for surely, said they, it must be a good religion, as these are very good people, and God blesses their labor beyond any other in all Palestine.

One of the number was in our office a few days since, from whom we derived these facts. He speaks in most encouraging terms of the success of the agricultural project, and ultimately, by that means, of an influence upon the inhabitants, that will eventually result in great good. All that is wanted to make it a desirable country for the emigrants of Europe, is an increase of the present colony sufficient to form a nucleus or rallying point, and more extended operations, and a gradual drawing in of the resident population to adopt the same modes of producing the varied and profitable products of the soil.—*N. Y. Tribune.*

The better animals can be fed, and the more comfortable they can be kept, the more profitable they are—and all farmers work for profit.

Orchard and Garden.

GO PLANT A VINE.

Reader, go plant a vine!
Why should the virgin soil drink in the sun,
Why should his bleachings shine
On the bare earth with nought to rest upon?
Go plant a vine.

Dig deep the soil,
Let it behold thy morn and evening care,
Bend to thy toil
As though it were glad labor to prepare
To plant a vine.

Perhaps 'twill cling
Alas! too late, around a withered tree
And all its fragrance fling
On the ungrateful air full wearily;
Yet plant a vine.

No clusters may
Reward thy labor and thy toil arrayed,
Yet e'en a lamb may stray
In summer heats beneath its broad leaved shade;—
Go plant a vine.

Thou lovest thy fellow man?
Why tarry longer, for the sun will fail;
No philanthropic plan?
Up! up! it, hast thou nothing done as yet?
Go plant a vine.

And then, when night shall come,
Trellised 'mid stars, the Husbandman above
Thy vine shall carry home,
Transplanted to the garden of God's love;
Go plant a vine. | *Erie Gazette.*

ROOTS AND THEIR USES.

It is a mistaken idea to think of benefiting a tree of any size by the application of manure or any mulching material immediately around the trunk, for in fact it can furnish little if any nutriment to the roots—the small roots—which take up and convey its food to the tree. It is laid down as a rule that "the length of the roots which radiate on all sides from the base of the tree is about equal to the height of the tree itself—and not as we often hear it stated, only the length of the branches from tops." Over this large surface—twenty feet in diameter for a tree ten feet high—the small roots form a net-work of fibres, and to derive full benefit from manure, mulching or cultivation, somewhat more than this amount of space must be operated upon. This is only true, however, of trees which have been for sometime planted, and which have their roots fully established.

The *Country Gentleman* recently gave some facts which well illustrate this position. They occurred, we presume on the grounds of Mr. Thomas, one of the editors of that paper. He has a row of peach trees, standing on ground uncultivated the present year, and nearly covered with grass. These trees are about 8 or 9 feet high, and 2½ inches in diameter; two of these grow within two feet of a manure yard under which, their roots extend and receive nourishment, and although immediately surrounded at the foot of the trunk with dense turf, they have thrown out shoots the present dry season from 2 to 2½ feet in length. Another tree in the same row which stands seven feet from the yard, so that its roots must go nearly as far for nourishment as the height of the tree, has made a growth of eighteen inches—two-thirds as much as the others. The fourth tree in the row, stands 16 feet from the yard, and hence can receive no nourishment from it; its shoots consequently have grown but 3 or 4 inches. The trees are all about the same size, the manure having been placed there but recently.

This shows that the extremities of the roots do the work. Another experiment is related to show the small advantage of working close to the foot of the tree. Two peach trees, in the same orchard had the turf removed and the ground kept clear of grass in a circle about four feet in a diameter. They made a growth of only six inches, while those wholly surrounded by grass grew but 3 or 4 inches.

These and many other instances might be brought to show that the roots of trees are more extensive and more important than is generally supposed. To benefit a tree by cultivation one must dig deep and wide—must rather go beyond than keep within the circle over which the roots extend. The manure must be applied at some distance from the base of the tree—neither that or the mulching material are needed immediately around the trunk. Our own experiments have gone to show us this, and we have found trees to succeed far the best when their roots could reach some fertile or well cultivated soil, even if that immediately around the trunk was allowed to form undisturbed.—R.

PRUNING MELON VINES, ETC.

Having several times read of the advantages of pruning, or shortening, melon vines, I went into my garden more than once for the purpose of clipping mine. Arriving on the ground, however, and seeing the thriftiness of their growth, I could not prevail upon myself to disturb them, and comforted myself with the thought that I did not know how short to cut them. At length some of the plants "crossed my path," so that I must either cut them off or turn them aside. I chose the former, and accordingly clipped all the plants, (of one hill only, which stood near the walk,) leaving about two feet of vine on every side, from the centre of the hill. I have observed that nearly all the fruit of the musk melon, (and such were mine,) lies within that limit. I was surprised to see the immediate change in the fruit, which now suddenly increased both in size and quantity beyond all I had ever seen. I suppose the *rationale* to be this: that what would have been expended in the growth of the plant was employed in the production of fruit.

Tomatoes.—I have generally been in the practice of forwarding my tomato plants in the spring by artificial means. Last spring I used only self-sown plants, transplanting some and leaving others to grow where they came up. At the time of ripening I observed that those that were not removed ripened their fruit about a week earlier than those that had been transplanted. Is it always so? I have never observed it before. R.

Out West, Aug., 1854.

A Good Growth.—I have a climbing rose of this year's growth, called the Queen of the Prairie, that has grown 14 feet 6 inches; another called the Baltimore Belle, that measures 16 feet 3 inches; another, the Queen of Belgians, measures now (Sept 23) 17 feet 11 inches, all of this year's growth.—Amber Willson, *Marcellus, Onondaga Co.*

Monstrous Pippins.—Some fall pippins laid on our table by Chauncey Barber, of Henrietta, were the largest we ever saw—so large, indeed, that they have gone off rather mysteriously. Next time, bring some less *attractive*, if you please, Mr. B.

THE PRESERVATION OF FRUIT.

From the address of Hon. M. P. Wilder at the late meeting of the American Pomological Society, we extract the following seasonable remarks:

There is but one other topic to which I will advert,—*the preservation and ripening of fruit.*

Much progress has been made in this art within a few years, and important results have been attained. This principle has been settled that the ripening process can be controlled.—Autumnal fruits have been kept and exhibited the succeeding spring. We have seen the Seckel, Bartlett, and Louise bonne de Jersey pears, in perfection in January, and even later. The maturity of fruits depends on saccharine fermentation. This is followed by other fermentations, as the vinous and acetous. To prevent these, and preserve fruit in all its beauty, freshness, and flavor, the temperature must be uniform and kept below the degree at which the fermentation or the ripening process commences. Our remarks, like our experience, have special regard to the apple and the pear, though the principle is doubtless susceptible of a more extensive application. Fruits, designed to be kept for a considerable time, should be gathered with great care some days before the ripening process commences, especially summer pears. A summer pear ripened on the tree is generally inferior. In respect to the latter, Mr. Barry, Editor of the Horticulturist, has so aptly expressed my own sentiments, that I use his language. "The process of ripening on the tree, which is the natural one, seems to act upon the fruit for the benefit of the seed, as it tends to the formation of woody fibre and farina. When the fruit is removed from the tree, at the very commencement of ripening, and placed in a still atmosphere, the natural process seems to be commenced, and sugar and juice are elaborated instead of fibre and farina. Thus, pears which become mealy and rot at the core when left on the tree to ripen, become juicy, melting, and delicious when ripened in the house." Various fruit houses have been built both in this country and in Europe; and experience shows that their object can be obtained only by a perfect control of the temperature, moisture and light. Hence, they must be cool, with non-conducting walls, or with exterior and interior walls, or a room within a room. Thus the external atmosphere, which either starts the saccharine fermentation or conveys the agents which produce it, can be admitted or excluded at pleasure. It is possible, however, to preserve the temperature at so low a degree and for so long a time as to destroy, especially with some varieties of the pear, the vitality, and therefore all power ever to resume the ripening process. Experience proves that for the common varieties of the apple and pear, about forty degrees of Farenheit is the temperature best suited to hold this process in equilibrium.

The proper *maturing* of fruit thus preserved demands skill and science. Different varieties require different degrees of moisture and heat, according to the firmness of the skin, the texture of the flesh, and the natural activity of the juices. Thus, some varieties of the pear will ripen at a low temperature and in a comparatively dry atmosphere; while others, as the Easter Beurre, are improved by a warm and humid air.

Some varieties of the pear, ripening with difficulty, and formerly esteemed only second rate, are now pronounced of excellent quality, because the art of maturing them is better understood.

But so many experiments have been tried, or are in progress, and so much has been written on this branch of our subject, that I need not enlarge except to say that the art of preserving and ripening fruit in perfection, involves so much scientific knowledge as to require great attention and care; and, until its laws are more fully developed, must be attended with considerable difficulty. I therefore commend it to your special attention, as second in importance only to the raising of new varieties.

SEASONABLE HINTS.

Lettuce.—The best way in which ears lettuce can be raised in this country, is by sowing the seed toward the end of September, and protecting the young plants during winter by shutters or some other contrivance similar.—As soon as the plants are large enough to handle, they should be pricked out pretty thickly into their winter quarters. As soon as the frost breaks up in the spring, they should be planted out in a warm spot, well spaded and manured—about one foot apart each way. The yellow seeded *Brown Dutch*, and the *Hammersmith*, are the best and hardiest.

Cabbage, for spring use, should be sown the third week in September, and protected similar to Lettuce. *Early Nonpareil, Early Yorauck* and *Early Battersea*, are all handy and good plants.

Herbs.—Before it gets too late, various kinds of herbs likely to be wanted for use during winter should be cut, and tied in small bunches, and hung up in some dry room or cellar. A very good way is to dry them crisp, using only the leaves, and put them away in bottles tightly corked.

Parsley keeps well this way, and retains its flavor. But as nice double parsley is a very pretty object while growing, and as it is some satisfaction to pluck it from day to day as wanted, a barrel or half barrel should be procured, by boring holes at regular intervals all down its side, and towards the end of this month, the parsley roots taken up and placed, one crown opposite each hole, beginning at the bottom first, and filling up with some porous soil to the top.—Edgar Sanders, *in Country Gentleman.*

FALL AND SPRING TRANSPLANTING.

A correspondent objects to the practice of those "who still continue in the old delusion that fall is the best time for transplanting trees"—stating that "some shrubs, and almost all plants, removed in the fall, when the *sap* the great supporter of their life, has gone into, their roots, vegetation ceases in them, and they, consigned to a new cold soil, perhaps not a single fibre of the roots taking hold until spring, if, indeed, detached almost, if not entirely, from all nourishment, my life remains, are destroyed by full transportation. Fruit trees, being more hardy, bear up, but they are forever stricken," &c. In the spring, "if the dirt is wet, and packed solid round the roots, before they are dug, touching or injuring as few of the fibres and roots as possible, and carefully setting in their new bed, vegetation goes on," &c.

We give this quotation for the sake of pointing out a very common error, namely, that the sap goes down into the roots to winter. Instead of this, the sap usually pervades all parts of a tree alike, and while covered with leaves, these keep up a constant drain or escape.—When the leaves fall, although vegetation has ceased, the roots still absorb a small quantity, and as there is no escape through the leaves, the vessels of the tree gradually become filled or distended, so that on the approach of warm weather, stimulating activity, the least wound is followed by a flow of the sap. As soon as the new leaves expand, as a general rule, this flow from incisions ceases, in consequence of the drain afforded in another direction.

Now it usually happens that removing the tree in the spring, cuts off in a measure the supply from the roots at the very moment it is most wanted,—an evil quite as great as that resulting from any diminished supply in consequence of fall planting. Our correspondent speaks of the evils of "a new cold soil"—are we to understand from this that the plant has warmed the bed in which it stood, and that it is chilled, like a human being, by removal to a fresh bed? Is not the "new soil" as relatively cold in spring as in autumn? He speaks of life being "destroyed by transportation"—this must refer to long distances; yet trees may be sent thousands of miles if *well packed*, with nearly or quite the safety attending their removal to the next farm. Ample experience has proved this to be true. Why are we not allowed to take the same pains in saving the roots and carrying the earth upon them, for autumn as well as spring transplanting?

But throwing theory aside,—we have in the course of our practice set out many ten thousands of trees of various sizes, both in autumn and in spring, and we are satisfied that more, by at least twenty-fold, depends on good soil, careful work, and especially on the subsequent culture, than on the season of the year; nevertheless, if it were not for the liability to be thrown out or raised by frost, and the danger to half tender sorts from the cold of winter, we think the advantages would decidedly preponderate in favor of autumn, more especially because it is not accompanied with the check we have already spoken of, at the very moment the trees should commence to grow rigorously. We have never found hardy trees to succeed better, if as well, *other things being the same*, as when carefully dug up in autumn and well laid in till spring, when they are set out, without the above mentioned check.

Shrubs and small plants, if inclining to be tender, are always made more tender the first winter by transplanting; hence they should be either protected, or the work done in spring. Hardy, early starting perennials, as peonies, pie-plant, &c., should always be set out in the fall; while tulips and many other bulbs require setting a month or two earlier. The practice must be modified by circumstances, climate, and the habits of the various plants.—*Country Gentleman.*

Flack's Imperial is one of the most prolific peas in cultivation. It grows to a convenient height, and whether considered for private gardens, or for market supplies, it is one of the most valuable varieties which have been introduced of late years. Seed sown 5th of April, in bloom 20lb of June, and on the 12th of July the pods were quite full and ready for gathering.—*Cottage Gardener.*

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending Sept 19, 1854.

Henry W. Adams, New York, improvement in breech-loading fire-arms.

Elliot C. Badger, Warner, N. H., improvement in machines for dressing millstones.

Wm. Bloch, Alleghany, Pa., improvements in steam engines.

James C. Burnham, West Jefferson, Ohio, improvement in maize harvesters.

Charles J. Conrad, Lower Augusta Township, Pa., for method of sawing shingles.

John Davis, New Bedford, improvement in telegraphic keys.

Henry Eddy, North Bridgewater, Mass., improvement in bee hives.

Wm. G. Elliott, Ellsworth, Eng., improvement in making slugwaw.

Benj. Fulghum, Richmond, Ind., for sawing machines.

Wm. P. Goodmand and Sam'l Morris, Springtown, Ind., improved portable staging.

Thaddeus Hyatt, New York, improvement in vault lights.

James R. Napier, Glasgow, and Wm. J. M. Rankins, Govan, Scotland, improvement in air engines.

John W. Middleton, Philadelphia, for tidal or current hydraulic ram.

Wm. H. Morrison, Marion Co., Ind., for fire-arms.

Henry B. Myer, Buffalo, for model of converting the backs of car-seats into beds or lounges.

A. N. Newton, Richmond, Ind., for breech-loading fire-arms.

Isaac Pitman, Reading, Mass., improvement in rosin oil lamps.

Marvin Smith, New Haven, Conn., for improved water meter.

W. G. Stealing, Bridgeport, Conn., improvement in counting machines and machines for indicating motion.

John Tapley, Frankfort, Maine, improvement in pumps.

Wm. Thornley, Philadelphia, for improved safety washer for securing wheels to axles.

John J. Weeks, Buckram, N. Y., improvement in sausage stuffers.

Archibald Winter, Rondout, N. Y., improved machine for sawing firewood, &c.

Loren J. Wicks, New York, improved method of operating guide rollers and feed clamps in sawing machines.

Benj. F. Upton, Bath, Me., improved apparatus for polishing daguerreotype plates.

Abner Whiteley, Springfield, Ohio, improvement in grain and grass harvesters.

Wm. H. Akins and Joseph C. Burritt, Utica, N. Y., assignor to Wm. H. Akins, aforesaid, improvement in calendar clocks.

Edward L. Seymour, N. Y., assignor to Daniel Brown, of same place, improved gold separator.

John Williams, Hartford, Conn., assignor to F. Curtis & Co., of the same place, improvement in calendar clocks.

For the week ending Sept. 26, 1854,

N. Auhin, Albany, improvement in gas generators.

Forilice Beals, New Haven, improvement in fire-arms.

Edward Brown, Rindge, N. H., improvent in elastic goods.

Schuyler Briggs and John G. Talbot, Sloansville, N. Y., improved neck yoke.

Gardiner Chilson, Boston, improved hot air furnace.

Geo. Copeland, Danville, Me., improvement in clasps for horse harness.

Joseph A. Curwin, Newark, N. J., improvement in knitting machines.

John Dame, Portsmouth, N. H., for improved barrel and bow.

John Drarton, Buffalo, improvement in bedstead fastenings.

Alex. Hall, Laydsville, Ohio, improvement in electric clocks.

Wm. Graham and Lawrence McLaren, Philadelphia, improvement in railroad car seats.

Moses E. Halsey, New York, improvement in chair frames.

Aaron L. Hatfield, Lewisburg, Pa., improvement in machines for adding numbers.

Thomas Hankman and Albert Vose, Pittsfield, Vt., improvement in whiffletrees.

Henry Hockstrasser, Philadelphia, for improved machine for paging books.

J. F. Keeler, Cleveland, improvement in platform scales.

Charles R. Landman, New York, improved safety lamps.

John Baptiste Laville, Paris, France, improvement in machinery for felting hats or hat bodies. Patented in France, Aug. 17, 1852.

Paul Moody, Camden, N. J., improvement in connecting a series of car brakes.

Septimus Norris, Philadelphia, for improvement in running gear of locomotive engines.

Joseph Stockton, Warren Co., Ky., improvement in springs to the knives of straw-cutters.

John J. Weeks, Oyster Bay, improvement in harvesters of grain and grass.

Moses D. Wells, Morganstown, Va., improvement in washing machines.

Joel Wisner, Aurora, improvement in washing machines.

Arad Aldrich, Princeton, Mass., assignor to J. L. Cooper, Worcester, Mass., improvent for cutting irregular forms.

D. W. Gitchell, Rahway, N. J., assignor to J. C. Wagstaff, New York, improvement in uniting bats for making seamless felt garments.

Wm. P. McConnell, Washington, improvement in process for making illuminating gas from wood.

RE-ISSUE.

David Rarrkin, Augusta Co., Va., for method of applying water to compound buckets of flutter wheels.

FACTS FOR BUILDERS.

One fact is, that a square form secures more room with a given cost for outside walls, than any other rectangular figure. Great length, and little width may afford convenient rooms, but at an increased expense.

Another fact is, that ventilation is an essential in a human dwelling. No other consideration should exclude this. The halls, windows, and doors should be so situated with regard to each other, that a full draught of air can be secured, at any time, in the summer season, by day and by night, through the whole house.—The stories should also be sufficiently high to afford a sufficiency of air in all the rooms.—Nine feet is a good height for lower rooms, and eight for upper. Bed-rooms should also be larger than they commonly are. Great injury to health is the result of sleeping in small close apartments.

The third fact is, that a steep roof will not only shed rain and snow far better than a flat one, but will last immensely longer, at the same time that it secures increased room for chambers, or garret.

The fourth fact is, that a chimney in or near the centre of the building will aid to warm the whole house, while if built at one end or side the heat will be thrown out and lost.

The fifth fact is, that a door opening from the outside into any principal room, without the intervention of a hall or passage, costs much more than it saves, in the free ingress of air into it.

The sixth fact is, that the use of paint is the best economy, in the preservation it affords to all wood work.—*Prairie Farmer*

INTERESTING PROCESS IN MECHANICS.

The silvering of mirrors is performed in the following manner:

A sheet of tin foil, the size of the proposed mirror, is laid on a flat table, and rubbed over with a little mercury, until the latter to a certain degree amalgamates with the tin. A large quantity of mercury is then poured over it, the workmen having certain indications informing them whether the sheet is in a properly prepared state or not. When all is right, the edge of a sheet of paper or cloth is laid upon the edge of the mercury, and the glass is then slid gently along, pushing part of the quicksilver before it, and resting upon the remainder. When the plate is fairly laid on, the surface is entirely covered by heavy weights, for the purpose of expelling all the mercury except that which has combined with the tin foil, and in this state it is allowed to remain, the table having a slight inclination, until the mercury has drained off. In the case of large plates, this sometimes occupies a long time; and even after the glass has been lifted and set on edge, small quantities continue to ooze out. When the plate is lifted, the tin foil adheres to the back, and the mirror is formed.

A French gentleman has invented a mechanical apparatus, which, when fixed on the keel of a vessel, will denote accurately her speed. It is a kind of dial, fitted to the bottom of the ship, externally, which corresponds with a similar indication on board. It is about to be tried on an English steamer.

Domestic Economy.

BORAX WASHING RECIPE.

A number of new subscribers have requested us to republish the above recipe, which appeared in a former number. We have been waiting to give the results of some careful experiments which were being made in our own family, but which were broken off by sickness. Enough, however, was ascertained to convince us that there is really a great advantage in adding a small quantity of borax to common hard soap, previous to using it for washing. Our method is as follows:—To every pound of hard soap add from one-half to three-quarters of an ounce of common borax, with one quart of water. Put the water in any convenient vessel upon the stove, and the borax, somewhat pulverized, and then put in the soap cut up in thin pieces. Keep them hot—but not boiling—for two or three hours, or until the whole is well dissolved, and then set it aside to cool, when a solid mass will be formed. If the vessel is set upon the warm stove at night, the operation will be completed in the morning, though we think it better to stir the mass just before it is cooled.

The night before washing, rub the clothes where most soiled, with the soap, and soak in water till morning. This soap, which has been more than doubled in quantity, will go quite as far, bulk for bulk, as the original, thus saving at least one half. The boiling and washing are to be performed in the usual manner; but it will be found that the labor of rubbing is diminished three-fourths, while the usual caustic or eating effect of the soap, is greatly lessened; and the hands will retain a peculiarly soft and silky feeling, even after a large washing. The preparation is adapted to all kinds of fabrics, colored or uncolored, including flannels, and it is thought to increase their whiteness. By using this preparation, with the previous soaking over night, we have had sixteen dozen pieces finished early in the forenoon, when, by the old process, it would have been an "all day's job."—*Am. Agricult.*

Grape Jelly.—Pluck the grapes from the bunches, choosing only such as are perfectly sound and ripe. Scald them slightly by heating in a porcelain or brass kettle, and place them in a jelly-bag to drain, first crushing the skins to allow the juice to exude. To make the best jelly the bag should not be pressed, but the juice allowed to drain slowly without pressure. To one pint of the juice add a pint of white sugar, heat till dissolved and the mixture comes to a boil. Pour into tumblers, sealing them over with white paper smeared with white of egg, (which will make the paper stick to the glass,) and place them in the sun till made.

To Make Tracing Paper.—Mix six quarts by weight of the spirits of turpentine, one of rosin and one of boiled nut oil, and lay this on the paper with a brush or sponge. If the Canada balsam is employed as a substitute for the rosin, a finer quality of tracing paper is the result. The paper should be well dried before used.

For the Pig.—In chickens, mix a tablespoonful of sulphur with about 3 lbs. of meal, and feed every other day,—perhaps for a fortnight.

Educational.

[For Moore's Rural New-Yorker.]

"COMMON SCHOOLS."—WHY NOT BETTER APPRECIATED?

In my previous remarks on this subject, I referred mainly to the schools of *this part of the State*; but from the best information in my possession, I think I hazard little in saying that with more or less modification, they may apply with a considerable degree of propriety to other States, as well as other portions of this State. "*It* (the Common School) *does not teach them* (the students) *to think*," may be regarded as a general proposition, the exceptions being sufficient only to prove its general truth.

But is it true that all children love to think? No; but it is true that those who do not love to think care little about learning, and vice *versa*. It is rare to find a student who has been taught according to the *by rote* method, that does not "brighten up" and show a new life when anything is presented that calls his mental powers into action. An idea is a novelty to him, and when once his mind is awakened on a subject, it is rare that he does not wish to know more about it.

Yet there are some who do *not* love to think. I have found such. With these, new ideas have no inspiring influence. Theories and reasons have no charms for them. They choose to persevere in the old beaten track, fearing "novelties" and "innovations" in education as in other things, to those "who like them." The number of such, however, is comparatively small; and perhaps even these, had their early training been of the right kind, would have formed no exception to the general rule.

Knowledge, however, consists in the acquisition of ideas. If these have been acquired only by committing to memory what others have written, our knowledge is to us uncertain, and if not, we are at best only retailers of other men's thoughts. If, instead of this, we are taught *to think, to reason, to investigate*, our knowledge becomes positive, and may properly be called *our own*, even if others had learned the same before us. With the former kind of knowledge we must ever be referring to our authorities, for fear of blundering; with the latter, we proceed with certainty, because our knowledge is our own. We know it is true, and we can give the reason for it. This is practical knowledge.

It is one thing merely *to teach others*, and another thing to teach them *how to learn*, or *how to teach themselves*. The former may be done to a certain extent, by allowing the student to follow in the track of his author; the latter requires a patient and thorough investigation of "the why and the wherefore" of every subject, so that not only shall the knowledge he acquires become *his own*, but that he shall be able afterwards to preserve his own independent investigations. The student who has been thus trained, has laid a foundation on which he can raise his own superstructure; in other words, *he can educate himself*. He has *learned how to learn*.

This leads me to remark a difference that I have observed in schools professedly of the highest order. I will illustrate my meaning by living examples. I knew a school in the State of ———, claiming to be *one* of the first, if not the *very first*, in the State. The students were well instructed in the various branches, so far, at least, as related to the contents of the book studied—in other words, they were familiar with their author. They could quote their authority,—"chapter and verse"—their rule, for everything they said.—So far they had been thoroughly taught. But they had not yet learned *how to learn*; for when called on for reasons, they could give only the authority of their author. In the same part of the same State was another school, of more modest pretensions, in which, in addition to a training similar to that above, there was added a thorough investigation of every rule, principle, &c., contained in the subject of study. Nothing was taken upon the authority of an author, unless satisfactory reasons could be found. A text book was regarded as an instrument for directing the course of study, not as a law whose authority might not be questioned, and from which there was no appeal. The effect of this training was, that the students were furnished with reasons as well as authorities for their belief; and while the former class had *learned their subject*, the latter had learned also the theory: they had learned *how to learn*, and could now pursue an independent course of study—could *educate themselves*.

There was another difference in the character of the students of these two schools. The former were in some measure conceited, and vain of their arguments—the latter, independent but not presuming. The former had imbibed the notion that their Institution and inventions were a little in advance of everything else, and consequently were not willing to learn from those whom they considered below them; the latter would grasp at knowledge wherever they could find it.

From these examples the reader will learn my idea of a good school, and also discover a reason why "schools *in general* are not what they should be." H.

Out West, August, 1854.

NEW SCHOOL LAW OF CONNECTICUT.

The Norwich *Examiner* calls attention to the new School Law of the last Legislature, and gives a synopsis.

Its chief idea is the consolidation of all the school districts in a town into one,—abolishing both the district and school society system at one stroke. But instead of being compulsory, like the preceding act, this is left for the adoption of the towns, in town meeting assembled, under warrant of the selectmen. Next, all the powers necessary to establish, improve and perfect the schools of the district or town, are committed to them in their united capacity.—One board of officers is appointed to manage the schools and the whole school system—aside from the clerk, treasurer and collector—instead of their being in the hands of three sets of officers, who are liable under the old law, both to fail of being co-workers together, and often to embarrass each other. This is also to be a permanent board, or one-third of their number is to be chosen annually; which is an admirable feature of their organization. They do all the work of all the three classes of officers—the society committee, the district committee and the board of visitors, appointing or calling to their aid, if they wish, the best men in the town to examine teachers and visit schools. It is not necessary, in this place, to enumerate their separate powers, or the various duties assigned them. A fixed and uniform day is named, when all such consolidated districts shall hold their annual meetings. New sites for school-houses are to be fixed by a two-thirds vote of the district or town, or at their request, by the board of education, who are the committee of the district. The deficiency in State, and town and interest funds appropriated for each year in supporting the schools, is to be made up by the usual rate bill wholly, or by taxation on the polls, and rateable estate of the town wholly, or partly by rate bill, and partly by such tax as the town or district shall direct. These are the principal new features of the law, and several of its sections are specified as still in force.

VENTILATION.

We were very much surprised to find that the ventilating apparatus which had been introduced into some of the most modern and expensive Boston school-houses, has proved an entire failure. It has been found that ventilating flues, placed in the outside walls, unless they are heated by the furnace, are never of any use. The only exception to this rule is in the case of flues placed on the south side of a building, the air of which sometimes becomes sufficiently heated by the sun to produce an upward current. Even flues placed in the inner walls, which are connected with the furnace pipes, operate very irregularly. In damp, muggy days, when the air outside and inside is nearly in equilibrium, they do not work at all. They therefore fail just when most needed. It is well enough to open such flues for occasional use. But they cannot be relied upon. The only sure method is to run the smoke-pipe from the furnace through the ventilating flue. The heat from the pipe will warm the air in the flue and produce a powerful upward current. A slow fire of coal screenings made in the summer season, sufficient to heat the pipe slightly, will secure a constant change of air, and will create a breeze far more grateful than that of the huge fans of the Persian boudoir.

Two openings are made into the ventilating flues from the school-room, one near the floor, the other near the ceiling. In the winter the unbreathed air as it comes from the furnace, is hotter than that which comes from the lungs. Of course it rises at once to the ceiling. Now if the ventilator be opened, as it often is, at the *top* of the room, the effect is to take off the warmest and best air, while the cold and foul air remains near the floor. If, however, the ventilator near the floor be opened, a strong current is at once established, which carries off the foul air as fast as it is created. In the summer the air from the lungs is warmer than the air of the room. Then if the upper ventilator be opened the foul air will pass off at the top. The design is to supply to each person four cubic feet of fresh air per minute. If the flue is heated, it is estimated that a flue fifteen inches square will suffice for fifty scholars.—*Examiner*.

Filial Affection.—A good father is ever humane, tender, and affectionate to his children; he treats them, therefore, with lenity and kindness, corrects them with prudence, rebukes with temperance, and chastises with reluctance. He never suffers his indulgence to degenerate into weakness, nor his affections to be biased by partiality. As he rejoices in their joy, and participates in their afflictions, he never suffers them to want a blessing which he can bestow, or lament an evil which he can prevent.—Whilst he continueth with them he administers to their present happiness, and provides for their future felicity when he shall be removed from them. He is doubly cautious in preserving his own character, because theirs depend upon it. He is prudent, therefore, that they may be happy; industrious, that they may be rich; good and virtuous, that they may be respected; he instructs by his life, and teaches by his example; and, after having done everything in his power to make them happy here, he points out to them the means of securing eternal bliss hereafter.

He who knows the world will not be too bashful, and he who knows himself will never be impudent.

HON. CHARLES MASON.

The accompanying cut is a correct likeness, taken from a Daguerreotype, of the Hon. Charles Mason, Commissioner of Patents at Washington. Mr. Mason is a native of this State, being born in Onondaga county. He graduated at the West Point Military Academy in 1829, and subsequently studied and practiced law at Newburgh, on the Hudson river, whence he went to New York as associate editor in the office of Mr. Bryant's paper, the *Evening Post*.

Leaving New York for a new field of enterprise then just opening in the West, he removed to Iowa, and, in 1838 received the appointment of Chief Justice of that territory; which office he filled with great wisdom and ability for the period of ten years. He was appointed to the office of Commissioner of Patents by the present Chief Magistrate, President Pierce, which office he has continued to fill up to the present time, with marked ability and success.

A correspondent of the Pennsylvanian thus describes his personal appearance:—"In person, Judge Mason is tall and erect, with strong, thick, brown hair, a countenance highly expressive of rapid and energetic thought, cheerfulness, benevolence, and lofty feelings; his frame indicates considerable power of physical endurance; his carriage is easy and graceful, and his whole appearance at once prepossessing and calculated to inspire feelings of respect.—In his conversation he is frank, plain, concise and methodical, seeming always to be self-possessed, and seldom hesitating in a reply. His perceptions are remarkably quick, and, like Mr. Calhoun, he seems to come to conclusions almost instinctively. I have heard many persons here speak of him, and all accord to him great powers of perception, quick, close, and powerful reasoning faculties, and all that sanity and genuine good breeding which usually mark the accomplished soldier and scholar.—In short, no one can be in company with Judge Mason, even for a few minutes, without being fully satisfied that he is a man of exalted mind and character."

GEORGE WASHINGTON.

His published correspondence is a revelation of the highest virtue and the greatest capacity for the several stations which he filled. He was in all things honest and just, truthful and dignified, liberal and modest, courteous and gentlemanly; and hence the good opinion which all true men everywhere felt for George Washington when he was alive, and which they retain now that he is no more. The following letter is a model one for the example it gives of the true mode of living at home; and we need such examples from just such high authority in these days of extravagance, folly, and selfishness. The letter we copy is now for the first time published, and was written to Tobias Lear, in England, in 1794. Washington gives the following reasons why he has empowered Mr. Lear to sell a portion of his landed estate:

"I have no scruple in disclosing to you that my motives to these sales are to reduce my income, more or less, to specialities—that the remainder of my days may therefore be more tranquil and free from care, and that I may be enabled, knowing what my dependence is, to do as much good as my resources will admit; for although in the estimation of the world I possess a good and clear estate, yet so unproductive is it that I am oftentimes ashamed to refuse aid which I cannot afford unless I sell part of it to answer this purpose. Besides these, I have another motive which makes me earnestly wish for these things—it is indeed more powerful than all the rest—namely, to liberate a certain species of property which I possess, very repugnantly to my own feelings, but which imperious necessity compels until I can substitute some other expedient by which expenses not in my power to avoid (however well disposed I may be to do it) can be defrayed."

No one, after this disclosure of Washington's financial system, can accuse him of parsimony. It evidences the same high integrity and thoughtful honesty which he displayed at the head of our armies and in the presidential chair.

Conceit.—Conceit is the most contemptible, and one of the most odious qualities in the world. It is vanity driven from all other shifts, and forced to appeal to itself for admiration.—Conceit may be deemed a restless, overweening, petty, obtrusive delight in our qualifications, without any reference to their real value, or the approbation of others, merely because they are ours, and for no other reason whatever. It is the extreme of selfishness and folly. —*Hazlitt*.

What you must do, do cheerfully and graciously.

THIRST IN THE ARCTIC REGION.

The use of snow when persons are thirsty does not by any means allay the insatiable desire for water; on the contrary, it appears to be increased in proportion to the quantity used, and the frequency with which it is put into the mouth. For example, a person walking along feels intensely thirsty, and he looks at his feet with covetous eyes; but his good sense and firm resolution are not to be overcome so easily, and he withdraws the open hand that was to grasp the delicious morsel and convey it into his parching mouth. He has several miles of a journey to accomplish, and his thirst is every moment increasing; he is perspiring profusely, and feels quite hot and oppressive. At length his good resolutions stagger, and he partakes of the smallest particle, which produces the most exhilarating effect; in less than ten minutes he tastes again and again, always increasing the quantity; and in half an hour he has a gum stick of condensed snow, which he masticates with avidity, and replaces with assiduity the moment that it is melted away.—But his thirst is not allayed in the slightest degree; he is as hot as ever, and still perspires; his mouth is in flames, and he is driven to the necessity of quenching them with snow, which adds fuel to the fire. The melting snow ceases to please the palate, and it feels like red hot coals, which, like a fire enter, he shifts about with his tongue, and swallows without the addition to saliva. He is in despair; but habit has taken the place of his reasoning faculties, and he moves on with languid steps, lamenting the severe fate which forces him to persist in a practice which in an unguarded moment he allowed to begin. I believe the true cause of such intense thirst is the extreme dryness of the air when the temperature is low.—*Southerland's Journal*.

There is something noble and heroic in that disposition which can dare to be singular in the cause of religion and morality, which, with a mind conscious of doing right, can fight single-handed the battles of the Lord against the host of scorners by which it may be surrounded. It is not a part of virtue to be indifferent to the opinion of others, except that opinion be opposed to the principles of truth and holiness; then it is the very height of virtue to act above it, and against it.

Speed of Lightning.—A wheel made to revolve with such velocity as to render its spokes invisible, is seen, when illuminated by a flash of lightning, for a moment, with every spoke distinct, as if at rest. The reason of this is, the flash has come and gone, before the wheel had time to make a perceptible advance.—*Plough, Loom and Anvil*.

Sunday Reading.

GOOD NIGHT.

Good night! a word so often said,
The heedless mind forgets its meaning;
'Tis only when some heart lies dead
On which our own was leaning,
We hear in maddening music roll,
That last "good night" along the soul.

Good night!—in tones that never die
It peals along the quickening ear;
And tender gales of memory
Forever waft it near,
When chilled the voice—O crush of pain!—
That ne'er shall breathe "good night" again.

Good night! it mocks us from the grave—
It overleaps that strong world's bound
From whence there flows no backward wave—
It calls from out the ground,
On every side, around, above,
"Good night," "good night," to life and love!

Good night! O, wherefore fades away
The light that lived in that dear word?
Why follows that good night no day?
Why are our souls so stirred?
O, rather say, dull brain, once more,
"Good night! thy time of toil is o'er!"

Good night!—now cometh gentle sleep,
And tears that fall like gentle rain.
Good night! O, holy, blest and deep,
The rest that follows pain!
How should we reach Heav'n's upper light
If life's long day had no "good night."

[*Chambers' Journal*.

[For Moore's Rural New-Yorker.]

THY WILL BE DONE.

Say not that life is dreary, and there's nothing bright below, for the sunlight of truth is shedding its radiance all around, and its bright beams kindle the hope that ere long shall be realized the desire of every pious heart. "Thy will be done." When prosperity shines on thy path, and joy and peace attend thy steps, be thou mindful of thy kind Benefactor, let benevolence be the life of thy soul, consider well the true source of human happiness, and with a heart swelling with pure devotion, and heavenly music, thou mayest exclaim, "Thy will be done," 'Tis not all of life to live, for he whose presence dispels the gloom of sorrowing hearts, and whose hands are ever open to scatter blessings in the pathway of the disconsolate widow, or the helpless orphan, has opened a fountain of unfailing joy, and is in possession of a treasure that will never fade.—Friends on earth he will not want, for gratitude he has awakened in kindred hearts, and ardent love and holy affection he shares from all around.

In blessing others he himself is blessed, and he experiences the truth of the divine record that "It is more blessed to give than receive."

But is affliction thy lot, do not repine, for it may prove as a furnace to refine thy heart. The Lord, in whose hand our breath is, and who seeth the end from the beginning, knoweth how to lead his chosen ones, and conduct them safely to those brighter realms above. Earth can yield no treasure that can satisfy the longings of an immortal mind. In poverty, faith may lay claim to an inheritance that is incorruptible, and that faileth not away. God is our Father, Jesus our Saviour, the Holy Spirit our Helper, and what can we want beside?—Heaven, with all its glory, opens to our view, saints and angels gladly welcome us to their heavenly home, and in triumph we exclaim, "Thy will be done." A. D. W.

Rochester, Sept., 1854.

THE SHEPHERD.

The only child of a father and mother who lived a godless life, was taken from them by death. They not only sorrowed as those who have no hope, but even expressed their displeasure at the visitation of God, and asked their pious minister why God, seeing he is here himself, had taken from them their only child. The man of God promised to give them answer in the funeral discourse, and he gave it in the following words:

"You wish to know from me, why God has taken your child from you. Well then he wished to have with him in heaven at least one of your family. You old people would not go in, and had he allowed your child to remain in this world, ye would not have allowed him to go in.

Hear, moreover, a parable. There was a good shepherd who had prepared choice food in his sheep-fold, but though he opened wide his door, the sheep would not enter. He labored long to drive them in, but they always turned back from the open door. He thereupon took a lamb and carried it before, when the old ones speedily followed.

"The good shepherd is Christ, the open door is heaven, the lamb your child. If you have the heart of parents, run after it! The Lord carries the lamb before, in order that the sheep may follow! Amen!"

Penalties of Eminence.—The price of immortality is death; the penalty of superiority is pain. We must wrestle for every victory, without always being sure that we shall have fair play. There are thousands in the world who would pluck the plumage of another without ever dreaming of wearing it themselves.—To rise into command of triumph is equally beyond their imagination and their hope; but there is a pleasure unspeakable which they enjoy in pulling down their neighbors to their own level.

Miscellaneous.

[Written for Moore's Rural New-Yorker.]

THE COUNTRY.

BY G. J. CLARKE.

Adieu, the city's noise and care!
We'll seek the low'ring hills,
Where Nature's music haunts the air,
And joy each spirit fills!

Where soft and balmy breezes blow
And bear the breath of flowers;
Where silver streamlets gently flow
Through quiet woodland bowers.

We'll watch the sun when first he glides,
From morning's rosy hall,
When, at his glance, the day-star hides
Behind heaven's azure wall.

When moon's soft languor fills the sky,
In wildwood cool and dim,
Beside some rambling rill we'll lie,
And list its dreamy hymn.

When sunlight dies along the skies,
And to the west afar,
Mild shadows fill the day-god's eyes,
We'll rove 'neath love's sweet star.

Then let us leave the city's care,
And seek the low'ring hills,
Where Nature's music haunts the air,
And joy each spirit fills!

Oh, gladly there will pass each day!
The fairy-footed hours
Will lightly, gently glide away,
As seraphyns from the flowers.

[Written for Moore's Rural New-Yorker.]

THE FETE NAPOLEON AT STRASBOURG.

STRASBOURG, Aug. 22, 1854.

DEAR RURAL:—The *fete* of the Emperor, the loyal Frenchman's "*Fourth of July*," has just passed off, and I propose to give you an account of the manner in which it was celebrated in this famous city of Strasbourg.—Long before the day arrived, preparations were in progress. As early as the 4th of the month a circular was issued by the minister of religion and of public instruction, addressed to the Archbishops and Bishops, providing for the religious part of the ceremonies, and, at the same time, one from the minister of the interior to the prefects of the various departments, respecting other arrangements. Since then, hardly a day has passed, without bringing some additional document, a proclamation from the Mayor, of particular regulations for preserving order during the day, an announcement of the organization of a pleasure train for Paris, or a programme setting forth the different modes in which the public joy was to be testified. This national *fete* has long existed in France, but the day for its celebration has changed with the successive sovereigns who have occupied the throne, being always that of the patron Saint of the monarch. For example, under Louis XVIIIth it was the 25th of August, this being the day of St. Ludovicus; under CHARLES Xth it was the fourth of November, the day in which good Catholics venerate the memory of St. Charles, &c., NAPOLEON the 1st, not being named after any Saint in the calendar, was obliged to make his own selection, and accordingly chose the 15th of Aug., which was his birthday, and already set apart by the Catholic church to celebrate the assumption of the Virgin. His nephew follows in the foot-steps of his illustrious uncle in this, as well as many other particulars, and his *fete* is therefore placed on the 15th of August.

The day was ushered in, if we are to believe the papers, by salvos of artillery, and the pealing of all the bells. The bells I can vouch for, but I did not go to *see* the cannons fired, and it would have required a *critic's ear* to hear them at any distance. During the morning, between four and five thousand loaves of bread were distributed to the poor, and at 9 o'clock the religious exercises in the different churches commenced, and continued till noon. They consisted of the chanting of *Te Deums*, of prayers for the Emperor and for the country, followed, in some instances, by the distribution of prizes to the children of the parish-schools. At 11 o'clock the official *Te Deum* was chanted in the Cathedral. Detachments of troops were present, and all the dignitaries of the city assisted in state dress. The Archbishops and Bishops were glittering in robes of crimson and cloth of gold, the members of the judiciary in black velvet gowns, bordered with ermine, and the Prefect of the Department of the Bas-Rhin, the Mayor of Strasbourg with his adjuncts, and other city officers, figured in coats richly adorned with silver embroidery. The procession was an imposing one, and the majestic strains of the *Te Deum*, pealing up through the lofty arches of the Cathedral, very impressive, but the preparations, the banners with which the walls were decorated, the presence of soldiers under arms, and the clang of martial music with which they were ushered into the church, seemed strangely out of keeping with the quiet and decorum which should characterize a place of worship.

At 12 o'clock the review commenced on the *place Kleber*, a fine, large square near the centre of the city, expressly appropriated to military displays, and adorned with the statue of the famous General from whom it is named. The review lasted about an hour and a half. The number of troops upon the ground was large, and their appearance fine. They were first drawn up in lines around three sides of the square, and after the General of the division had reviewed them to his satisfaction, riding for this purpose leisurely back and forth between the ranks, attended by his staff, they defiled before him by companies, and marched off to their quarters. Several of the companies were followed by a *cantiniere*, fancifully attired, and having a miniature cask of liquor suspended at her side, as a symbol of her profession. While looking at them a new idea suddenly dawned upon my mind, which I hasten, dear RURAL, to impart to you. The Bloomer costume, which has been so long regarded as the invention of Mrs AMELIA BLOOMER, or some other "strong-minded woman," is nothing but a copy, more or less accurate, of the dress of a French *cantiniere*. There are the same short petticoats, the same full trowsers, and, to crown all, the hat, a slight modification of a gentleman's beaver, set jauntily on one side of the head. Let Bloomers beware of making their appearance in France, for they would be in great danger of being regarded as wandering *cantinieres*, and would quite probably be arrested and placed in safe keeping till their regiment should appear to claim them.

But to return to the review. The troops finished defiling, the last company being the *Sappers*, with their heads buried in immense bear-skin cups, and an apron of white buck-skin reaching nearly to their feet, and the place was left clear for the artillery, which plays no unimportant part in a town so strongly fortified as Strasbourg. A long train of it soon made its appearance, the horses dragging the heavy cannon at a brisk trot,—they passed once around the square, and the review was finished.

At 3 o'clock feats were performed by the boatmen upon a space in the canal enclosed for the purpose. The favorite trial of skill and strength was this. Two boats, at a given signal, advanced towards each other from opposite directions, being rowed by an equal number of boys, dressed in white, with red sashes. In the prow of each stood a boy, holding a small banner, and in the stern a man armed with a long pole. As the boats passed each other these men brought their poles to a horizontal position, and each, placing the end of his weapon against the breast of his antagonist, sought to push him backwards into the water. This was not ordinarily very difficult, for the instant the balance was lost the man must fall; the swift motion of the boat, and his position at the extreme end, preventing his recovering the ground he had lost. Frequently both combatants went into the water at once, sometimes one would succeed in throwing his opponent over backwards without falling himself, and at other times, by dexterously slipping the end of his antagonist's pole off his breast, he would cause him to plunge forward into the water by the force of his own impetus. This sport continued until all the actors had taken at least one cold bath, the person who went through this operation last being considered the victor; and then followed some comic performances upon the water.

Later in the afternoon a fair of rural games was held at the Robertsau, a fine pleasure-ground, situated about a mile from the city, with which it is connected by a delightful promenade. Lest any of your readers should be misled by the word *fair*, I must explain that fairs in France are totally unlike what they are with us. No new inventions, no manufacturers or agricultural products are exhibited, but the whole display consists in ginger-bread and fruit-stands, in flying-horses and miniature railways, for children, and in petty lotteries and mountebank shows of every description, for children of a larger growth. In addition to the ordinary attractions, this fair was provided with two *greased poles*, which displayed a motley array of colored handkerchiefs, sausages, pipes, suspenders, and withal a watch, the rewards of the adventurous youth who should succeed in climbing their *slippery length*. Also, an orchestra, which performed at intervals for the peasants to dance, an exercise in which they engaged with right good will, notwithstanding the ground was wet and slippery from recent rains. The stout country boys, in their blue *blouses*, and the ruddy-cheeked, broad-shouldered lasses, whirled round in the mazes of the polka with an energy and evident enjoyment, that amply atoned for any lack of grace.

The ambitious aspirants for the honors of the pole were so many practical illustrations of the difficulty of attaining an *elevated* position in society, and the facility of the descent to the common level of humanity. Most of them, by mighty efforts, would succeed in reaching a certain height, where they would first become stationary, and then, after struggling a moment to retain their hold, slide down again with marvellous celerity. It was only by a plentiful use of *ashes*, rubbed upon the hands and arms, and also sprinkled upon the pole to remove its slippery coating, that one resolute boy of about twelve years succeeded in reaching the top of one of them, and detaching the watch as his prize. The ascent was now comparatively easy, and this pole was soon stripped of all its *pendants*. Meanwhile the other still remained unconquered. It was a little larger, or a little more slippery, than its companion, and the afternoon had nearly passed before repeated efforts, and, above all, a liberal use of *ashes*, finally overcame the difficulties which it presented.

In the evening there was a fine exhibition of fire-works, in an open area near the ground which the fair occupied. One of the most graceful pieces represented a serpent pursuing a butterfly. The form and undulating motion of the reptile, and the zig-zag movement of the insect were perfectly imitated. Another fine piece was the *facade* of a *chateau*, perfectly defined in lines of flame, surmounted by a medallion portrait of the Emperor, framed in jets of light, while underneath the motto, "*Vive l' Empereur!*" was traced in fiery characters.

All the public buildings in the city were decorated during the day, and illuminated at night. There was a great display of tri-colored banners, of eagles and of crowned N.'s. The spire of the Cathedral was also illuminated, but the effect was not very good, because the illumination was only partial, and did not mark the taper outline of this wonderful structure with sufficient precision. A boat illuminated and decorated, traversed the canal between the hours of 8 and 10, containing the choir attached to the theatre, who performed various pieces of music, while at intervals fire-works were discharged upon the water. A magnificent bouquet, composed of rockets of different colors, terminated the *fete*.

I could not but observe one point in which this national festivity differed from similar anniversaries in our own land. Brilliant it undoubtedly was, as only the French know how to make such an occasion, but it sadly lacked *spontaneity*. Everything down to the minutest particular of the arrangements, was regulated and cared for by the government, and individual or popular enthusiasm had nothing whatever to do with all these costly displays. My hostess, a staunch republican, as she pointed out to me the various object of interest, repeatedly exclaimed, "Oh! you should have seen a *fete* in the times of the Republic! It was a different thing from this. Now the only houses which are decorated are the public buildings, and those occupied by *employes* of the government, or by individuals who have received the cross of the Legion of Honor; then, every citizen exerted himself to contribute to the general rejoicing." Strasbourg is eminently republican in its character. Once a free and sovereign city of Germany, it still finds it difficult to bend its neck to the yoke, and many of its citizens religiously cherish the memory of the Republic, short-lived and imperfect though it was. M.

MISERY OF STATESMEN.

PROBABLY few great philosophic statesmen—few men, that is, who had acted intimately in public affairs as well as contemplated them from the closet—ever quitted the stage without a feeling of profound discouragement.—Whether successful or unsuccessful, as the world would deem them, a sense of sadness and disappointment seems to prevail over every other sentiment. They have attained so few of their objects—they have fallen so far short of their ideal—they have seen so much more than ordinary men of the dangers and difficulties of nations, and of the vices and meanness of public men. Not many Englishmen governed so long or so successfully as Sir Robert Peel, or set in such a halo of blessings and esteem; yet, shortly before his death, he confessed that what he had seen and heard in public life had left upon his mind a prevalent impression of gloom and grief. Who ever succeeded so splendidly as Washington? Who ever enjoyed to such a degree, and to the end, the confidence and gratitude of his country?—"Yet," says Guizot, "towards the close of his life, in the sweet and dignified retirement of Mount Vernon, something of lassitude and sadness hung about the mind of a man so serenely great—a feeling, indeed, most natural at the termination of a life spent in men's concerns. Power is a heavy burden, and mankind a hard task-master to him who struggles virtuously against their passions and their errors. Success itself cannot wipe out the sorrowful impressions which originate in the conflict, and the weariness contracted on the scene of action is prolonged even in the bosom of repose."—*North British Review.*

REFINEMENT.—Those who rail at poetry and refinement as superfluous ingredients in everyday happiness, little know what main props they seek to undermine. These will abide when even principles waver. Manly delicacy is as necessary in family life as manly rectitude; and womanly tact as womanly virtue. There is as much happiness wrecked from the absence of the one as from the absence of the other. Those who neglect the varnishes of life, commit an insidious sin toward themselves.

Good manners are the blossom of good sense, and it may be added, of good feeling too; for, if the law of kindness be written in the heart, it will lead to disinterestedness in little as well as in great things—that desire to oblige, and attention to the gratification of others, which is the foundation of good manners.

"LOST CHILD."

SINCE our early years, there has always been a vast meaning in the vocal proclamation of "Lost Child!" and troops of strange and mournful fancies have been called up by the accompanying bell-notes of the City Crier's dismal bass.

We think not so much of the anxious ones at home wondering and weeping that the child has wandered away, carrying with him many hearts; for the absent stroller will be doubtless soon restored.

There are other and many Lost Children in the great city, for whom no crier maketh utterance; whom no bell, were its reverberations full of thunder, could summon to the deserted household. Those Lost Children are indeed lost; they will not return with the morn of the morrow. The stars shall gleam through the dark tresses of Night, and the Day put on his golden crown countless times, and the lost will not be found.

Lost Children have hidden their forms in the cold earth; they went singing on their way and plucking blossoms, until Death gathered them from the sight and love of the bereaved.

But they are still singing and still culling blossoms—singing the songs of angels, and filling their bosoms with amaranths of blissfulness, in the azure fields of Heaven. And yet those that are left behind have not learned resignation nor the beautiful teachings of faith. They look up to the stars with eyes blinded by tears, and behold not the glory of the Apocalypse recorded in their sheen.

The wrung and riven spirits feel the dismalness of the "Lost Child" more keenly when some beloved being is dead and yet alive; when destiny has reared a barrier between two dear lores, and made sobs and prayers mere burthens of the wind. The sea of circumstance roars between them, and they will not take the plunge, though they perish on the shore.

There are other Lost Children, cruelly, fatally and desperately lost. Gifted sons that have drained the Circean cup, and taken the demon-goddess to their arms—fair, pure daughters, who have hearkened to the tempter's honied tongue, and fallen in a simple innocence through the strong weakness of woman's love.

These, O, these, are poor Lost Children that it beseemeth Charity to strengthen and goodness to assist. Their toils were firm and their errors only human.

The City Crier's trade would not serve for them who need no brazen throat to call them back to the abandoned hearth-stone. The low voice of affection and compassion may, lead them unto duty here again, and to the lost children, the amaranth gatherers, hereafter.

Cease thy clanging bell, then publisher of woe! There are no lost children; they will return to us or we to them when the stars shine brightest behind the darkest cloud.—*Cin. Times.*

WHAT A BOY CAN DO.

IN passing along one of our streets the other day, a little fellow fell in with an old salt, who was shivering, with three sheets in the wind.

"Ship ahoy!" hailed the tar—and the little chap hauled up alongside. "Where away may be the Seaman's Mansion?"

The lad proffered to show him, and they held along together—the sailor steering very wildly—sometimes hard up, as though he had struck a heavy sea, and then yawning off to the right or left, as the case might be.

"I am not exactly water-logged," said he, "but have too much of a deck load on—and top hamper is rather heavy for my ballast! eh, a little too much of the critter aboard—hick, you understand. Shun the rum, the *blue* rum, my little man, as you'd avoid old Timbertoes. Shiver my topsails! but it was the ruin of me. Here have I got a wife and little ones, one a youngster about the same tonnage as your-self, in Boston, and some property besides, but Satan has placed a barrier between us, in the shape of a can of grog. Shun the critter, my lad, as you'd shun a pestilence."

The lad promised to bear in mind his advice, and then asked him why he did not sign the temperance pledge.

"Where may that temperance pledge be found?" he inquired.

His young comrade informed him that there was to be a temperance meeting at the Exchange that evening, and offered to go with him if he would sign the pledge.

"What! a child urging me to sign the pledge? I'll go. Come in here, my little one, (by this time they had arrived at the Seaman's Mansion) and take some supper with me; as soon as we have got the ballast in, we'll haul up for this same temperance meeting. Stave in my bulwarks if we dont."

The little fellow stuck by him, and as soon as supper was over, went with him to the temperance meeting, where the old salt signed the pledge. As he did so he remarked that whenever he was tempted to drink, he would think of that little boy's care for his welfare.

We doubt not that warm hearted tar will keep the pledge so long as his timbers hold together. The next day he went to sea—not forgetting to call upon his juvenile friend before his departure, and be assured him he should seek his wife and family on his return. So much for the influence of a child.—*Life Boat.*

A POOR WOMAN'S GRATITUDE.—Mr. Gough in one of his orations before the British audience, related the following incident. We doubt whether from any of the beautiful and costly gifts, of which Mr. Gough has been made the recipient, from admirers of his genius and philanthophy, any one has more deeply touched his heart than this testimonial of the poor Edingurgh woman. Said he:

"While in Edinburgh, lately, a woman with two children called upon me, and, though very poor, insisted that I should accept a present of a white handkerchief, saying:—'While you wipe the sweat from your brow, when you are speaking in this cause, let it remind you that you have dried the tears of my house.'"

Ladies' Department.

CONDUCTED BY A——E.

WILT THOU LOVE HER STILL!

"WILT thou love her still, when the sunny curls
That over her bosom flow,
Will be laced with the silver threads of age,
And her step falls sad and low?
Will thou love her still, when the summer's smiles
On her lips no longer live?"
"I will love her still,
With right good will."
"Then will love her still? then our cherished one
'Tis thy sheltering arms we give."

"Wilt thou love her still, when her changeful eyes
Have grown dim with sorrow's rain;
When the bosom that beats against thine own
Throbs slow with the weight of pain;
When her silvery laugh rings out no more,
And vanished her youthful charms?"
"With free good will
I shall love her still."
"Then will love her still? then our dearest one
We give to thy loving arms."

"Remember, no grief has she ever known,
Her spirit is light and free;
None other, with fatherless step, has prest
Its innermost shades, but *thee!*
Then wilt love her still, when the tho'ts of youth
In their blushing bloom depart?"
"Through good and ill
I will love her still."
"Then will love her still? then our darling take
To the joy of thy noble heart."

"Remember, for thee does she smiling leave
The friends of her early days—
No longer to meet their approving looks,
Nor their fond unfeigned praise.
Forgive her then if the tears fall fast,
And promise to love her well."
"I will love her still
With right good will."
"Then will love her still? then with peaceful trust
We our sobbing sorrows quell."

"When her father is dead, and the emerald sod
Lies still on her mother's breast;
When her brother's voice is no longer heard,
And her sister's hushed to rest—
Will thou love her still? for lo *thee* she looks,
Her star on life's troubled sea."
"I will love her still
Through good and ill."
"With the marriage vow on her youthful lip,
Then, we give our child to thee."

GENTLE WORDS.

WHEN, far from the dear home of our childhood, we hear a kind good-night, or a gently expressed wish for our welfare, how fast come before us the memories of the past—memories that have perhaps been long buried in oblivion. Our early friends come circling around us like the spirits of dream-land, and the stranger-face becomes a talisman for good that none but one far from home can realize.

When sorrow overwhelms the soul—when bright hopes and joyous affections have been crushed beneath the Juggernaut car of oppression, even then will a pleasant countenance be mirrored in the stricken heart, and kind words find there an echoing chord.

Kind words!—they are the bright sunshine that through the tears of childhood form a bow of promise lovely as the first bow of heaven. They are a healing balm to the wounded spirit—they take from the dregs of life their bitterness, and soften the edge of rebuke, that its sting does not rankle in the soul. When the heart has been lacerated by the thorny ills met with in the proud world, how gentle words will soothe the irritated spirit! They come bearing on their wings perfumes from the flowers of friendship and love.

Give gentle words to the angry—for "a soft answer turneth away wrath." Gentle words to the timid, and the blessing will return to your own bosom tenfold. Kind words to the old—for surely they have endured enough of life's ills. Kind words to the young—cast not the shadow of a disconsolate spirit over their pathway—it will be dark enough at best. Kind words to the erring—the reproaches of guilt must be full hard enough to bear, and harsh words will never win them to the ways of truth. Speak gently to all; a smile is more precious than rubies, and costs nothing but what it amply repays. Kind words, welling up from the heart, like a spring of water on the hill-side, spread beauty around, nourishing that lovely flower, a meek and quiet spirit, from whose chalice acceptable incense arises to Divinity.—*Ladies' Wreath.*

PLEASURE.

BLESSED be the hand that prepares a pleasure for a child! for there is no saying when and where it may again bloom forth. Does not almost everybody remember some kind-hearted man who showed him a kindness in the quiet days of his childhood? The writer of this recollects himself at this moment as a bare-footed lad, standing at the wooden fence of a poor little garden in his native village; with longing eyes he gazed on the flowers which were blooming there quietly in the brightness of a Sunday morning. The possessor came forth from his little cottage—he was a wood-cutter by trade—and spent the whole week at work in the woods. He had come into his garden to gather flowers to put in his coat when he went to church. He saw the boy, and breaking off the most beautiful of his carnations—it was streaked with red and white—gave it to him. Neither the giver nor the receiver spoke a word; and with bounding steps the boy ran home; and now, here at a vast distance from that home, after so many events of so many years, the feelings of gratitude which agitated the breast of that boy expresses itself on paper. The carnation has long since withered, but now blooms afresh.—*Douglas Jerrold.*

Good qualities, like great abilities, are incomprehensible and inconceivable to such as are deprived of them.

MOORE'S RURAL NEW-YORKER

ROCHESTER, OCTOBER 7, 1854.

October and its Suggestions.

The Sun crossed the line a couple of weeks since, and has now fairly entered on his Southern declination. Equatorial shadows now fall towards the North, and for three months to come will lengthen day by day. The North pole is now merged in the darkness of a six months night, and the premonitory symptoms of coming winter are beginning to be experienced even here. On Friday evening (the 29th ult.,) there was quite a frost in this locality, and on the succeeding Sunday evening another, not quite so severe; but enough to tinge the herbage by a touch of its destroying finger, and suffuse the foliage with the first mellow tints of Autumn. Pomona is shaking down her golden treasures, and Ceres is gathering into the garner her later harvests.

The citizen is not unmindful of the coming winter, and along our sidewalks the dusty coal-heaver is dumping down his sooty "rocks," elaborated in some subterranean coal-pit into the best possible material for fuel. Thanks to the wise provisions of an over-ruling Providence, the screams of a former era in the worlds existence, have been stored up in exhaustless beds to meet the necessities of the present times. If it were not so, the earth would be denuded of her forests in half-a-dozen years, and human existence blotted out from whole countries which now sustain a dense and vigorous population.

The farmer, as he sits beside the wide-mouthed chimney which holds in its blazing throat the bright burning wood-fire, can hardly estimate the amount of fuel consumed by the inhabitants of a great city; by the millions of work-shops where steam engine and forge are laboring night and day; by the thousands of locomotives that go thundering over the plains in all directions; by the countless number of steamships that cross the ocean and ply along its shores, and by the innumerable other interests that in their processes must involve the intensity of fire. All this fuel must be supplied from vegetable sources, but the majority of it is in the form of coal, produced from the wreck of organic matter which grew upon the earth at a remote geological period.

The return of long evenings, and the cessation of farm labors which will soon ensue, afford leisure and opportunity for the young agriculturist to improve his mind and elevate his ideas. The dignity of his profession cannot be exalted too high, for on its success that of all other employments must depend. Cut off the supply of raw materials, and every cotton and woolen spindle must cease to hum, every mill wheel cease to rotate, every saw stop cutting, every canal boat and freight car halt in its transit, and every branch of human industry come to a stand still. Stop the food wherewith mankind replenishes the inner man, and gaunt spectral forms would gather at the corners of the streets, and perchance literally, as they do now figuratively, prey upon each other. Merchants would cease chaffering, lawyers wagging their tongues in court, doctors drop their pill bags, and editors their pens; at which point in the argument we will close the subject.

The Erie Canal Enlargement.

The Canal Board, sitting at Albany on the 28th ult, reversed the decision of the Board of 1850; and have decided to retain the old line of canal by the way of Pittsford. This is some six miles further than by the new route located on the straight line from Brighton to Fairport; but the change would work great local injury to the people of Pittsford, whatever advantage it might be to "the rest of mankind." Still, we are not sure but the saving of six miles of canal navigation to the great forwarding business of this State and the West, would not be sufficient to buy up all local interests, for the purpose of using them to fill up the old ditch. The new line as originally located from Albany to Buffalo, cuts off full thirty miles of windings and sinuosities.

Provisional Bishop of the N. Y. Diocese.—Dr. Horatio Potter, of Albany, was last week elected Provisional Bishop of the Episcopal Diocese of New York, in the place of the late Bishop Wainwright. The opposing candidates for the honors of the church were the Rev. Drs. Vinton, of Brooklyn, and Harcut, of New York, and nine ballotings were had before a choice was effected. The contest between the Bishop elect and Dr. Vinton, was a close one the latter representing the so-called High Church party. The Low Church party, which has thus proved itself the stronger, is perhaps the more Democratic of the two; but what the precise difference between them is, must be left to theologians to determine.

Indictment of a Mayor and Councilmen.—The Grand Jury of New York city last Saturday indicted the Mayor, Jacob A. Westervelt, and two members of the Common Council for granting licenses to aliens and other persons incompetent by law to hold licenses. The same Jury also indicted *one thousand one hundred and thirteen* persons for selling liquor without a license. Three cheers for that Grand Jury, we say!

Political Intelligence.

The Anti-Nebraska Fusion State Convention, assembled at Auburn on Tuesday of last week, adopted the Whig State Ticket out and out.—The Free Democratic Convention, assembled at the same place on the same day, nominated Clark, the Whig candidate, for Governor, and Bradford R. Wood, a Democrat, for Lieutenant Governor.

The Massachusetts Democratic Convention also met on the same day at Lowell, and nominated a State ticket with Judge Bishop at the head for Governor. A series of resolutions was reported amid much confusion, endorsing the Nebraska bill and all other measures of the Administration. A severe speech was made in opposition by O. M. Veazie, of Medford, but the resolutions were afterwards adopted without dissent, those opposed not voting either way. Judge Bishop, like Messrs. Bronson and Seymour of our own State, declined the nomination, but was placed at the head of the ticket notwithstanding.

Liberty Ticket.—The Liberty Party which held their State Convention at Auburn last week, nominated the following ticket: For Governor, Wm. Goodale, of New York; Lieut. Governor, Austin Wand, of Ourida; Canal Commissioner, John C. Hennington, of Oswego; State Prison Inspector, Wm. Shafcilt. This makes five distinct organizations in the field, with as many separate State tickets. The dear people have reason to be thankful that only one of the tickets can be elected, for if all the aspirants for office would get what they asked for, the seven plagues of Egypt would be light afflictions in comparison.

Western Railroad Convention.

A general Convention of the Railroads of the West was held recently at Columbus, Ohio. Like that of our own State, they abolished the system of employing runners and outside agents. In regard to the monstrous and unjust practice of *dead heading* so many persons generally from the class of men best able to pay their passage, the Convention provided:—"That after the 1st of January next, no free passes, or half passes, should be given to any person whatever, except to the officers and employees of the respective roads; and not even to the Presidents or Superintendents of adjoining roads; that fare should be exacted from employees of mails, except when traveling on the business of the road; that children under five years of age, accompanied by parents or guardians, should pass free; between five and twelve years, half price; that no half fare trains should be run, except to and from State Agricultural Fairs, but the local excursion trains might be run at the discretion of the Companies."

Wreck of a Steamer.

The fears expressed last week that the steamer City of Philadelphia might be wrecked, have proved true. She ran on the rocks off Cape Race, (New Foundland,) and, being got off in a sinking condition, she was run ashore seven miles distant, and sunk in three fathoms of water. Her crew and passengers are all safe, and the cargo, valued at $60,000, has been landed in a damaged condition. This is the fourth American Trans-Atlantic steamer lost within a few months, viz., the Humboldt, the City of Glasgow, the Franklin, and now the City of Philadelphia. Underwriters must groan over such a repetition of losses, which, if continued, will make a wreck of their fortunes.

Lands in Kansas.—It is a mistake which very generally prevails, that the United States will donate 160 acres of land to all actual settlers in Kansas and Nebraska. The two territories were united with New Mexico, in the title of the act "establishing the office of Surveyor General," &c., and lands in New Mexico were granted under certain conditions to actual settlers. In Nebraska and Kansas, Government *donates no land to settlers*, but allows each person to take up one hundred and sixty acres, provided he pays for the same at the rate of one dollar and a quarter per acre—ample time being granted for the earning of the amount, with ordinary industry and success, before it becomes due.

Ashland in Ruins.—The Ashland estate, Henry Clay's old home, is now in the possession of his son, who has razed the old house to its foundations, preparatory to erecting a new and more elegant structure upon its site. Much regret is expressed that such a course has been taken, the national reverence for a great man naturally attaching itself to the residence in which he lived and died. Still, no man has any just cause to complain of the present occupant of Ashland, as the title to estates cannot be tied up under the wise provisions of our law, and, consequently, any man has a right to do as he pleases with his own.

Kansas Emigration.—The fourth party for Kansas, under the auspices of the Emigrant Aid Association, left Boston last week. They numbered 86, and the *Atlas* estimates the party to reach the number of 200 before arriving at St. Louis. The next party will leave on or about the 20th inst.; and the New York Kansas League will also send a train from New York city, by way of Albany, on the 3d of October. The *Syracuse Journal* says that Gov. Reeder and a party of five hundred emigrants for Kansas, passed through that place a few days since.

The Sandwich Islands Treaty.

The Albany *Evening Journal*, on what it considers the best of authority, reaffirms the statement that there is now a treaty for the annexation of the Sandwich Islands to this country at Washington, awaiting the action of the United States Government, and gives the following as substantially the terms of the treaty:

"The Islands are to be at once admitted into the Union, *not as a Territory, but as a State*—with full State sovereign powers. In consideration of this surrender of their national sovereignty, the United States, besides agreeing to respect all existing charters, land titles, &c., are to pay some $300,000 or $400,000 annually, as life annuities to such persons as the sovereign authorities shall designate. It is believed that the number who will be declared entitled to share in this annuity, will not exceed thirty individuals, including the King, his two sons, and the members of the House of Nobles, all of whom are now rich, and constitute the great landholders of the kingdom. Their ages will average about 40 years, and the sum to be paid to each will cease to be a debt upon the United States Government at their death.

"Besides the sovereignty of the Islands, all the government property—including buildings, claims upon foreign governments, &c., will, it is understood, be transferred to the U. S. Government by this treaty. The value of these buildings alone is said to exceed $1,500,000, and the claims upon the French and British Governments to about $500,000 more; making an aggregate of $2,000,000."

Testimonials.

The Committee appointed by the New York merchants to arrange and determine the matter of testimonials to certain officers and seamen, for meritorious conduct in saving the lives of persons wrecked at sea, made the following awards last week:

Steamship Washington.

Capt. Finch, $760 and an appropriate Gold Medal. Mr. King, Chief Officer, whose conduct on the occasion of the rescue of near 400 lives from the wreck of the Winchester was deserving of the highest praise, $500 and a Gold Watch. Second and Third Officers, each $100 and Silver Medals. To each of the four men composing the crew of the first boat to the wreck, $50.

Ship Germanic.

Capt. Foster, $500 and Gold Medal. First Officer $100 and Silver Medal. Second Officer $50 and Silver Medal.

Ship Union.

Capt. Young $350 and Gold Medal. First Officer $100 and Silver Medal. Second Officer $50 and Silver Medal.

Ship Monmouth.

Captain Ludlow, $250.

British Brig Carolina.

Gold Medal to Captain of Brig Carolina.

Irish Good Intent.

Gold Medal to Captain of Brig Good Intent.

State Fair Ground.

We copy from the *New York Tribune* the following description of the ground on which the State Fair is being held:

"The square is bounded on the north by Sixty-ninth st.; east by Third av.; west by Fourth av., through which runs the Harlaer Railroad, and where all the trains will discharge passengers close by the gates of the show ground.—The Third av. cars discharge passengers at the gate on the other side.

"The square, it is said, contains eighteen acres. It is fenced with a tight high board fence, 872 feet long on the north and south sides, and 1,133 feet on the east and west sides. The principal offices and entrance gates are on the south side. Private carriages will mostly approach by Fifth av. and Seventy-first st., to the north entrance gate, close by the little church. There will be ample standing-room for carriages, and officers to keep order. There is no carriage-room inside the inclosure, except for teams entered to compete for the prizes in the show ring."

New Route to New York.—The cars on the Genesee Valley Railroad commenced running on Monday last; two passenger and one freight train, going through daily. This opens a new route by a broad gauge road to New York from this city, so that people can have their choice of two independent lines of road, either east or west,—an event which has been long and anxiously looked for. Success to the Valley Road, and may its cars never prove so slow running as they have in getting ready to run.

Massachusetts State Reform School for Girls.—We learn from the Boston *Advertiser* that the whole sum of $20,000, required by the Legislature at the last session, to be contributed by private individuals for the establishment of a State Reform School for girls, in order to secure the appropriation of a like sum from the treasury of the State, has been made up. Commissioners will now be appointed by the Governor and Council, to select a location for the institution.

Closing the Canals.—The Commissioners have decided on closing the canals on the 5th of December. Navigation could probably be continued some days later than that date, but it is deemed advisable to shut out the water thus early in order to prosecute the work of the enlargement now under contract.

Fossil Remains.—A few days since, says the Albany State Register, the tusks of a Mastodon, of enormous size, were discovered protruding from the inclined side of a marshy declivity, a few miles from the city of Poughkeepsie. Measures were immediately taken to excavate the place and exhume the skeleton.—We are informed that the work thus far has been remarkably successful, and the condition of the skeleton such as to promise the security of the most perfect specimen of the Mastodon ever found. The location is extremely favorable. The excavation, which is prosecuted under the direction of Prof. Morse, the discoverer of the Magnetic Telegraph, who resides at Poughkeepsie, has proceeded as far as the head and shoulders of the mammoth. The bones are partially petrified, as far as the exhumation has extended, and this promises the recovery of the entire skeleton in a more perfect state than any yet discovered.

News Paragraphs.

☞ The steamer Southern Michigan met with a serious and somewhat singular accident, while going up the lake on the 27th ult. When about 20 miles from Monroe, one of the wheels, which had been racked a little in a previous storm, burst its bands, and the whole mass of timber and iron composing it fell into the lake, leaving the shaft and flanges bare. The boat careened over, and there was great consternation among the passengers, about 100, for a few minutes; but the officers and crew, with great presence of mind, set to work, shifted the freight over, so as to balance the boat, and she made her way into port with one wheel.

☞ The Hornellsville Tribune says: 6,407 car loads of lumber have gone from the Western Division of the New York and Erie railroad in the last seven months. Allowing an average of 8000 feet per car, there would be 51,250,000 feet. As the cars measure about 30 feet in length, this would make a lumber train thirty-six miles and 2,120 feet long.

☞ Havana letters received at Charleston by the steamer George Dudley, are directed to accounts of the reception of the new Captain-General. Orders have been given to place the cells of the Moro, Cabanos, and other forts in Cuba, in a state of complete repair. Let filibusters beware or the old Moro will close its iron jaws over their heads.

☞ The towers of the Suspension Bridge across the Mississippi, at St. Anthony's Falls, are now nearly completed, and the workmen are busy twisting the wires, preparatory to stretching them across the river. The bridge seems likely to be completed in time to receive quite an income the present season.

☞ Coal of good quality has recently been discovered at Corunna, Mich., one hundred miles from Detroit. Ten thousand bushels have already been taken out, and it is now being mined at the rate of five hundred bushels per day, and sold at the rate of ten cents per bushel. This is better than a gold mine for Michigan.

☞ A Spiritual paper announces a new play by the spirit of William Shakspeare, entitled "The Hermit of Malta." It accompanies the announcement with some extracts, which show that the poet's genius has sadly deteriorated during the last three hundred years.

☞ A new kind of wheat has been introduced into California from Sonora, which, it is said, will, in its yield, surpass any other variety, being free from rust and smut, and maturing a month or six weeks earlier. This will, it is thought, be peculiarly adapted to the climate of California.

☞ The first meeting of the Board of Directors of the U. S. Inebriate Asylum—an institution for the reformation of poor and destitute drunkards, incorporated by the last Legislature—was held at Union Place Hotel, New York, on Wednesday evening of last week.

☞ A swarm of bees have taken possession of one of the lions at the entrance of Wynard Park, Durham, England, having formed their comb in the body of the statue, and gained an entrance by a hole in the ear.

☞ The Chicago Democrat of the 20th, says a contract has just been made in that city, by parties whose names it does not disclose, to deliver 100,000 bushels of spring wheat at one dollar per bushel.

☞ During the storm at Squam village, N. J., on the 19th ult., the sea rose at a rapid rate, and inundated the meadows. About 200 cattle were swept into Barnegat bay and lost, and 35 more managed to swim to the main land, a distance of eight miles.

☞ The Universalist Convention, which has just closed its annual session at Philadelphia, adopted strong resolutions in opposition to Slavery and the repeal of the Missouri Compromise. It meets next year at Middletown, Connecticut.

☞ It appears by a record kept at St. Petersburgh that the average date of the closing of the Neva by ice is the 13th November, hence the allied fleets have seven weeks yet for operations against Russia in the Baltic.

☞ There is a great dearth of news paper in St. Louis. The large sheets are obliged to curtail, and the smaller sheets to resort to all sorts of stratagems to send out their daily issues. The unusual drouth is the cause of this present scarcity.

Supposed Wreck of the City of Glasgow.

Capt. McLeany, of the barque Mary Morris, from Glasgow, reports: 18th August, in lat. 53 26, lon. 16 06, fell in with the hull of a large iron vessel, painted black, with a bright red bottom, apparently a Clyde built vessel; had three or four compartments; the wood work entirely burned out; sent some men aloft to look into her, some of whom report seeing machinery in her. It was very thick at the time, with a heavy sea on. Next day fell in with and took on board a full length female figure head, about seven feet in height, has a wreath on her head, with gilt stripes on her dress, hands extended. It is the impression on board the barque that the wreck was that of an iron propeller, and no doubt that of the City of Glasgow.

Quill Driving.—By the return recently presented to Parliament by the English Census Commissioner, it appears that the number of persons returned to the census as "authors," "editors," or "writers," in the year 1851, was eighteen hundred and forty-four; viz: seventeen hundred and thirty-eight males, and one hundred and six females; and that of these the great metropolis swallowed up the lion's share of eleven hundred and ninety-five. It further appears that England is fortunate enough to boast no less than ninety-two authors who are under twenty years of age.

Wheat Imported from England.—We hear of a shipment of 10,000 bushels of new wheat from Liverpool to New York. It will probably arrive next week. This is an eccentricity in trade that beats a transaction in high wines that took place this week. A cargo was shipped from Cleveland, on the advice of a telegraph despatch of the market here, and was sold here, but before it was landed it was re-purchased by the shippers, sent right back to Cleveland, and sold there at another advance.—*Buff. Dem.*

Large Fire in Philadelphia.—The steam plaster mills on York avenue and Callowhill st., Philadelphia, were destroyed by fire on Saturday last. The occupants were O. French & Co., and French & Richards. The loss is estimated at $45,000. Insurance $13,000.

News Brevities.

—— Ladies are now acting as clerks on some of the Mississippi steamboats.

—— The Yellow Fever is abating in Charleston and Savannah.

—— The Free Church of Scotland is raising $250,000 for church purposes.

—— The salt inspected at Syracuse, has this year exceeded the last 130,000 bushels.

—— The present population of Texas is estimated at near 500,000, and the annual increase at 150,000.

—— The weather at Quebec is cold for the season. On the 20th ult. there was a fall of snow.

—— The annexation of Boston and Charlestown has been carried by a majority of 10 to 1, in the former place.

—— The steamboat Cleona, on the Red river, with 500 bales of cotton, took fire on Sunday week, and was burnt.

—— The Aqueduct at Freeport, Pa., fell recently, and navigation on the canal there is consequently suspended.

—— Two hundred and forty paupers, direct from Irish almshouses, have lately been shipped to this country.

—— Rev. Geo. Hastings, for many years chaplain to the American Legation at Rome, died a few days ago in Tennessee.

—— Hon. G. W. Underhill, a Whig Senator in Arkansas, died on the 9th ult. He was a popular and estimable man.

—— At Savannah not over 1,600 of the white population is left. The hotels and stores in Augusta are all closed.

—— St. Andrews Church, building at Hamilton, C. W., will hold over 1,000 persons, and have a spire 180 feet high.

—— A letter received by the Hermann, and dated Hong Kong, July 22, reports the arrival at that place of Commodore Perry.

—— A party of Filibusters are about to sail from New Orleans to seize Tampico. The expedition excites ridicule in New Orleans.

—— Another of the New Orleans rioters has died, making the sixth life that has been sacrificed in that disgraceful affair.

—— The St. Louis Democrat notices a rumor that Senator Geyer, of Missouri, has resigned, and adds that it thinks it not unlikely.

—— The Protestant and German Catholics had a collision in Philadelphia on the 26th ult. Three were wounded by pistol shots.

—— S. D. King, Surveyor General in California, under the last Administration, is set down as a defaulter to the amount of $12,000.

—— The price of a commission in the English foot guards is, Lieut. Colonel, $45,000; Major, $12,500; Lieut. $10,000; Ensign, $6,000.

—— The Reciprocity bill, passed on Friday week by the Canadian Legislature, was signed by the Governor-General on Saturday.

—— Owing to the drouth, the Northwestern Fruit Grower's Association, to be held at Burlington, has been postponed for this year.

—— Four new locomotives have recently arrived from England for the Niagara Falls and Detroit Railroad, and 11 more are on the way.

—— Attorney General Drummond, of Quebec, has gone to Washington to endeavor to arrange for an early application of the Reciprocity treaty.

—— A quantity of heavy guns and munitions of war have been sent to Key West by our national government, for the fortification at that place.

—— The Legislative Council of Canada has appointed a committee to inquire into the charge of undue speculation by some of the late Ministers.

—— It is now satisfactorily ascertained that Schuyler, the railroad defaulter, has fled to Europe. A warrant for his arrest has been issued.

—— The seventy-first regiment was withdrawn from Quebec, Sept. 23d, and embarked for Liverpool, and are not to be replaced. Other troops will soon follow.

—— Merchants and others in New York, have contributed $540 for the relief of sufferers by the great fire at Belize, Honduras, on the 13th of last month.

—— Capt. Layfield, of the steamship Locust Point, from Boston to Baltimore, picked up a life-preserver that belonged to the lost steamer City of Glasgow.

—— The Massachusetts Pioneer Company to Kansas, have given the valley in which they commenced a settlement, the significant title of "Backbone Valley."

—— The Canal Board have appointed John L. Stephenson 1st Assistant Engineer, his appointment to take effect from and after the 17th day of August last.

—— Among the graduates at Yale College this summer, was Mr. Yung Wing, a young Chinese gentleman, who has spent eight years in this country acquiring an education.

—— A recent collision on the Georgia Railroad killed one of the engineers and a fireman, and severely scalded the other employes, but the passengers were not injured.

—— The steamer Troy, which left Troy on the evening of the 27th ult., went ashore near Peekskill. She was running slowly through a dense fog at the time of the accident.

—— An experimental trip has been made over the Railroad from Montreal to Quebec, in eight hours. The road will be formally opened for business on the 4th day of October.

—— Nicholas Dean, an old and highly respectable citizen of New York, is the Reform candidate for Mayor of that city. There will, it is presumed, be three or four others in the field.

—— Among the outward bound passengers by the Pacific was Capt. H. A. Adams, of the U. S. expedition, who was the bearer from Japan of the ratified treaty concluded by Commodore Perry.

—— A pumpkin vine sprouting out of a manure heap at Pittsford, produced thirty-four pumpkins, whose aggregate weight was 592 pounds. These, says an exchange, must be what people call "some pumpkins."

—— The Washington Union discredits the statement of a Paris correspondent of the Tribune, that Mr. Belmont has commenced a regular banking business at the office of the American Legation at the Hague.

—— A Quebec paper says a whale 45 feet long was recently killed near Green Island, by means of a small bombshell, fired from a peculiar musket, which burst after entering the body of the whale.

Literary Notices.

SYNONYMS OF THE NEW TESTAMENT. By RICHARD CHENEVIX TRENCH, D. D., Prof. of Divinity in King's College, London. New York: REDFIELD. 1854.

This little volume is the substance of a course of lectures addressed to the Theological students of the College in which Mr. TRENCH is a Professor, and his known ability makes commendation on our part unnecessary. His previous works, "The Study of Words" and "The Lessons in Proverbs," were truly valuable works; and this is no doubt of the same character, though addressed to a smaller class of readers. Sold at DEWEY'S.

HARPER'S MAGAZINE for October, is an average No. of that popular monthly, and that is saying enough, for the poorest ever issued contains double your money's worth. $3 per year, 25 cts. a number. Sold at DARROW'S.

THE KNICKERBOCKER MAGAZINE for the current month, gives its usual interesting variety. We observe that the "Letters from Poplar Hill" are concluded—they would make a readable volume. MCMAHON'S, Waverly News Rooms.

Foreign Intelligence.

Arrival of the Steamers Alps & America.

THE Steamer Alps arrived at Boston, and the America at Halifax, on the 29th ult.

The news from the seat of war is unimportant. The allied fleets, having on board 7,000 men, had left Varna, and were on their way to the Crimea. The Austrians were still in the Principalities, while the government of the country was making active exertions to stave off a collision with Russia.

Rumors are current of new propositions between the respective powers, but nothing definite has transpired. A correspondent of the London Times, from Varna Sept. 8, says:

The opinions of the Austrian Government, by its agents abroad, may be given in a very few words. These are, that Austria looks on the guarantees demanded by the Western Powers as the only basis of a durable peace, and must, therefore, at the same time she maintains her assumed neutrality, neglect no opportunity of urging Russia to accept them.

The writer also says that the Prussian Government is less inclined than before to make common cause with the three Powers. The excuse for her holding back being that Nicholas has, at the demand of the German Powers, consented to quit the Turkish territories, and therefore Prussia does not feel called upon to actively interfere in the quarrel with Russia.

The news from the Baltic is confirmatory of the opinion that no further important movements will be undertaken in that quarter this season.

FROM THE EAST.—A Constantinople correspondent writes that on the 30th ult. not a single English or French vessel remained in the Bosphorus. All had left to place themselves under orders of the Admirals in the contemplated attack upon the Crimea.

Mr. Soule, the American Minister, has written a very violent letter to the Diario, in reply to the charges of the Madrid press, of having participated in the recent events at that place. The following is a copy:

MADRID, Aug. 30th, 1854.

SIR—The tone and character of the article referring to me, published in your number of this day, indicate too clearly the influence which inspired it not to deserve from me the honor of a reply.

I absent myself from Madrid, because it is my pleasure to do so—being accountable to no one for my actions or conduct.

The fear of being insulted or menaced by persons, to whom my presence might be disagreeable, would never induce me to abandon my post. I fear neither the sneers of impertinent fellows, nor the daggers of hired assassins. Above all, sir, I don't fear the people. The people respect what is entitled to respect. They only stigmatize the wretches who flatter and deceive them. The people fight, but are not assassins.

With regard to the perfidious insinuations with which your article abounds, they are beneath my contempt, and I leave you the merit of the varnish with which you have glossed them over, and to those who dictated them the infamy of their invention.

I am, sir, your servant, PIERRE SOULE.

LIVERPOOL MARKETS.—Wheat was readily sold at an advance of 1d@2d the week. Flour was not in such active demand, but was 2s@3s better. Wheat is quoted at 7s 8d@8s 9d. American flour at 30s@31. Corn at 34s@36s for American white, and heavy at the close. Sales of Ohio at 33s.

Provisions—Reported quiet for all descriptions, and prices nominally as per Arabia.

California News.

Arrival of the Prometheus and the Geo. Law.

THE two above named California steamers arrived last week, bringing together 1038 passengers, $2,202,272 in gold, and San Francisco dates to Sept. 22d.

The English sloop-of-war Amphitrite, and the French sloop-of-war Artimise, arrived at San Francisco from Honolulu on the evening of the 16th ult.

The first number of the Spanish paper, La Cronica, was issued on the 16th ult. The mortality among the Chinese, large numbers of whom have lately arrived here, is very extensive.

It is stated on good authority that the English, French and Russian Governments have agreed not to disturb each other's possessions in the Pacific ocean.

The first public county school celebration took place on the 22d, at the Russ Gardens.—Nine hundred and thirty children were present.

The British clipper bark Skimmer of the Seas, which was reported to have been captured by a Russian frigate, off the Loo Choo Islands, arrived last evening.

SAN DIEGO AND SALT LAKE RAILROAD.

The San Francisco Herald says, Mr. A. Finklenburg, Civil Engineer, left this city on Friday last, by the Salt Lake Mail route, for St. Louis, where he is to join a party and return to this place, making reconnoissance for a railroad route. It is said that several heavy capitalists of Europe have taken the preliminary steps towards organizing a company, in conjunction with the Mormons of Salt Lake, to build a railroad from Utah to the Pacific—San Diego to be the western terminus.

UTAH.

The following is gleaned from files of the Deseret News to July 26, six weeks later than previous advices:

On the 16th of June the workmen began at the south-east corner to lay the foundation for the Temple Block, in Salt Lake City. It is to be of stone, 2.11 feet square.

The News says it is quite probable that the richest product of Green River county will be the coal from the extensive, rich and thick coal beds of Bitter creek, unavailable at present, merely from the lack of facilities for transportation to our settlements.

PEACE WITH THE INDIANS—PROSPERITY.—The Deseret News says: Our red neighbors remain friendly toward the whites; but there are rumors of slight disturbances, and one or two small fights between the Green River Snakes and the Uinta Utahs.

All kinds of vegetation is growing rapidly, and give indication of an abundant harvest.—The wheat especially looks unusually well.

A correspondent writing from Manti, July 5, says: On the 4th inst., Walker and his band all left with friendly feeling; we gave them two fat cattle and a quantity of flour. About the first of June last, some Indians came in and reported that the two Spaniards which Fremont sent back for some cached articles had been killed. They said that soon after the Spaniards took out the articles, some Indians rushed upon them, killed them and took the property, scattering the contents of the mail sacks and destroying the surveying instruments. I have not been able to learn what Indians committed this outrage. "All's well," and Manti will soon become a beautiful and populous city; and a good portion of the coming emigration would do well to settle in Sanpete valley, where they will find timber and fuel in abundance and easy of access, water plenty, and soil and grazing excellent.

Harmony, about three hundred miles south of Great Salt Lake City, is the extreme southern settlement of the Mormons. The News says: The southern settlements are reported to be full of industry, energy and enterprise in farming, building and various other useful avocations, and rejoicing in the midst of prosperity, in peace, general health and union.

The wheat fields of Utah are very extensive this year, and promise a most abundant harvest.

Brigham Young has called upon the heads of families to send out teams and supplies for the brethren on the road, and to receive them and give them employment and food until the harvest of 1855.

The News states that goods to the value of one million dollars are on the road from Missouri to Deseret.

At a meeting of the Saints on the 28th of June, missionaries were appointed to many distant lands, and John Smith, the eldest son of Hiram Smith, was voted to be ordained the Patriarch over the whole Church of Jesus Christ of Latter Day Saints.

OREGON.

The party who undertook the ascent of Mount Hood were successful, after encountering much difficulty.

The Portland Times says two ocean steamships ply regularly between this and other towns on the river, and our commercial interests are well represented.

Col. King has discovered an extensive quarry of granite rock within five miles of Portland. It is a valuable discovery.

Commercial.

BUSINESS AND FINANCE.

THERE has been a heavy specie movement during the week; the Prometheus and George Law bringing in two and one-fourth millions, and the Niagara and Pacific taking out one million seven hundred and fifty thousand dollars.

Money is comparatively easy in New York. Foreign commercial interests languish in consequence of the lack of demand for American produce abroad. The Cotton crop, however, is now coming in, and is an article for a supply of which all Europe must necessarily look to the United States.

An immense amount of business, both freight and travel, is done at present on both the Erie and the Central roads; the gross receipts on each of which, for the month of September, is in the neighborhood of $600,000. A large amount of forwarding business is taken from the canal by these roads, as produce holders cannot afford to wait a slow transit in times of a falling market.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE, Rochester, Oct. 4, 1854.

The downward tendency of the market still continues, notwithstanding the news by the last Steamers reports a stiffening of prices for breadstuffs abroad. Wheat sells in this city at $1.60 to $1.65 per bushel, and Flour to the trade at $8 to $8.25. Corn and Oats are both lower, the former bringing six shillings, and the latter 40 cents by weight, but a little less by measure. Barley has fallen five cents, selling at 80 to 85 cents.

Eggs are two cents higher; Butter and Cheese unchanged. Apples and Potatoes are both plenty and lower, the former (ball fruit) are worth two to three shillings, and the latter four to six.

Hay is also a dollar on the ton lower, and the supply abundant.

There is also a decline in grass seeds, Clover bringing $7 to $7.10 wholesale, and retailing at $8; Timothy $3. Other things in the market remain at previous quotations.

Marriages.

In Livonia, on the 27th inst., by the Rev. B. G. Riley, Mr. ROBERT B. PATTERSON and Miss LYDIA ELIZABETH, daughter of Jas. Van Slyk, Esq.

Advertisements.

ADVERTISEMENTS inserted in the RURAL NEW-YORKER at 25 cents a line, each insertion,—*to be paid in advance.*—Brief advertisements preferred, and we do not wish to give any one more than four successive insertions. Our space is limited, and we wish to accommodate and benefit as many applicants as possible,—at the same time interesting our readers by presenting something new, weekly.

TO THE CHARITABLE.—The Managers of the "Home for the Friendless," would inform its friends throughout the city and adjacent country, that they have recently undertaken to furnish supplies for the Home, the inmates of which have heretofore been boarded by the Nation.

With the present high prices of provisions, any gifts, and especially articles of food, would be particularly acceptable. The "Home" is located on the corner of East Avenue and Alexander Sts. 218-tf

STRAY CATTLE.—Strayed from Oaks Corners, Ontario Co., on the 18th day of June last, two cows one (dry) black cow, with white face, the end of the tail white; the other pale red, with lined back, white bag and black teats, gave milk. Also two 2 years old heifers, bright red. Any person who will give information to the subscriber where all or any of them may be found, shall be liberally rewarded. Address JAMES WEBSTER, 218-2t* Oaks Corners, Ontario Co., N. Y.

FARM FOR SALE.

SITUATED in the village of Honeoye Falls, 120 rods from the Depot of the Canandaigua and Niagara Falls R. R. It contains 105 acres—15 wood-land, the remainder in a high state of cultivation—is watered by living springs, has an orchard of 100 trees, and suitable buildings in good repair. Terms liberal, as it will be sold to close the estate. Apply on the premises to

215-4tow* MRS. CATHERINE SANFORD.

ASIATIC FOWLS.

PHEASANT COLORED CHITTAGONGS, Brahmas, Cochins and Shanghais,—genuine, as to blood—of the broods of May and June, for sale at one dollar the pair. The Chittagongs are solid, compact birds, although, when full-grown, of the largest size, and are not surpassed as layers. The cocks wear high colors. The pullets a brownish buff, tipped with black—often of great beauty of plumage. Two to five, in one cage, delivered at the Express office, the price will be five dollars. DAVID ELY,

Oct. 2, 1854.—215tf 69 Pitzhugh St., Rochester, N. Y.

DURHAM BULL FOR SALE.

THE subscriber offers for sale his splendid Bull "Barnum," four years old last spring—was sired by "Old Splendor," and needs but to be seen to be admired.

H. WILLARD.

Single copies 37½ cts., or four for One Dollar. ☞ *Sent by Mail, free of postage, to any part of the United States.* Address as above. 218-tf

THE SCIENCE OF NATURE.

A New School Book, entitled First Lessons in Chemistry and Geology, as Applied to Agriculture.

BY J. EMERSON KENT, A. M., M. D.

A NEW school book—the first American work ever issued as the best book on "First Lessons in Chemistry and Geology, as applied to Agriculture," designed as the first step for the young, to be used in all our common schools, is now submitted to the educational public. Some indeed protest against the introduction of all modern improvements in making the earth productive; still the great agricultural interests of our nation depend upon a rising generation of practical farmers, who will till the soil as much by a comprehensive knowledge of the laws of chemistry, as by the sweat of the brow.

The subject of agricultural chemistry cannot but soon commend itself to the world as the most important of all studies, and, in fact, the wealth of this country would be doubled within one year were all that saved which is now lost by stupid, bungling agriculture. A volume of recommendations could be given to the public, but it is not necessary.

School Committees and Teachers will be furnished with a copy, gratis, for examination, by mail, post paid, on application to the undersigned. Price, 25 cents.

DAYTON & BENTWORTH, Publishers,
30 Washington St., Boston, Mass.

Also for sale in quantities at F. Cooperthwait & Co., Philadelphia; Cady & Burgess, New York; Pillsbury & Co., Buffalo, N. Y.; Barrow & Brother, Rochester, N. Y.; Wm. Wilson, Poughkeepsie, N. Y.; H. M. Rulison, Cincinnati, O.; and by all other booksellers in the United States.

N. B.—A few men of the right ability are wanted to travel through every State in the Union, and introduce this work into schools. A liberal commission will be paid. Gentlemen who travel for health or recreation will find this occupation a lucrative and agreeable employment. Address as above. 217-3t

UNDERDRAINING TILE.

THE ROCHESTER BRICK AND TILE MANUFACTURING CO., have on hand a large supply, and are constantly manufacturing Tile of the different varieties and sizes used for underdraining farm lands. The extent of the failure of the wheat crop the present season has, more conclusively than ever before, shown the utility of it has been for many years before, shown the utility of Tile Draining—for in no instance, and it is safe to say on Tile Draining—for in no instance, and it is safe to say on no premises where lands were properly underdrained, has wheat been known to be injured by winter kill,—which every one knows is caused by the freezing and thawing of water standing upon the wheat.

The following is a list of the prices for the different varieties and sizes of Underdraining Tile delivered at our premises in Brighton, one and a half miles east of the city of Rochester. The Company will deliver Tile on canal boats at fifty cents advance per thousand, on their yard prices, and on wagons running on Lake Ontario at reasonable charges, for transportation. Prices as follows:

3 Inch Pipe Tile	$7 00	per thousand.
1½ do	8 00	do.
2 do	9 00	do.
3 do	12 00	do.
4 do	22 00	do.
5 do	40	per rod.
2 Inch Horse-shoe Tile	$8 00	per thousand.
3 do do	11 00	do.
4 do do	14 00	do.
8 Inch Round Tile	80	per rod.

1000 Tiles will lay 66⅔ rods, or 15 Tiles per rod.

CHEMICAL ANALYSIS.

J. BRYAN, Practical Chemist, 112 State St., Rochester, N. Y., is prepared to make *full and accurate* analysis of Minerals, Soils, Metals, Mineral Waters and Chemical Compounds, and articles suspected of adulteration and *Poisons*, either organic or inorganic, and in quantity or quality. It is necessary to send one or two ounces of a solid, and a pint or more of a fluid for examination. 241-13t

HOME PROTECTION.

TEMPEST Insurance Company, Capital $250,000, Organized December 24, 1852; Chartered March 1, 1853. Homes only Insured by this Company. No one risk taken for more than $3,000.

Many distinguished persons have insured their homes, to the amount of $3,000 each, in this Company, among whom are Ex-President VAN BUREN, Kinderhook; Ex-Governor SEWARD, Auburn.

AUBURN, May 16th, 1853.

To whom it may concern:—We are personally acquainted with many of the Officers and Directors of the Tempest Insurance Company, located at Meridian, Cayuga Co., N. Y. In our opinion they are among the most wealthy and substantial class of Farmers in this county.

J. N. STARIN.
ELMORE P. ROSS.
THOMAS Y. HOWE, Jr.

The above gentlemen will be recognized as the Cashier of Cayuga County Bank, Auburn; Postmaster, Auburn, and Ex-Member of Congress, Auburn, Cayuga County.

N. B.—The public are cautioned to bear in mind the name, (*Tempest,*) and not submit to an imposition daily practiced by two-by-four Mutual Co's.

241-4t T. R. TIMBY, Secretary.

EYE AND EAR INFIRMARY.

DR. WALKER, Oculist and Aurist, (from London, England,) may be consulted daily, and testimonials obtained at the office, 82 State St., Rochester, N. Y. 242-tf.

Poetical.

MORNING.

BY HARRY GARY.

The morn is dawning, o'er yon hill is stealing
The mighty day-king, in his bright array;
Pale stars, as late their brilliancy revealing,
Sink back in awe at the approach of day,—
A flood of burnished light is nature's dress,—
Earth smiles and blushes in her loveliness.

The grey light to the west is slowly wending,
Bearing with it each vestige of the night;
A veil of velvet light o'er all impending,
Glows brighter as its wearer looms in sight.
The crystal fount reflects the scene fair while,
And dew-drops bear the semblance of its smile.

O! earth is beautiful at morning's dawning,
Ere loud tumultuous scenes awake to life,
While enmity and wrong for victims longing,
Bow to a sweet repose exempt from strife,
All nature's hushed, the flattered rich, the poor,
The just and unjust find this rest secure.

The sick upon his fevrish bed is praying
For the approach of this most sacred hour,
And anxious, waits its dawn, his mind still straying
To that bright morn where sickness knows no power.
He sleeps and dreams of that celestial *Home*,
And wakes to find the morning hale come.

O, what an hour is given us for waking—
To call us to the duties of the day;
The sun has sent its smiles, and night is breaking
As breaks our dormant thoughts at reason's ray.
Who can but turn from life's wrong-sway of power,
And thank the *Author* for this hallowed hour.

Fenner, N. Y.

Rural Sketch Book.

AN IRISH SERVANT.

BY MRS. S. C. HALL.

Mrs. L. was a lady in London, who, when she advertised for a housemaid, added the very unanimable, but by no means unfrequent, "P. S. —No Irish need apply." Notwithstanding, a very decent, pretty, respectable-looking young Irishwoman did present herself in the lady's drawing room, as an applicant for the situation.

"I told you," said Mrs., "that no Irish need apply."

"It was on the paper, I know, ma'am," answered the girl; "but I thought if I had a good character, and could do my work well, that no lady could refuse me bread because of my country."

Mrs. L was a young housekeeper, and she worded her advertisement by the advice of friends; persons cherish a prejudice as if it were a perfection, and, forgetting altogether how frequently they had idle, dirty, careless and dishonest English servants, pour out the vial of their wrath upon the Irish, from whom they withhold the power of exhibiting their advantages by contrast.

Fortunately for Kitty Gallagher, however, Mrs. L was considerate as well as just. She looked into the poor girl's open and honest countenance as she stood with the flush of honest indignation on her cheek, inquired carefully into her character, and examined her three or four written discharges, which of course "went for nothing," but subsequently called on two persons who had known her; and the result was her engagement.

Mrs. L was the wife of a highly respectable mercantile man; one of a class who, of all others, entertain great distrust of the Irish people —their methodical and business-like habits preventing them from making allowance for the volatility and heedlessness of their mercurial neighbors. Mrs. L. had consequently to encounter the astonishment of her acquaintances, and the warnings of her husband.

With every desire to do right, and habits that were tolerably keen and very active, Kitty found she had so much to learn that she frequently cried herself to sleep; as she told us herself, it was not the hard work that overcame her—she could do ten times as much and think nothing of it—but "the particularity"—the necessity for spotless stairs and carpets, for stoves polished like mirrors, for total absence of dust everywhere; for a manner staid, silent, smileless, and a voice never heard except in the most soft and brief reply; then the getting up of fine things; she could have washed, to make look like snow, table-cloths, sheets and dresses, but the difficulty of small plaiting and clear starching, the very clock-like regularity of the house broke her heart—there was a place for every thing, and every thing must be in its place. Then her fellow servants would put her wrong instead of right, and sneer at her afterwards; they ridiculed her country, and wondered she could eat anything but potatoes, like all her people. Though loving to laugh, she did not relish being laughed at; and between her desire to do well in all things and her natural sensitiveness, poor Kitty had enough to encounter during the first twelve months of her servitude. On the other hand, Mrs. L. fancied she acted imprudently. Kitty was not only blamed by the other servants for what she did not; her eagerness to please occasioned blunders and mistakes; her phraseology was perplexing; and her foot was not as light, and her manner as fully formed as that of a London servant. But then her habits were very inoffensive. She was ever cheerful —willing to assist in every one's work; no matter how often, how late or how early her services were needed, she was always ready. By degrees she blundered less, and absolutely dusted both corners and skirtings without "following." Then she was so humble when praised!

At first, a sort of womanly spirit prevented Mrs. L. from confessing she was wrong in judgment, and by degrees—slow, but sure degrees—Kitty established herself in her mistress' good opinion. We have observed a great number of the Irish in England, of all grades and classes. No instance has ever occurred within our knowledge where they have failed in attaining their object, except by being drawn off from it to run after something else; when they really persevere, when they add to their native energy a singleness of purpose, we never knew them to fail. Kitty, in her humbler way was evidence of this; she felt deeply grateful to her mistress for having made an exception in her favor; she had good sense enough to understand that she had bettered her condition, and to feel that, in England, girls "with two or three hundred apiece" were not ashamed to go to service. She resolved to master the difficulties with which she was surrounded, and to keep her place; gradually her good humor and good nature became appreciated. Mrs. L's two little ones caught the scarlet fever, and when the nurse declared she was afraid to remain with her charge, Kitty volunteered to take her place.

"I am not afraid," said she; "and sure God can keep the sickness from me by their bedsides as well as by my own; and if I was to go, His will be done; but I am not afraid."

Night and day this girl watched with their mother over the children; at her request no stranger smoothed their pillows or aided her exertions; what she lacked in skill she made up in actual tenderness, and her quickness and attention never wearied; in time, the children recovered, but they had become so attached to their Irish nurse that they entreated their mamma to let her remain with them, and the former nurse took Kitty's place. When Kitty was a girl there were no national schools, and at the time she was so ignorant of "book-learning" that she did not know her letters; but she managed to learn them from the children, and concealed her deficiency so well that Mrs. L. told us it was not until Catharine could read, that she confessed how entirely uninstructed she had been.

During a period of five years she continued in her place, unspoiled by much kindness; and frequently did her mistress boast to her acquaintances of the treasure possessed in an Irish nurse; it was quite true that Catharine's accent was anything but correct, still her mistress declared it to be "her only fault," and one for which her fidelity and good conduct amply atoned. Love now somewhat interfered with her duties; a master carpenter paid his addresses to the kind Hibernian; her mistress was too just to prevent her settling respectably, and as her intended husband had formed an engagement to go to New York the following spring, Kitty decided on remaining with her "darlings" until within a week of their departure, when she was to exchange the guttural of Gallagher for the euphonious name of Miller.

Hitherto Mr. and Mrs. L. had enjoyed in life uninterrupted sunshine—every thing prospered which the merchant undertook; but a few eventful months made a terrible change in their circumstances; loss followed loss with fearful rapidity, until at last their house was advertised to be sold, and Mrs. L., firm and patient in adversity, as she had been cheerful in prosperity, placed Kitty's quarter's wages in her hand, and told her that for the future, she must herself attend to the children: her voice faltered as she thanked the poor Irish girl for the care and tenderness she had bestowed upon them; and she added a wish that as the time had arrived when Kitty was to be married, she would inform her of her prospects after she and her husband had been some time in New York, and rely on Mr. L. to remember her faithfulness, if ever he had the power to serve them. We quote Mrs. L.'s own words:

"Catharine," she said "stood without replying until I had done speaking. I was more agitated at parting with her than with all my other servants; she had evinced more affection towards me and mine in an hour than the others had done in a year."

"Is it to leave you, ma'am, you want me, and to leave the young master and miss? Ah, then, what have I done to make you think I've no heart in my bosom? I'd be no burden to you, but I'll never leave you. Leave you in your trouble? Sure it's neither peace nor rest I'd have by day or night, to think it's my two hands you'd be wanting and they not in it.—And as for Robert Miller, it would be better for him to be by himself for the first two or three years; and so I *told him this morning when we parted.*"

"'I'll never leave the mistress in her trouble, Robert,' I said; 'and if it's any bar, why I'll give you back your promise;' and he would not hear of that, but took on a good deal at first; only it's all over—time and distance are nothing to true hearts, and if he does not forget me I'm doing my duty still. I'll never leave you in your trouble."

"Her devotion, so simple, so perfectly unaffected," added Mrs. L., "drew more tears from my eyes than my own sorrows; I had nerved myself for them, but this overpowered me; the children became wild with joy when they found Kitty was to remain with them; and she certainly was the good spirit of comfort in our humble cottage. But this was not all; she had saved in my service about fifteen pounds, and every farthing of this money she spent in buying in, at the auction which finished the desolation of our once happy home, such small things as she believed me most attached to; these she had conveyed to our dwelling secretly, and then with a delicacy that must be innate, she entreated me to forgive the liberty she had taken, and endeavored to persuade us she had but returned us our own.

"I often think that my husband's proud spirit would have been bowed to breaking, but for the true nobility of Catharine's heart; toiling as she was in all capacities for our sakes, I never saw a shadow on her brow. She was an existing proof (amid much that led us to believe the contrary) of the disinterested generosity of human nature; she taught us the value of usefulness—she made us ashamed of our prejudices, and never did she once make us feel that she had sacrificed a pin's worth to our interests."

This is no romance—it is simple and unvarnished truth; both the mistress and the servant are intimately known to us; we have not added an iota to the story as the former told it to us. Kitty's generosity of character did not efferverce; during a period of three years she remained firm to her purpose, because Mrs. L. needed her services. At length a distant relative of Mr. L.'s died, and as next of kin Mr. L. inherited a very considerable property; then, indeed, Mrs. L. found Kitty more than once weeping over the letters she could hardly read, but which nevertheless, she knew by heart: it was not, however, until she had succeeded in training "a cousin of her own," whom her mistress not only consented, but was happy to receive, that Kitty had performed her promise, and rewarded her lover for his constancy.

How many other instances of devoted and disinterested attachment of Irish servants to their employers we might add to this, and yet record only cases entirely within our own knowledge.

May we not hope the prejudices against them in this country, so rapidly diminishing, will be, ere long, altogether gone; and then, when their advantages—of faithfulness, industry, and willingness to labor, in all ways and on all occasions—have been considered and appreciated, they will acquire those, perhaps equally essential, habits of neatness and order, into which they have hitherto not been properly disciplined, because kept far too much away from opportunities of improvement.

"O, MOTHER! I'VE LOST MY KNIFE."

There's a lump in his throat and hot tears in his eyes, and his little heart is full to overflowing. It was a real "Rodgers," and the "big blade" was sharp as a razor; and he wouldn't have "swapped" with any boy at school.—Your fifty feet on State street is not so valuable to you, sir, as that "Wharncliffe" was to him,—and it is lost!

Children have greater capacity than we have for joy and sorrow. When Willie found that knife under his plate, just after Father had come back from New York, there was more pleasure in his boy heart, as he examined the bright blades and tried the clicking springs, than the acquisition of an "Hon." or a thousand dollars could give a grown up man. And when he searched his pocket, turning out the treasures of strings and slate pencils, the top which that sharp knife whittled so easily from the end of a spool, the peg which he had made Johnny "mumble" yesterday, and all the other things which go to fill up the deep right-hand pocket of a boy's trousers, and that knife was not among them,—as he came to the sad conclusion that it was lost, a grief filled his heart much harder to bear than yours was when you lost the election, or failed in that last speculation.

"You are a careless fellow, and don't deserve to have a knife! You shouldn't have wrestled with Charley—tearing your clothes and losing things out of your pockets. Go and wash your face! O, these boys!"

Mrs. Smith, boys will be boys. They are careless, variably careless and light-hearted.—Willie didn't stop to think that he had any clothes on when Charley "stumped" him to throw him; even that cherished knife was forgotten in the last moment of strife. You don't understand a boy's heart. You never was a boy yourself, unfortunately, and girls, I believe, don't "rassle." But take an older boy's advice and don't add to the sorrow which is more than heart full now. Cheer him up a little, if you can; offer to give him another, if he will bring home a good report from school next Saturday. A boy can't exist without a knife, any more than you could without your scissors; and a boy can't be a boy,

"A bold, free-hearted, careless one,"

without wearing and tearing his clothes, and sometimes your patience; and he must lose a peck of knives before that merry heart of his gets tamed down to anything like quietness.—Keep your lecture on carelessness till another time; he won't profit by it now; you only aggravate his sorrow.

"O, would I were a boy again."

For as Holmes says so truthfully:

"O, what are the pleasures we perish to win,
To the first little shiner we caught with a pin!"

MINISTERING SPIRITS.

The reunion of parents and children in Heaven, as well as of earthly friends, is a cheering and delightful thought. And the idea that our departed friends may sometimes be near us, or wait to welcome us to the silent land, is well suited to impress the mind.

A little girl, in a family of my acquaintance, a lovely and precious child, lost her mother at an early age—too early to fix the loved features in her remembrance. She was as frail as beautiful; and as the bud of her heart unfolded, it seemed as if, won by the mother's prayers, to turn instinctively heavenward. The sweet, unconscious, and prayer-loving child was the cherished one of the bereaved family. But she faded away early. She would lie upon the lap of a friend who took a mother's care of her, and wind one wasted arm around her neck, would say, "Now tell me about mamma."—And when the old tale had been repeated, she would say, softly, "Take me into the parlor; I want to see my mamma." The request was never refused; and the affectionate child would lie for hours contentedly gazing on her mother's portrait. But,

"Pale and wan she grew, and weakly,
Bearing all her pains so meekly,
That to them she grew still dearer,
As the trial hour drew nearer."

The hour came at last—the weeping neighbors assembled to see the child die. The dew of death was already on the flower, and its life-sun was going down forever. The little chest heaved faintly—spasmodically.

All at once, a brightness, as if from the upper world, burst over the child's colorless countenance. The eyelids flashed open, the lips parted, the wan, subsiding hands flew up, in the little one's impulsive effort as she looked piercingly into the far spirit world.

"Mother!" she exclaimed, with surprise and transport in her voice—and passed with the breath into the mother's bosom.—*Eclectic.*

Youth's Corner.

ILLUSTRATED REBUS, NO. 41.

☞ Answer next week.

[Written for the Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 51 letters.

My 5, 55, 1, 15, 8, 25, 3, 37, 51, 36 is a dealer in riddles.

My 33, 45, 21, 9, 38, 7, 40, 12 is an agreement.

My 44, 10, 48, 30, 21, 47, 32 is a train of attendants.

My 1, 17, 42, 19, 13, 49, 6 is a worshipper of idols.

My 26, 14, 27, 41, 22, 16, 23, 60, 39 is a plant.

My 31, 18, 46, 29 is a four-inch measure.

My 43, 31, 2, 29, 10, 28 is a city in Europe.

My 11 in English criminal law was branded on felons.

My 20 is the name of a bird.

My whole was the exclamation of a distinguished officer in the American Revolution.

Root, N. Y., 1854. O. H.

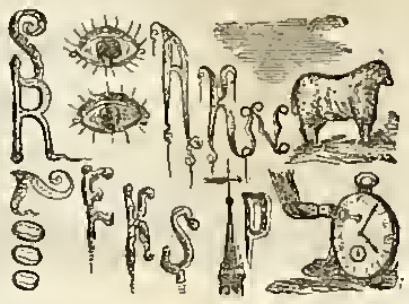
CHARADE.

Have you my first in perfect state?
You're no bad aprrulation;
'Tis silent, yet is thought to aprak—
Is keen in observation.

My second's a commanding air,
My first it krrperth under;
What Homer made a *Jovial* thing,
That oft denoted thunderr.

My whole is called to a hair
Both in my first and second;
Without it would the gentlest she
A barefaced jade be reckon'd.

[Blackwood's Mag.



Answer to Illustrated Rebus No. 39.—*Sir Isaac Newton expired winding up his watch.*

Answer to Miscellaneous Enigma in No. 39.—*Harper's Statistical Gazetteer of the World.*

Answer to Charade in No. 39:

Who finds his *level* falls below
His own good estimation,
But engineers their level make
Off on the highest station.

In *level* see the letter v,
(Numerical the riddle)
For though five letters make the name,
You find *five* in the middle.

Turned round, still *level*, level is.
But head and tail discover,
That little less will stand for *eve*,
A little more for *ever*.

Wit and Humor.

The Knickerbocker tells of a man who stole a five dollar bill out in Indiana. His counsel tried to prove that the note was not worth five dollars, it being at discount. The prosecutor said he knew the thief was the meanest man in the State, but he did not think he was so all-fired mean as not to be willing to steal Indiana money at par.

One Sunday, when the Minister of Udney entered the kirk, he was no less surprised than indignant to find that daft Jamie Fleming had taken possession of the pulpit. "Come doon, Jamie," said his reverence. "Come ye up, sir," answered Jamie; "they're a stiff-neckit and rebellious generation, sir, an' it 'ill tak' us haith to manage them."

A man praising porter, said it was so excellent a beverage that, taken in great quantities, it made one fat. "I have seen the time," said another, "when it made you lean." "When?" asked the eulogist. "Last night—against the wall."

The Boston *Commonwealth* says that 600 of the candidates elected to Congress in Maine is a "Morill democrat," so called to distinguish him from democrats who are *Immorrill!* Mrs. Partington must look to her honors.

The young lady who was carried away by the "force of a remark," came in last night on a "train of thought."

A servant girl, who was employed to pickle her master's cabbages, took the opportunity to cabbage her master's pickles.

Milk is rising in price in Boston, whereat the papers complain loudly. They say the article is high enough without *chalking* it up.

HICKOK'S PATENT CIDER MILL,

As improved for 1854, received over Fifty Premiums and Diplomas in 1853. This Mill is warranted superior to all others. Sold by the following Agents, who will supply pamphlets containing descriptions, &c.:

IMPORTERS, WHOLESALE AND RETAIL DEALERS IN

Foreign and Domestic Dry Goods,

No. 53 Main Street, and Nos. 1 and 3 North St. Paul Street,

GAFFNEY'S BLOCK, ROCHESTER,

Have now in store one of the largest stocks of Dry Goods ever brought to this city, in which may be found every desirable article of Ladies' and Gents' Dress Goods, adapted to the season. Their improved facilities for IMPORTING, and the great advantage of having a resident partner in New York, daily attending the Auction Sales, enable them to offer to Merchants and Dealers, by piece, case or bale, as cheap as can be purchased in the New York and Boston Markets.

WHOLESALE ROOMS NOS. 1 & 3 NORTH ST. PAUL ST., GAFFNEY'S BLOCK, ROCHESTER.

Summer Dress Goods.—We have just opened a very large stock of Summer Dress Goods, consisting of a fine assortment of Brilliants, plain and figured Barèges and Tissues, plaid and striped Poupre Silks, Muslins, plaid and striped Lawns, Printed Jaconets, &c., &c. The styles are entirely new and beautiful.

GAFFNEY, BURKE & CO., 53 Main St., Rochester.

Broche and Crape Shawls.—We have now on hand a very large stock of Broche and Crape Shawls, all colors and qualities, which we are selling at very great bargains, as they were purchased much less than cost in import, at an Auction Sale.

GAFFNEY, BURKE & CO.,
Gaffney's Block, 53 Main St., Rochester.

More New Silks.—We have just received another large assortment of Summer Silks, from an Auction Sale, which were purchased CHEAP FOR CASH, and will be sold at less than cost to import. The styles are very handsome and entirely new. We have also just received 40 pieces of those celebrated BARÈGE SILKS, which we are selling as cheap as usual. GAFFNEY, BURKE & CO.,
53 MAIN ST., GAFFNEY'S BLOCK, ROCHESTER.

KEDZIE'S RAIN WATER FILTERS.

MANUFACTURED BY

J. E. Cheney & Co., Rochester, N. Y.

The use of water impregnated with lime and other mineral substances, in the opinion of all medical men, is one of the chief exciting causes of many diseases incident to the varied climate of this country.

These Filters have been fully tested, for many years, by hundreds of families in this city and in various parts of the country, and have in all cases given the highest satisfaction.

Rain water, of whatever color, taste, or smell, by this means becomes as clear as crystal. 226-1amif

FARMERS' AGENCY.

Being a Practical Farmer, and having considerable experience in the selection and use of Farm Implements, and living in the vicinity of extensive Seed and Implement Stores and Agricultural Implement Manufactories, and extensive Nurseries of the choicest fruit and ornamental trees and knowing the difficulties that farmers have to contend with in the selection of these in the hustle seasons of the year, I will select, purchase and carefully forward anything in the above line for a small compensation. Satisfactory reference given in all cases when required, and the money promptly returned in all cases where the wishes of the sender cannot be complied with. 232-1am-tf

Address I. A. CLARK, Marion, Wayne Co., N. Y.

WOOD AND COPPER PLATE ENGRAVING.

MILLER & MIX, Designers and Engravers, No. 16, third story, Arcade, Rochester, N. Y., will be happy to exhibit specimens of their work, embracing a great variety of book illustrations, views of public and private buildings, landscapes, portraits, machinery, society seals, &c. Particular attention given to engraving Agricultural Implements, Portraits of Domestic Animals, &c.

Invitation, Wedding, Visiting and Business Cards Engraved and Printed on short notice, and in a style to give entire satisfaction. Orders by mail will receive as prompt attention as though ordered personally. I. C. MIX.
232-tf JOHN MILLER.

LAND PLASTER

At Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.

217-4m. JIREH BOWLEY.

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

The Wool Grower and Stock Register is the only American journal devoted to the important and profitable branches of *Wool and Stock Husbandry*. It contains a vast amount of *useful and reliable* information on the above and kindred subjects, and should be in the hands of every owner or breeder of Sheep, Cattle, Horses, Swine, or Poultry—whether located East or West, North or South, for the most of the matter given in its pages is equally adapted to all sections of the Union, the Canadas, &c. The Sixth Volume, commencing July, 1854, will be

Enlarged to 32 Octavo Pages Monthly!

And improved in both Contents and Appearance. Among other matters of interest to Wool Growers, Breeders, Graziers, Dairymen, &c., the new volume will contain DESCRIPTIONS OF PURE-BRED Cattle, Horses, Sheep, etc., and the Names and Residences of the principal Breeders and Owners of Improved Stock throughout the country. It is published in the NEST STYLE, and ILLUSTRATED WITH MANY ENGRAVINGS—including Portraits of Domestic Animals, Designs of Farm Buildings, &c., &c. The careful REVIEWS OF THE WOOL AND CATTLE MARKETS, given in each number, are alone worth many times the price of the paper.—To Wool Growers this feature is invaluable.

TERMS—Only Fifty Cents a Year; Five Copies for $2; Eight for $3,—*in advance.* Any additional number at 37½ cents per copy. Club papers will be sent to different post-offices, if desired. ☞ Back volumes (well bound in paper, for mailing) furnished at above rates.

☞ NOW IS THE TIME TO SUBSCRIBE and form Clubs. Money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

☞ Mr. C. MOORE, of Gerry, Chau. Co., is authorized to act as Agent for the RURAL NEW-YORKER, and for the WOOL GROWER AND STOCK REGISTER, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

☞ The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. Berry,—H. O. White,—T. E. Wetmore.

The Rural New-Yorker is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this County,—rendering it a complete Agricultural, Literary and Family Newspaper.

☞ For Terms, &c., see last page.

Rural New-Yorker.

Progress and Improvement.

CARBONACEOUS MATTER IN THE SOIL.

An article from our friend Samuel Williams, of Waterloo, published in the Rural of September 30th, during our absence at the London and Detroit fairs, was intended to call out our views on the value of carbonaceous matter in the soil. Mr. W. says: "I believe that Messrs. Lawes and Gilbert's theory goes rather to degrade the importance of carbonaceous matter in the soil as a necessary means of supplying carbonic acid to the roots of plants." We do not know that these gentlemen have propounded any *theory* on the subject, and will therefore give our own views, based principally on their experiments.

All animals or vegetables in decaying or burning give off carbonic acid and ammonia, which, if not retained by surrounding matter, fly off into the atmosphere, *and every shower brings these gasses back again to the earth.* It is probable that all the organic elements of plants are absorbed as carbonic acid and ammonia, and it becomes, therefore, a highly interesting question as to how far the atmosphere or rain can supply these gasses to the plant. On this question Mr. Lawes' investigations throw much light. He finds, from a systematic series of experiments on wheat grown on the same soil each year for eleven years, that the atmosphere, rain and soil combined did not supply *ammonia*, on an average, for more than seventeen bushels of wheat per acre, but that the rain and atmosphere, and the *same soil*, supplied sufficient *carbonic acid* for at least forty bushels per acre. Hence an additional quantity of ammonia gave greatly increased crops of wheat, while carbonaceous manures gave no increase whatever. For turnips, on the other hand, it was found, from an equally extensive and prolonged series of experiments, that the atmosphere, rain, and the *same soil* did not supply sufficient *carbonic acid* for a large crop, and hence an application of carbonaceous manures was attended with an increased produce. It would appear, therefore, that the value of "carbonaceous matter, in the soil, as a necessary means of supplying carbonic acid to the growing plants" depends to a great extent on the plants to which it is applied. There is obviously, from the facts above mentioned, a great variation in the quantity of carbonic acid required by the different crops commonly cultivated. The atmosphere and rain are capable of supplying all that some crops need, while for others they cannot supply sufficient for a maximum yield, and it must therefore be added to the soil in manure. We think Mr. Lawes' experiments clearly prove that an application of carbon to the wheat plant is altogether unnecessary. But how far the same may be true in regard to Indian corn experiments alone can determine.

It by no means follows that the large yield of Indian corn referred to, on a "recently drained swamp on a black carbonaceous soil," was owing to the carbon in the soil. The vegetable matter undoubtedly contained nitrogen, which, when the swamp was drained and the atmospheric air admitted, was converted into ammonia, and it is at least quite as probable that the large crop was due to the presence of ammonia as to that of carbonic acid. Mr. W. says: "I have long since noticed that a drained carbonaceous soil, rich in humus, always contained enough of ammonia and inorganic matter for the production of large Indian corn." The carbonaceous matter in the soil was of course originally formed from vegetables, and it is now generally admitted that all plants, even the *Cryptogamia*, contain both inorganic matter and nitrogen, and hence it is not strictly correct to call soils formed from them "carbonaceous," and especially should we be on our guard against concluding that because these erroneously called carbonaceous soils produce good crops, carbonaceous matter in a soil is particularly beneficial.

We have little doubt but that the vegetable matter in the "drained swamp" contained a considerable quantity of *all* the inorganic or ash constituents of Indian corn, wheat and other cultivated plants, and in addition to the carbon, hydrogen, &c., as *much nitrogen as is generally found in ordinary, well preserved barn-yard manure.* In plowing under a crop of clover, in the language of some writers, the soil is supplied with a large amount of *carbonaceous* matter,—and this is true,—but the clover turned under contains more *nitrogen* than the richest barn-yard manure, (dry clover contains generally about two per cent. of nitrogen, and we have found samples containing as much as 3 per cent., or *six times* as much as common barn-yard manure.) Now these same writers call barn-yard dung a *nitrogenous* manure; and to be consistent they should also call soils abounding in vegetable matter *nitrogenous* rather than *carbonaceous.*

The idea of the free hydrogen of the "drained swamp" referred to, uniting with the oxygen of the atmosphere, and thus forming water "that fed the growing corn," is improbable. There is no necessity for speculation in the matter. A "drained swamp" from "three to five feet deep, resting on clay," we should expect, even in the driest summer would be able to supply sufficient water for a "perfect crop of Indian corn." Certainly if it could not, the small amount formed from free hydrogen would not help it much. Our Genesee wheat contains about fifteen per cent. of water; and a soil may appear very dry to the eye and yet contain a considerable amount of water, which the roots of plants may be able to extract. It must be a very dry soil, that does not contain as much water as wheat, and yet an acre of such soil, three feet deep, would contain at least 1,000 tons of water.

Soils containing a large quantity of vegetable matter have greater hygroscopic power than any other. Thus, if we recollect right, M. Schübler's interesting experiments show that 100 lbs. of humus will absorb, from an atmosphere saturated with moisture, 12 lbs. of water in 72 hours; a rich garden soil about 6 lbs., a "stiff clay" about 4 lbs., a light clay about 3 lbs., a calcareous sand about ½ lb., and a silicious sand, none at all. The same experimenter found that humus would imbibe 190 per cent. of water, while sand only imbibed 25 per cent. While, therefore, there may be no *chemical* necessity for a large supply of carbon in the soil, it would appear highly probable that in seasons of drouth its presence may be highly useful in keeping the soil moist and supplying the plants with moisture. Its *mechanical* effect, too, on stiff clays may be very beneficial, as is frequently the case in turning under a crop of clover or plowing in a quantity of straw. The nascent carbonic acid evolved during the decomposition of carbonaceous matter, too, may greatly facilitate the disintegration of the mineral matter of the soil, and thus, on some farms, prove valuable. But the fact that Mr. Lawes, during eleven successive crops of wheat on the same soil, found no advantage from the immense amount of carbonaceous matter he has each year added to some of the plots, indicates that the wheat grower need be at no labor or expense to add carbonaceous matter to the soil. Let him aim at the accumulation of *ammonia* in the soil, and he will find that there is no way of obtaining ammonia without at the same time adding all the carbonaceous and mineral matter which the wheat plant needs.

SOILING vs. PASTURING CATTLE.

The *Scottish Journal of Agriculture* contains an experiment on the comparative advantages of soiling and pasturing cattle, which conclusively proves what every one would expect, that an acre of clover mowed and fed to cattle in the yard, will afford more food, or at all events will make more meat than an acre pastured.

On the 10th of July, eight 2 year old steers crosses between the Aberdeen and Short-horn breeds, were divided into two lots, as near alike as possible. The first lot of four were pastured out-of-doors in a field of first years grass, consisting of rye grass (*Lolium perenne*, we suppose) and clover, but principally of red clover. Of this the four cattle eat, from the 10th of July to the 12th of October, 3 acres 2 roods and 5 rods.

The other lot of four were tied up in stalls, and received daily as much of the same description of green cut rye grass and clover as they could eat. During the same period (from July 10 to Oct. 12) the quantity of land required to supply this lot with food, was 1 acre, 2 roods and 35½ rods.

At the commencement of the experiment, each lot was valued at £47, or $225,60. At the conclusion, the first lot, fed in the field, was "computed by competent judges," to be worth £53 15s, or $257, showing a gain of $31,40 for the food of 3½ acres of land. The lot fed in the stalls was valued by the same judges at £55 14s, or $267,60, showing a gain of $42 for a little more than 1½ acres of land.

HINTS ON FATTENING SWINE.

That *pork* has an important place among the products of the country, is shown by our statistics of domestic commerce, and also by the late census, which gave thirty millions as the aggregate of individual porkers in the United States—about ten millions above sheep and twelve millions head of cattle. It is an important item of domestic consumption, salt pork being, in the country especially, the *stand-by* when other meats fail, and highly prized where long-keeping and strength-sustaining food is desired. And its value as sustenance for the laboring man will not be doubted by the experienced, whatever vegetarians and other squeamish people may say on the subject.

For fattening swine upon the farm, it is important to commence early, for the reason that articles of food can be made use of which would otherwise be wasted, and that mild weather is much more favorable to taking on flesh, than cold.

At this season, most farmers have quantities of autumn apples, summer squashes, early potatoes, &c., which would perish or deteriorate sadly by keeping, but are only of considerable value—well worth saving, at least—as food for swine. Boiled or steamed, and mixed with meal, they are well relished, and for a commencement in fattening, answer as well as can be desired. Where apples and potatoes are both used, when boiled in a large kettle, it is a good plan to put in the apples first—three or four bushels of these to one of potatoes, and then cover with the latter—well washed, of course. Then fill with water, and when sufficiently cooked, add enough meal to make a thick, pudding-like mass. The meal will be cooked by thus mixing while hot. Some farmers grind up oats and peas, oats and corn, oats and barley, or shrunken wheat for this purpose.

An experienced farmer gave us the following, as his practice, and with uniform success. He commences early, having the pen open into a small yard adjoining, that the hogs may have exercise, and get at the ground at pleasure. He begins feeding boiled apples, pumpkins, carrots, potatoes, &c., mixing the same with some light mill-feed, which he is careful to measure so that he may gradually increase its richness to the last, when he feeds nothing but corn meal pudding. He is also particular to let the mush stand a half day or so, until the saccharine fermentation commences—which is undoubtedly the most proper stage for feeding. He never fails in making the first quality of pork, and a good deal of it.

We remarked that mild weather was the most favorable to fattening. Food is the fuel for keeping up animal heat, and the less need of expenditure in this respect, the more rapidly will flesh be accumulated. Their comfort should be studied as a matter of economy, for a discontented, restless animal, however much he may consume, will never fatten rapidly.—Their sleeping places should be dry and well littered, and well ventilated, for pure air is of importance to everything that breathes it.

As to the amount of food to be given daily, we think it important to supply all fattening animals with just as much as they will consume without wasting, either by tearing, or by not fully digesting. If no more is given than just enough to support the natural waste of the body—to keep it just up to a certain condition—no fat can be accumulated. Give them as much as they can use, and no more, is the true economy, for the quicker the fattening process can be properly performed, the less the expense in care and material.

To conclude, we would say, commence early, use cooked food—increasing the richness thereof as the process goes on, feed regularly and fully, attend to the comfort of your porkers, and do not forget the manure heap. Make them help pay expenses by making compost for your corn crop.—R.

THE PROVINCIAL FAIR OF UPPER CANADA.

The great Provincial Fair of Canada West was held at London, September 26 to 30, and was everything that the most sanguine anticipated—the weather delightfully fine, the arrangements for the exhibition excellent, and the attendance unusually large. The show of horses, implements, fruits, grain and vegetables, though not quite equal to that at Hamilton last year, was on the whole well calculated to sustain the high position the Society has always occupied.

In "mutton sheep" the Canadians are surpassed only by Great Britain, and the exhibition clearly showed that it is their determination not to be far behind the Mother Country. There were many sheep in the various classes which we believe would have carried off prizes at any of the exhibitions in Great Britain. The show of Leicesters exceeded in number and quality anything we have before seen. We were particularly pleased with those of William Miller, of Pickering. He is an extensive importer and most successful breeder, and exhibited 41 Leicester sheep which, *taken as a whole*, we have never seen surpassed at any of the Fairs of the Royal Agricultural Society of England. He also exhibited four recently imported Cotswolds. The fact that in Mr. Lawes' experiments the Cotswolds increased more for the food consumed than either the Leicester, the South Down, or their crosses, indicates that this breed is deserving of more attention than it has yet received. The Leicester is unquestionably the favorite breed in Canada, and the fact that they are so speaks volumes in their favor. Cowan & Shaw, of Waterloo, exhibited some recently imported Leicesters, which, though only a fortnight off the water, looked exceedingly well. C. A. Jordison, of Port Hope, also exhibited some recently imported Leicester rams. James Dixon, of Clarke, and Geo. Miller, of Markham, also showed *very* superior sheep in this class. Capt. Wm. Shore, of St. Thomas, exhibited 22 good sheep. J. P. Gage, of Wellington Square, showed a very fine two year old ram, weighing 300 lbs. W. L. Ewing, Brantford, exhibited 16 head, the lambs being very fine. James Dixon, Cobourg, showed some very large rams; one yearling especially was of great size and beauty. Francis Johnston, of York, a colored man, also exhibited some very superior sheep. There were many other exhibitors in this class worthy of particular notice, but our space forbids.

In South Downs the show was hardly equal to that of last year. Can it be that this celebrated mutton sheep is losing favor in Canada? Edward Jones, of Stamford, exhibited a fine buck and ewe "from imported stock." (We have since learned that both took the first premium in their respective classes.) The two year old ram which took the President's prize at Hamilton last year, was on exhibition, and is unquestionably a very superior sheep. He is owned by John Spencer, Whitby. Mr. Baker, of Simcoe, exhibited a very fine ewe, imported from Earl Ducies' flock.

There were a few pens of fine wooled sheep, but none worthy of mention.

In Durham cattle the show was, we think, neither so large nor so good as that of last year. A large, white, four year old bull, belonging to John Jarvis, Trafalgar, weighing 2200 lbs., attracted considerable attention.—Mrs. Welford, of Woodstock, also showed a *very* superior bull. "Victor," a two year old, exhibited by Adam Ferguson, of Flamboro, pleased us much. J. P. Wheeler, Scarboro, exhibited a very fine yearling bull. A. C. Hamilton, St. Catharines, James Williams, Dereham, Edward Jones, Stamford, Joseph Lampman, Niagara, and many others, exhibited some superior Durham cattle.

The show of Devons, though good, was as a whole somewhat inferior in number and quality to the Durhams. D. W. Freeman, Windham, Robert Ferrie, Doon, W. H. Locke, Yarmouth, T. Thompson, Adelaide, and some others, exhibited superior animals in this class.

Herefords, in spite of our friend Sotham's able advocacy, are evidently no favorites with the Canadians. There was but *one* on exhibition—a fine bull, owned by the "County of Oxford Agricultural Society."

Geo. Miller, of Markham, and Geo. Rommick, of Cobourg, exhibited some very good *Galloway* cattle, which attracted much attention.

The Ayreshires were well represented.—Richard Thompson, of London, showed a very superior bull. R. L. Dennison, of Toronto, exhibited an excellent three year old bull and a cow, which we have seldom seen equalled.—John Babington, Ancaster, showed some excellent Ayreshires, and J. B. Ewart, of Dundas, exhibited nine head. We are pleased at finding this superior milking breed of cattle so well appreciated in Canada.

In grades, especially Durham grades, and fat cattle, the show was very fine. The show of working cattle was not large, and we saw none worthy of particular mention.

The show of pigs was quite extensive, but not so good as that of last year. The Berkshire and the large Yorkshire and Leicestershire are evidently the favorite breeds. There were but few thorough bred Suffolk or Essex hogs exhibited, and we missed the beautiful Chinese pigs of Mr. H. Parsons, of Guelph. A large two year old Berkshire barrow, so fat that it could not get up without help, and weighing about 900 lbs., attracted much attention. It was owned by Anthony Reoler, of London. C. A. Jordison, of Port Hope, exhibited some fine recently imported Yorkshires.

Last year the show of horses exceeded anything we had before seen. This year, however, as far as we could judge, the show was not nearly so large or so good. We observed one very superior *Clyde* stallion, and on going up to the groom found to our surprise that the "Know Nothings" were not confined to the States. What horse is this? we asked. I don't know, sir. Where does he come from? I don't know, sir. Who does he belong to? I don't know, sir. What number is he? I don't know, sir. The fellow was evidently bent on baffling the "inquisitive Yankee," and he succeeded so well that we suggest a discretionary premium be awarded him as the "best Juck" on the ground.

The show of butter and cheese was small. Hiram Ranny, of Dereham, exhibited several very large cheeses, one of which weighed 1200 lbs. Mr. R. keeps 150 cows. He cuts about 100 acres of timothy and clover hay for them, and grows about 10 acres of ruta bagas and other roots each year. His farm contains 550 acres.

The competition for the $125 prize for the best twenty-five bushels of wheat, and which is retained by the Society for distribution, was much less than usual. The wheat, however, was of excellent quality. There is a large prize offered each year by the Canada Company for the best 112 lbs of hemp and flax. This year there was none exhibited. It is thought that flax culture in Canada is not

profitable, there being little demand for it, except for rope making and coarse bagging.

The show of poultry was large and good, the Shanghtes, Polands, Dorkings, &c., being well represented. Some wild turkies of S. H. PARKS, of London, attracted much observation. They weighed from 18 to 20 lbs. each.

The show of agricultural implements was inferior to that of last year, H. C. WHITE, of Buffalo, being, we believe, the only exhibitor from the States. He showed an excellent assortment of our most approved implements and machines. A clover seed drill or harrow, 10 feet wide, was, in our opinion, one of the most useful machines on the ground. It is manufactured by E. ROCKEY, of Union. A machine similar to this, made by TOMLINSON, of Wolverhampton, has been used for many years in England. We have frequently recommended its introduction into the States. Mr. ROCKEY also exhibited a machine for *crushing* roots. JOHN HELIN, Jr., of Port Hope, exhibited a "post hole borer," and which we were assured worked admirably.

The show of fruit, especially of apples, was exceedingly good, and we were particularly pleased with the arrangement of Floral Hall. In fact the arrangements and general management of the exhibition under the superintendence of the Secretary, GEORGE BUCKLAND, Esq., left nothing to be desired.

NEW YORK STATE FAIR.

THE New York State Fair came off last week at New York city. Owing to bad weather on Tuesday and Wednesday, the entries and attendance were not so large as would otherwise have been the case, but Thursday and Friday were delightfully fine, and the "people seemed fully determined to compensate themselves for the two preceding rainy days." The *Tribune* estimates that from 20,000 to 25,000 visited the grounds on each of these days; and the total receipts amounted to nearly $10,000. A gentleman who attended the Fair informs us that the show of horses, cattle, sheep and pigs, though not so large as in previous years, was select and good; the Mechanical department not equal to former fairs; while the show of fruits, vegetables and flowers was very poor, and the same may be said of the exhibition of grain and dairy products.

A pair of Cashmere goats from North Carolina attracted much attention. They were valued at $1,500. The *Tribune* thinks that Messrs. HUNGERFORD & BRODIE, Adams, Jefferson county, "are entitled to extra notice" for "bringing so far" such "a large lot of superior animals, several of them imported, to help to make up a good show. They have some Ayrshire cattle that need not be beat—they are good enough." It also says: "The show of cattle has never been equalled in good qualities in the State." It also alludes to a "most uncommon lot of mules by JAS. BUCKALEW, Junesburg, N. J. There are 26 which he says will average 15 hands high, all but one pair three years old. Several of them are 17 hands." One of the attractions among the cattle was "a string of working oxen of ten yoke, owned by O. & G. SHELDON, Sennet, Cayuga Co., every one of which is red, and altogether forming a superb team." The arrangements of the Fair appear to have been admirable; the only complaint we have yet heard was in reference to the difficulty of getting from the city to the show grounds. It is thought that thousands were prevented from attending the Fair on this account.

—We trust those who were in favor of holding the Fair in the city of New York—the most inconvenient point in the State for the great majority of farmers to exhibit their products—are satisfied with the result. It appears that instead of a better show, and a large increase of receipts, the Fair did not equal, in either respect, some of its predecessors. We publish elsewhere on this page a list of the Premiums awarded in the Stock Department.

ERIE COUNTY FAIR.

THE annual Fair of the Erie County Agricultural Society took place at Aurora, the 21st and 22d of September. The preparations were most excellent, a fine grove having been selected for stock, implements, &c., with a field adjoining for the horse show.

The show of cattle was excellent, prominent among which were the fine Devons of J. W. HASLIN, and others. The show of fruit was fair, the largest collection being that of H. STILWELL, Esq., of Hamburgh. Some farmers and amateur growers exhibited samples of very choice, well grown fruit. Of grain, vegetables and other things in that class, the show was meagre indeed. The ladies contributed some crocks of excellent butter, and two samples of cheese, also the usual amount of coverlets, quilts, &c. Their own presence was one of the features of the Fair. In this they reflected credit upon the occasion and themselves.

The plowing-match was small, and the plowing of the same character. Not more than two lands out of four were passably done, and to them the committee awarded no premiums, because it was not done to suit their notions. The depth in no case exceeded seven inches; a depth sufficient in a dry season like the one just passed, to ensure a deficient crop. Our farmers have yet to learn that deep and even sub-soil plowing is the very thing to ensure rich fields and, as a consequence, good crops.

The Address, by Rev. Dr. LORD, of Buffalo, was a good production, though far less useful than would have been some practical talk upon the essentials and practice of good farming. The Society does not evidence a great degree of life or prosperity, and never will until it shows a larger inclination to foster the progress that marks the age. No society can expect to prosper with a premium list of some $200, as that does not offer inducements for coming out from the different parts of the county, and leaves the show a local affair, confined to the vicinity in which it is held. The Fair for 1855 is to be held at Potter's Corners, in East Hamburgh. Of this we hope to be able to give a better account. H. C. W.

CHENANGO CO. AG. FAIR.—The Chenango county Agricultural Fair was held on the grounds of the Society, at Norwich, Sept. 27th and 28th. The show of horses, cattle, &c., was much superior to that of previous years; and mechanical genius, as displayed in many of the numberless forms in which it is embodied, was admirably represented. A new feature in our Fair—a very fashionable one at present, however, was a Ladies' Riding Match. As it was the first attempt of the kind, it might not do to criticize too severely, but we may be pardoned for *hoping* that, at future times the equestrianism of our county will be displayed to better advantage, and on finer horses, or—*not at all.*

The address before the Ag. Society, delivered by the Hon. HORACE GREELEY, of New York, on the subject of "Farming," was one of the *very best* to which we ever listened. He talked plainly to plain farmers—not only of their many excellent arrangements and improvements, but of their many mistakes—among the latter he ranked the passion for fencing, against the useless trouble and expense of which he protested. He explained the fertilizing effects of rain water and the atmosphere, as showing the great need and utility of draining and subsoiling. He urged, too, as the first step towards *radical* improvement in the *art of farming*, the necessity of a thorough, practical, scientific education for all who propose agriculture as their profession.—A., *"Valley Home," Chen. Co., N. Y., Oct.*, 1854.

FENNER TOWN FAIR.—The second annual Fair of the Farmers' and Mechanics Association, was held at Fenner Corners, Oct. 4th.—The display of animals was good, and from the large gathering evidenced that great interest was felt in agricultural improvement. The address was by our townsman, RUFUS S. RANSOM. It was evidently the production of a thoughtful mind.

The President, WILLIAM P. BARNEY, followed in some appropriate remarks. He said it was the last occasion he should probably ever have of thanking his fellow citizens for the zeal and energy they had manifested in this their second annual gathering. Many thanks also, he said, were due the ladies, for a very rich display of their skill and industry, far exceeding his highest expectations, but more especially, would he desire to thank them that they had graced the occasion by their presence.

The President was followed by brief remarks from H. A. COOLEDGE, D. BALDWIN and J. W. TAYLOR, and the whole scene was enlivened by a band that knew well how to "discourse sweet music."—M., *Fenner, Madison Co., N. Y.*

THE NEW ENGLAND EXHIBITION OF HORSES will be held at Brattleboro, Vt., on the 17th, 18th and 19th of October, under the auspices of the "New England Agricultural Society."

DO POTATOES IMPOVERISH THE SOIL?—In an excellent article on potato-culture, the *Prairie Farmer* says: "Like corn, the potato does not exhaust the soil. *It gives as much as it takes*, or nearly so." This is quite a new idea to us. Will friend WIGHT be kind enough to give us a little more light on the subject? We always supposed potatoes impoverished the soil as much as any other crop that is grown. We are aware that LIEBIG asserts the contrary, but he came to such a conclusion simply from the knowledge of the composition of the tubers, and not from practical experience or direct experiment.

LIEBIG, many years ago, recommended pinching off the blossoms and balls of potatoes, and mentioned some cases in which it had proved advantageous. At a recent New York Farmers' Club, Dr. WATERBURY stated that he had the blossoms and balls pinched off an acre, and that "it greatly increased the yield and quality, and prevented the rot." Have any of our readers experience in the matter?

FARMING INVESTMENTS.

FEW branches of regular business pay better than farming, with an intelligent application of capital. There are lands, we know, which are not worth improving, in this country of cheap and good land, and these we throw out of the question. But, suppose a farmer has one hundred acres of land capable of becoming productive. Sixty acres of it are in cultivation. Forty acres are in swamp, or unarrivable condition. The good land is worth fifty dollars an acre, the other, ten dollars; but in reality, if reclaimed, the best land on the farm, and the expense of reclaiming it, is but an additional ten dollars the acre. His capital is therefore worth fifty per cent. a year to him for several years, invested in the very swamp which he before considered worthless, besides being a creation of so much productive wealth to him and to the country, as his aforesaid swamp has added to its annual ability to produce a crop.

Draining is another branch of investment to which a large amount of capital may be employed. If to a field yielding twenty bushels of wheat to the acre, or a corresponding quantity of other products, twenty dollars per acre be expended in draining it, so that it will yield thirty to forty bushels with the same cultivation as before, the value of the field is doubled in its profitable capacity for production. And thus with every department of the farm. If better constructed buildings add to the convenience and economy of labor within them, to a greater security and preservation of the crops and the grains, or the better care of the farm stock, so far are they gilt objects for the investment of money in producing revenue, and equally well worthy the farmer's attention.

So also with the planting of orchards, the improvement of farm stock, and the production of various things which but now and then attract the attention of the farmer, in the common way. In short, the farmer would seek no other object for the investment of his money, beyond the improvement of his estate for productive purposes, until he is assured such further improvement will cease to be advantageous. His thought and study, in gainful objects, should be confined to his own business, as the thought and study of those engaged in other pursuits is confined to theirs; and if he loves his employment, as he should do, he will find ample source of investment akin to that of agriculture, which will furnish him abundant opportunities to employ all his spare time and means to advantage.—*American Agricul.*

PATENT CIDER MILLS.

THESE are convenient machines, better perhaps for limited use than almost any other patent of the kind, if people only knew how to manage them. The idea of a man's taking one into his wagon, and traveling over the country to do up the apple grinding and squeezing of any one farmer within a few hours, is all nonsense. The pomace, to yield good cider for any purpose, requires to be exposed to the air in a broad, shallow vat, from twenty-four to forty-eight hours, according to the weather, and turned two or three times with a wooden shovel, to absorb the oxygen of the atmosphere, which ripens, sweetens and colors the liquor, giving it body. It should then be laid up, and pressed slowly, and for the best cider, be twenty four to forty-eight hours under the process. For vinegar, or apple butter, this course of proceeding is equally essential as when the cider is made for drinking. These articles require strong-bodied cider. The chief objection to these modern, fast mills is, the application of iron teeth or graters, in the grinding process. Iron vitiates apple juices, and hence is objectionable, if it remain long in contact with it.—For large cider vats, the old-fashioned wooden *nut-mill*, where it grinds the apple sufficiently fine, or better still, the revolving stone of four or five feet in diameter, moving in a circular vat or trough, and drawn by a horse, are the best cider mills ever invented. *New* things are not always the best, especially in cider-making.—*Am. Agriculturist.*

LADIES RIDING IN YORK STATE.—The recent Fair in Cayuga county, was one of the best county exhibitions that has recently taken place in the State. Some new and pleasant exercises were introduced on this occasion.—Six ladies appeared on the course contending for prizes offered to those excelling in equestrian exercises. One of them rode a spirited steed without saddle or stirrups, and sat her horse so well that the absence of those ordinarily considered indispensables, was not known to the judges. A silver cup, set of spoons, pair of butter knives, silver candlesticks and fruit knives, were awarded to four of the competitors according to their merit, and to the more daring rider, a gold watch, as a special premium.—*N. Y. paper.*

Out in these settlements such riding is not at all extraordinary. Our Scioto girls want no better fun than to go to the fields and spring upon a spirited horse without saddle or bridle, and put him through. Not two weeks ago we took a five mile gallop with one of the handsomest riders in this world, who cares no more for saddle or stirrup than we do for the *flub-dubs* of Paris fashions.—*Ohio. Cult.*

WHEAT IN CALIFORNIA.—Let those who are crowding grain and flour from Chili and the States, know the true condition of this market, and that we have in California *one million bushels* of wheat to spare; that the grain growers will manage their business, and are determined not only to sell as low as the lowest, but become exporters also.—*California Farmer.*

ENGLAND LEARNING FROM AMERICA.—A correspondent of the Boston Chronicle says that the Massachusetts Arms Company, at Chicopee Falls, are now constructing for the British government a complete set of machinery for doing gun-work. The machines are modeled from those at the arsenal in Springfield, which every one who has visited there has seen to their astonishment and admiration.

PREMIUMS AWARDED

At the N. Y. State Agricultural Society's Fair, at New York City, October 9, 1854.

CATTLE.

SHORT-HORNS.—*Bulls*—Three years old and upwards—'Prince Royal,' Thomas Gould Aurora, Cayuga co, $25; 2d, 'Prince Albert,' William Kelly, Rhinebeck, Duchess co, 15; 3d, 'Sir Arthur,' James Meehan, Orleans, Oneida co, 5; best do 2 years old, 'Lafayette,' J H Sherwood, Auburn, Cayuga co, 20; 2d, 'Henry Clay,' Thomas Richardson, West Farms, 10; best 1 year old, 'Ossonni,' L G Morris, Fordham, 15; 2d, 'Majesty,' James Babgate, Fordham, 10; 3d, 'Sir Robert Peel,' Oliver Slate, Jr, Throgg's Neck, Westchester co, 5. Heifer 2 years old—Obadiah Howland, Cayuga co, 20; 2d, Robt R Morris, Westchester co, 10; 3d, H Howland, Cayuga co, 5. Heifer Calf—Robert R Morris, 5.

WORKING OXEN—Best team from any town not less than ten yoke, H G Sheldon, Sennett, Cayuga co, 25. Best yoke oxen, A Van Haysrodt, Kinderhook, Columbia co, 20; 2d, E Gazley, 15; 3d, A M Clark, Fleming, Cayuga co, 5.

STEERS ONE YEAR OLD—Single yoke, Elon Sheldon, 8.

STEERS TWO YEARS OLD—Single yoke, Elon Sheldon, 10.

STEERS THREE YEARS OLD—Single yoke, Mason Salisbury, Ellisburgh, Jeff co, 10; 2d, J N De Forest, Dover, Duchess co, 8.

FAT CATTLE—Best Ox, 4 years and upwards—an extraordinary large animal, supposed to weigh about 3,000 lbs, and is worthy of special commendation, owned by J H Reed, Pittsford, Rensselaer co. Commended. Cow four years and upward, W H Vancott, Victor, Ontario co, 'Commended—B F Weeks, 16 fine fat Steers, No. 401 Houston st, New York; Daniel Barnes, 1 fat Heifer 4 years old, Washington Grove Yard, N Y; B Lawrence, No 41 33d st, N Y, 1 fat Calf.

FOREIGN CATTLE—Short-horn Bull 2 years and upwards 'Astorly,' H & C S Haines, Elizabethtown, N J, Diploma and 15; Heifer or Cow, 'Anna,' H & C S Haines, 15; Alderney or Jersey Bull, do do; 'Pat Ulh,' Roswell S Colt, 15; Alderney or Jersey Cow, do do; 'Lady,' Roswell S Colt, 15; B & C S Haines, for a Short Horn Bull, 'Vane Tempest 2d,' 16 months old—commended.

HORSES.

FOR ALL WORK STALLIONS.—Best Stallion, 4 years and upward, (Thomas Jefferson) Philip Hornbeck, Accord, Ulster county, $25; 2d, (Hambletonian) Thos. J. Jackson, Flushing, Queens Co., 15; 3d, (Nonpariel) John Waldorph, 5; 4th, (Eastern Star) H. H. Vancott, Victor, Ontario Co., Youatt.

ALL WORK MARES AND COLTS.—2d best brood Mare, J. Nichlos, Flushing, L. I., 15; best brood Mare, with foal at her feet, 4 years and upward, Dr. James Babgate, Morrisania, N. Y., 5.

THOROUGH BRED.—Best Stallion, 4 years and upward, (Imported Monarch) L. G. Morris, Fordham, 25; 3d best, (Gray Squirrel) S. R. Bowne, Flushing, L. I., 5; best brood Mare, (Fashion) with foal at her feet, 4 years and upward, L. G. Morris, 25; 2d, Lewis Morris, West Farms, 15.

THREE YEARS OLD STALLIONS AND MARES.—Best Stallion, (plate) W. M. Hyslack, Orange co., 20; 2d, Dr. C. Cilspell, Jr., Ulster co., 10; 3d, (Confidence) Townsend Jackson, Chautauque co., 5; best Mare, L. R. Bowne, L. I., 20; 2d, Wm. Armstrong, Westchester co, 10; commended, thorough-bred brown Mare, owned by L. A Sayre, New York city.

TWO YEARS OLD STALLIONS AND MARES.—Best Stallion two years old, T. Jackson, 15; 2d, R. L. Barnes, Flushing, L. I., 10; 3d, J. Nichols, Youatt; best Mare, E. B. Hollis, 15; 2d, Morris & Baltz, West Farms, 10; 3d, S. Bouton, Brooklyn, Youatt.

MATCHED HORSES FOR ROAD OR CARRIAGE, 16 HANDS HIGH.—Best pair, J. E. Haviland, Hempstead Branch, L. I., 15; 2d, Reuben Murray, Canandaigua, 10. From 15 to 16 hands high—best pair, Clark & Jaroleman, Oneida co., 15; 2d, John Butterfield, Utica, 10; 3d, S. Longstreet, N. Y. city, Youatt; 4th, Caleb Tompkins, Westchester, V. T.

MATCHED HORSES FOR TROTTING ON THE ROAD.—Best pair, E. S. Hewey, N. Y. city, 15; 2d, H. R. Morris, 10; 3d, H. M Whitlock, Westchester, N. Y., Youatt.

GELDINGS.—Best gelding, John Williams, N. Y. City, 10; 2d, L. R. Proctor, Hartwick, Otsego co, 5.

SINGLE MARES.—Best mare, Otis Ormsbee, Glen Cove, L. I., 10; 2d, Wm. Landon, Albany, 5.

SINGLE TROTTING HORSE.—Best single trotting horse or mare, Timothy Jackson, Flushing, L. I., 10; 2d, Reuben Smith, Hoosick, Rens. co. N. Y., 5.

FROM OTHER STATES.—Best Blood stallion 3 years old and upward, James R. Noble, Plymouth, Vt., 15; best stallion all work, T. T. B. Halsey, Stockbridge, Mass., 15; best draught stallion, Cornelius H. Freeland, Patterson, N. J. 15; best pair matched horses not under 16 hands, David Saunderson, Somerville, N. J. 15; above 14 and under 16 hands, Charles C. Scisson, Jersey city, 15; best single horse (mare or gelding) in harness, T. G. Twitchell, Boston, Mass., 10.

JACKS AND MULES.—16 best Jennets, D. McCauley, N. Y. city, 20; 123 best pair of mules, J. L. Jackson, N. Y. city, 15.

COMMENDED.—D. McCauley, 11 pairs mules, two years old. Wm. Dyke, Newton, L. I. 1 team of eight mules.

OUT OF THE STATE, &c.—63 best pair of mules, Jas. Buckelow, Jamesburg, N. J., 15.

COMMENDED.—E. Bishop, Jersey City, one pair of mules 3 years old.

SHEEP.

FAT SHEEP.—*Long Wooled*—Two years old and upward.—E Gazley, Clinton, Duchess co, $5; 2d, E Hazles, Clinton, Duchess co, 3; 3d, E Gazley, Clinton, Duchess co, Morrell Shepherd. *Middle Wooled*—Under two years—E. Gazley Clinton, Duch. co, 5; 2d, O. Howland, Owasco, Cayuga co, 3; 3d, H Howland, Owasco, Morrell Shepherd.

LONG WOOLS—*Bucks*—Two years old and upward—Hungerford & Brodie, Adams, Jefferson co, $10; 2d, Hallock Sherman, Duchess co, 5; 3d, J C & L W Rathbun, Otsego co, 3. Under two years—Hungerford & Brodie, Adams, Jefferson co, 10; 2d, J C & L W Rathbun, Otsego co, 5; 3d, Thos H Jackson, Otsego co, 3. *Five Ewes*—Two years and upward—Hungerford & Brodie, Adams, Jefferson co, 10; 2d, J C & L W Rathbun, Otsego co, 5; 3d, Andrew Vail, Duchess co, 3. Under two years—Hungerford & Brodie, Adams, Jefferson co, 10; 2d, J C & L W Rathbun, 5; 3d, S A Curtis, Columbia co, 3. Three Buck Lambs—Hungerford & Brodie, Jefferson co, 5; 2d, Andrew Vail, Duchess co, Morrell Shepherd. Three Ewe Lambs—Hungerford & Brodie, 5; 2d, J C & L W Rathbun, Morrell Shepherd.

MIDDLE WOOLED.—*Bucks*.—Two years and upward—Lewis B Morris, Fordham, Westchester co, $10; 2d, Daniel B Haight, Dover Plains, Duchess co, 5; 3d, Oscar Brees, Blooming Grove, Orange co, 3. Under two years—Lewis G Morris, Fordham, Westchester co, 10. *Five Ewes*—Two years and upward—Daniel B Haight, Dover Plains, Dutchess co, 10; 2d, L G Morris, Fordham, Westchester co, 5; 3d, Edward Wait, Montgomery, Orange co, 3. Under two years—L G Morris, Fordham, 10; 2d, Daniel B Haight, Dover Plains, Duchess co, 5. Three Buck Lambs—L G Morris, Fordham, 5; 2d, Daniel B Haight, Dover Plains, Duchess co, Morrell Shepherd. Three Ewe Lambs—Daniel B Haight, Dover Plains, Duchess co, 5; 2d, Lewis G Morris, Fordham, Westchester co, Morrell Shepherd.

MERINOS.—*Bucks*.—Two years and upward—J Haswell, Hoosick, Rensselaer co, $10; 2d, E G Cook, Belleville, Jefferson co, 3. Under two years—Reed Borrell, Bordell, Tompkins co, 10; 2d, J Haswell, Hoosick, Rensselaer co, 5; 3d, do, do, 3. *Five Ewes*—Two years and upward—J Haswell, Hoosick, Rensselaer co, 10; 2d, do, do, 5; 3d, R Burrett, Burlett, Tompkins co, 3. *Five Ewes*—Under two years—J Haswell, Hoosick, Rens co, 5; 2d, J Haswell, Hoosick, Rens co, 3; 3d, O Howland, Owasco, Cay co, 3. Three Buck Lambs—R Burrett, Burlett, Tomp co, 5—Three Ewe Lambs—R Burrett, Burlett, Tomp co.

SAXONS—*Bucks*—Seven years and upwards—J Haswell, Hoosick, 5; 2d, under two years and upward, J Haswell, Hoosick, 3. *Five Ewes*—Two years and upward—Walter Wakeman, North East, 10; 2d, Isaac Merrill, Hart's Village, Dutchess co, 5; 3d, J Haswell, Hoosick, Rens co, 3. Under two years—Wm Sheldon, N East, 10; 2d, Walter Wakeman, N East, 5; 3d, Isaac Merritt, Hart's Village, 3. Three Ewe Lambs—J Haswell, Hoosick, Rens co, Morrell shepherd.

CROSS BREED—*Bucks*—Two years old and upward—Walter Wakeman, N East, Duchess co, $10; 2d, Joseph Haswell, Hoosick, Rens co, 5; 3d, E G Cook, Belleville, Jeff co, 3. Under two years old—Jacob Haight, Dover Plains, Duchess co, 10; 2d, Walter Wakeman, North East, Duchess co, 5; 3d, E G Cook, Belleville, Jeff co, 3. *Five Ewes*—Two years and upward—2d, J. Haswell, Hoosick, Rens co, 5; 3d, O Howland, Owasco, Cayuga co, 3. Under two years—2d, Joseph Haswell, Hoosick, Rens co, 5; 3d, Daniel S Curtis, Canaan Centre, Columbia co, 3. Three Buck Lambs—Walter Wakeman, North East, Duchess co, 5; 2d, Joseph Haswell, Hoosick, Rens co, Morrell Shepherd. Three Ewe Lambs—2d, O Howland, Owasco, Cayuga co, 5; 3d, E G Cook, Belleville, Jeff co, Morrell Shepherd. Shepherd's Dog—Lewis G Morris, Fordham, Westchester co, 5; 2d, Joseph Burr, New York, Morrell Shepherd. Discretionary—Five Ewes—E G Cook, Belleville, Jeff co, 3. Three Buck Lambs, fine wool—Walter Wakeman, North East, Duch co, 5.

FOREIGN SHEEP.—LONG WOOLED—*Bucks*—R A Alexander, Woodburn, N Y, $10. Five Ewes—Ralph Wade, Cobourg, C W, 10.

MIDDLE WOOLED.—*Buck*—Geo Harishorn, Rahway, N J, $10, Five Ewes—Geo Harishorn, 10. Three Ewe Lambs—Geo. Harishorn, Vol Trans.

MERINOS.—*Buck*—Geo Campbell, Westminster, Vt, 10. Five Ewes—Geo Campbell, 10.

SWINE.

LARGE BREED.—*Boars*—Two years old and upward—(Suffolk) Francis Fellner, 45th st. New York, $10; 2d—(Berkshire) Edward Waite, Montgomery, Orange co, 5. One year old—(Lincolnshire) Samuel Love, 53d st, 10; 2d, (Essex boar Uncle Tom) W P & C S Wainwright, Rhinebeck, Duchess co, 5. Six months and under one year—(Suffolk) Francis Fellner, New York, 5; 2d, (Essex) Wm Love, New York, 3. *Breeding Sow*—Two years old and upward—(Lincolnshire) Saml Love, New York, 10—One year old—Hungerford & Brodie, Adams, Jeff co, N. Y, 10; 2d, (Berkshire) Saml Love, 5. *Sows*—Six months and under one year, (Cheshire)—Saml Love, 5; 2d, (Suffolk)—Wm Love, 52d st, New York, 3. *Pigs*—Not less than five under ten months—Wm Love, 5.

SMALL BREED.—*Boars*—Two years old and upward (Berkshire)—Lewis G Morris, Fordham, Westchester co, 10; 2d (Suffolk) Wm Isley, 132d st, New York, 5. One year old, (Suffolk)—P T Barnum, Bridgeport, 10; 2d, (Suffolk) Lewis G Morris, 5. Six months and under one year (Suffolk)—Geo W Wilson, Malden, Mass. 3; 2d, (Suffolk)—Wm Isley, 132d st, New York, 4. Breeding Sow—Two years old and upward (Suffolk)—P T Barnum, 10; 2d, (Suffolk)—Wheeler Hall, 35th st. N. Y., 5. Best breeding sow 1 year old (Suffolk)—L. G. Morris, 10; 2d, (Essex)—Wm. Isley, 132d st. N. Y. Best sow 6 months and under one year (Suffolk)—D. B. Haight, 3. Best lot of pigs not less than 6, under 10 months (Essex) W. P. & C. S. Wainwright, 8; 2d, Thomas Cutting, Rossville, Staten Island, 2.

The committee on Swine would recommend discretionary premiums to the following persons:

Samuel Love, N. Y. for a fat hog and Lincolnshire boar. Wheeler Hale, New York city for a Suffolk sow and seven pigs. John M. Sherwood, Auburn, for a Suffolk sow and pigs. Daniel B. Haight, Dover Plains, for Berkshire swine. L. G. Morris, for a fine display of swine. W. Simpson, West Farms, for striped pair of pigs. William Isley, N. Y. city, for good display of Swine. Lewis Livingston, Canaan Centre, for Suffolk boar and 21 pigs. Sheffman Griswold, Spencertown, for Essex boar. W. P. & C. S. Wainwright, for display of Essex swine. Edward Waite, Montgomery, Orange Co., for Berkshire swine.

POULTRY.

DORKINGS.—Best lot of white Dorkings, not less than three, one Cock and two Hens, S. D. C. Van Rensselaer, Claverack, Col. Co., $5; best lot gray or speckled, Samuel Fell, Westchester Co., 3; 2d, S. Fell, 2; best lot of black Jarz, H. Johnson, Patterson, N. J., 3; best lot Golden Poland, H. Johnson, Patterson, N. J., 3; 2d, H. Johnson, 2; best lot Silver Poland, H. Johnson, 3; 2d, H. Johnson, 2; best lot Bolton Grays, Samuel Fell, 3; 2d, H. Johnson, 2; best lot Sumatra Pheasants, Wm. H. Hibbard, N. Y., 3; best lot Mexican Pheasants, Fordham Morris, 3.

CHINESE.—Best lot buff or red Shanghai, Geo. Anderson, Albany, $3; 2d, W. E. Haxton, Beekman, N. Y., 2; best lot white do., Geo. Anderson, 3; 2d, Cummings & Haight, Rochester, 2; best lot grey do., H. S. Ballou, Blackstone, Mass., 3; 2d, H. S. Forman, Lonsdale, R. I., 2; best lot black do., L. Livingston, 3; 2d, H. Johnson, 2; best Hemiloique, G. Anderson, 3; 2d, H. Johnson, 2; best Gold-lace Bantams, H. S. Freeman, 3; 2d, H. S. Freeman, 2; best lot silver-lace Bantams, H. S. Freeman, 3; best lot Java Bantams, H. S. Freeman, 3; 2d, Cummings & Haight, 2; best lot African Bantams, H. Johnson, 3; 2d, W. Simpson, West Farms, N. Y., 2; best lot any other variety, Fordham Morris, Westchester county, 3; 2d, Edward Haight, Westchester, 2; best lot native, not less than six, L. R. Morris, New York, 3.

TURKEYS.—Best pair of Turkeys, O. Howland, Owasco, Cayuga county, $3; 2d, Cummings & Haight, 2; best pair wild Turkeys, Cummings & Haight, 3; 2d, O. Howland, 2.

DUCKS.—Best pair Muscovy, H. Johnson, 3; 2d, Wm. Simpson, Jr., 2; best pair black Cayuga, R. H. Morris, 3; 2d, Fordham Morris, 2; best pair Topknots, E. Haight, 3; 2d, H. Johnson, 2; best pair common, Lewis M. Brown, West Farms, 3; 2d, T. Frost, New York, 2.

GEESE.—Best pair common, H. Johnson, 3; best pair Bremen, H. Johnson, 3; 2d, Wm. Moore, N. Y., 2; best pair China, H. Johnson, 3.

GUINEA FOWLS.—Best lot, C. B. James, Westchester, 3.

PIGEONS.—Best and greatest variety of Pigeons, F. M. Rodman, West Farms, $3; 2d, J. L. Dean, N. Y., 2; best exhibition of poultry owned by exhibitor, H. Johnson, 10; 2d, G. W. Cummings, Rochester, 5.

RABBITS.—Best pair large eared Rabbits, S. Fell, West Farms, $3; 2d, S. Fell, 2; best pair common Rabbits, R. Morris, 3; 2d, John Johnson, 2.

WEIGHT OF SEASONED WOOD.—The following table shows the weight of a cord of seasoned wood:

	Lbs.
White ash	3460
Beech	3223
Chestnut	2333
White elm	2892
Scaly bark hickory	4479
Pig nut hickory	4241
Red heart hickory	3703
Iron wood	3218
Hard maple	2879
Soft maple	2569
White oak	3821
Fin oak	3339
Red oak	3254
Chestnut oak	3030
Pine	1900
Lombardy poplar	1754

Orchard and Garden.

NEGLEY'S SEEDLING CUCUMBER.

This very excellent cucumber was originated by Mr. Jas. S. Negley, of Pittsburg, Pa. It is of medium size, rather short, very regular and fair in shape, and unsurpassed for productiveness. The writer received a sample of the seed from Mr. Negley, last Dec., who wrote concerning it:

"It is decidedly the best cucumber among ten sorts that I cultivated. One vine of it produced 56 of the most beautiful cucumbers for the table one ever saw, up to the 26th of Sept. when the frost killed the vine, which then had upon it upwards of 100 small and half-grown cucumbers. I consider it the very best for forcing or family use."

The present season has been quite unfavorable to vines, and my cucumber vines, especially, suffered severely from the drouth; but from one season's experience with it under such untoward circumstances, I am satisfied Mr. Negley has not overdrawn the truth. It proved with me superior to all other varieties that I have experimented with, some of which have been highly recommended. T. E. W.

The Strawberry Culture.—A Complete Manual for the Cultivation of the Strawberry; with a Description of the Best Varieties. Also, Notices of the Raspberry, Blackberry, Currant, Gooseberry, and Grape; with directions for their cultivation and the selection of the best varieties. By R. G. Pardee. New York: C. M. Saxton.

Mr. Pardee has for some years paid particular attention to the culture of strawberries and other garden fruits, and the thousands interested in the subject will be glad to get in this condensed form, the result of his researches. In addition to his own experience, we have, in an appendix, letters from some of the most successful cultivators of the strawberry and other fruits, giving many observations of value. We believe the work was wanted, and will be well received by the public.

TRANSPLANTING TREES IN THE AUTUMN.

"Do you approve of fall planting?" is a question asked us every day. Our answer is, yes, under these circumstances:

1st. When the ground is of such nature and in such condition that water will not lodge around the roots of trees during winter. To plant trees in holes sunk in stiff, tenacious soils, is a certain method of killing them.

2d. The trees should be *perfectly hardy*—All delicate or half-hardy trees should invariably be planted in the spring. If it be necessary to take them up in the fall, they had better be laid in by the roots in a *dry soil* sheltered from the cold, cutting winds, and, if necessary, protected with boughs of evergreen, or something of that nature.

3d. We do not approve of planting evergreen trees in the fall, unless the very hardiest sorts, and that quite early, say in September or first of October, in time for the trees to re-root, partially, before hard frosts; and they should be sheltered from the sun and wind by a thick screen of evergreen boughs well secured around them.

4th. Plant trees *early*—as soon as circumstances will permit after the wood is ripe.—Don't wait till the leaves fall, but cut them off, being careful not to injure the buds. Late planting, however, if well done, may be equally successful. We transplant any time most convenient, between the first of October and first of May. Last winter, in December, we planted several hundred of specimen trees, from one to six years old, and lost not over two or three in the whole. Many of the bearing trees, notwithstanding the drouth, have borne and ripened fine specimens of fruit.

5. Secure all trees from being blown about by the winds, and mulch with half-rotten manure or leaves three or four inches deep.

Asparagus, rhubarb, gooseberries, and currants, should all be planted in the fall, and as early as possible. Also, hardy bulbs, such as hyacinths, tulips, narcissus, crocus, crown imperials, and lilies. It is also the best season to top-dress and renovate neglected trees of all sorts,—to make new walks and repair old ones—to lay down turf, and perform such operations as grading, draining, trenching, &c., incident to the formation of new gardens, lawns, &c. Our springs are short, and hot summer weather very often comes too soon. It is therefore well to make a good use of every hour between this time and the freezing of the ground. —*Horticulturist.*

The Peach Trade of Monroe County.—For fruit and fruit trees, Monroe county is the most celebrated in the United States. The quality and variety of both, may, indeed, be called world-wide. This season the amount and value of peaches shipped at Charlotte is as follows: 17,097 baskets by the American line of steamers for Oswego, Sacketts Harbor, and Ogdensburgh, and 3,138 baskets per the Maple Leaf for Canada. In addition to this, probably an equal amount went to the eastern markets. A gentleman named Shepherd, bought and sent by railroad to Boston and New York, many thousand baskets. He had his agents stationed all along the lines from Canandaigua to Boston, who dispersed them to colleagues in all directions. From the extreme hot weather ripening them so fast, the early varieties were crowded so rapidly into the market that the price was much lower than usual, but for the last two weeks it has been sufficiently remunerating to all concerned in the trade. The average price per basket during the season will be about 62 cents.—*Rochester Daily Union.*

STORING WINTER VEGETABLES.

Next to the growing, the proper preserving of winter vegetables, claims our attention. It is possible that so far as sorts and growth are concerned, the stock may be unexceptionable, which, when wanted for the table, they may be, if roots, dried and shriveled up—if the cabbage tribe, rotten. This is all for the want of proper storing. A good dry cellar is the best place for storing roots, such as carrots, beets, ruta bagas, parsnips, scorzonera or oyster plant, and turnips. If stored after the following manner, they will come out as wanted, as plump as when taken out of the ground.

The tender, such as carrots, beets and scorzonera, require taking up as soon as the leaves exhibit a yellow appearance, or before any very sharp frost, while parsnips may remain longer, as no frost injures them; in fact, except for use during hard weather, many leave them in the ground all winter. In taking up, care should be taken to get them out with the roots entire, or they are much more liable to rot, while some, as the beet, are materially injured in the cooking if mutilated. The tops should be trimmed off just above the crown, and the roots allowed to become dry before storing.

Procure some sand, which should be pretty dry, and lay a thin layer over the place the roots are to occupy. Now lay the roots evenly over this, placing a row all around the outside with the crowns outwards. Place on sand sufficient to fill up all cavities and just cover the roots, and so on, alternate roots and sand, till the whole is completed. They should not, however, be laid up to a greater height than about three feet.

Cabbage may be preserved in the cellar and in the open ground—the former for use during winter—the latter, after the frost breaks.—Take a sheltered part of the garden, and open a trench, in which lay the cabbage, bottom upwards; take out the next trench and lay on these, and so on. A few boards or a little straw should be sprinkled over them in hard weather.

Cauliflower and Broccoli, that have not headed before hard weather, should be carefully taken up, and laid in mold in the vegetable cellar or shed. In this way, this luxury may be had a good part of the winter.

Celery, all except the very latest crop, should, just before the ground becomes hard, be lifted and placed in sand in the cellar, tops upwards, a little slanting. This will be in use the greater part of the winter. The latest crop may remain in the ground well covered with straw.—Edgar Sanders, in *Country Gentleman.*

WILD PLUMS IN IOWA.

We have before spoken of the wild fruits of this region; a few days since, we took a half days ramble to look for plums up country, crossed Little Pigeon, and the Big Pigeon below William's mill, and then struck out for the bluff to the right, where we found the bushes loaded with most excellent ripe and delicious fruit, the ground was also covered, from which the hogs were making a rich repast. In the streams and little lake near by there were numerous ducks, geese, and swans, that made the water alive; in the depths below were the finest fish that swim in fresh water, only wanting the crafty hook of the fisherman to grace the table and tickle the palate of the epicure; quails and prairie chickens were everywhere adjacent to the farms in abundance.

Yesterday, we received from a lady of our city, a dish of the largest and most delicious wild plums we have ever seen. We had the curiosity to measure a number, each of which was four inches in circumference. The cultivated varieties of the east will hardly match these.—*Council Bluffs Bugle.*

PRESERVATION OF PLANT STICKS.

One frequent complaint I have heard made by exhibitors is, that the constant tying and untying of plants, rendered necessary by the rotting of the sticks in pots, takes up much time, and gives much additional trouble. I myself have experienced this, and consequently, was induced to try some experiments as to the best means of preserving the sticks. Having tried various preparations, a solution of gutta percha among the number, I find what painters call knot-varnish (or what they put on knots before painting the wood) to be by far the best; even small sticks, not so thick as ordinary potholders, have after 12 months' use, appeared as sound as on the day they were put in. I simply dip the stick into a bottle of the varnish, and let it drain off. I think, on further trial, it will be found to bear out the above statement. The sticks of course, when dry, can be painted any color required: perhaps, however, some of your readers may know something even better than this; if so, I hope they will favor me with their experience in the matter.—*London Gardener's Chronicle.*

Cranberries on High Land.—Mr. Elias Needham, of West Danvers, has shown us some cranberries grown on high land, which are of good size, and which, he says, he produces, with good success, having raised some one or two hundred bushels a year and selling them for $3 and $4 a bushel. We have heard his experiments favorably spoken of by his neighbors, and can have no doubt but that he finds an ample reward in the crops for all cost and labor. Here, then, is the example; why cannot others copy it, and produce this wholesome and palatable food, so that it shall become common on every table?—*N. E. Farmer.*

Gathering Winter Fruit.—Winter apples and pears should be carefully picked from the trees by hand, packed up in barrels, with buckwheat or other chaff, and stored in a cool dry room, in which the temperature ranges as near as possible, just above the freezing point. If such a room should eventually become too cold, put them in an airy, dry cellar, sufficiently cool as not to allow them to freeze.

HISTORY OF THE PLUM TREE.

The common domestic cultivated plum is believed to be indigenous to the south of Russia, Caucasus, the Himalayas, and to many parts of Europe. In England, and in some parts of the United States, it is sometimes found in hedges; but never truly wild. This species and many of its varieties are cultivated for ornament, or their fruit, in all the temperate countries of the habitable globe. Faulkner, in his "Kensington," makes the plum a native of Asia, and an introduction into Europe of the crusaders. Gugh, in his "Topography," says that Lord Cromwell introduced the "Perdrigon plum" into England in the time of Henry VII.

The introduction of this tree into the British North American colonies, probably dates back to the early period of their first settlements. The stones were ordered from England by the "Governor and Company of the Massachusetts Bay in New England," in 1629.

Several valuable and interesting varieties have originated in this country, among which the Bolmar or Washington stands conspicuous. The parent tree is said to have been purchased in a market in New York, about the end of the last century. It remained barren for several years, till, during a violent storm of thunder, the entire trunk was severed to the earth by lightning, and destroyed. The part remaining in the ground afterwards threw up several vigorous shoots, which were allowed to remain, and finally produced fruit. Trees of this variety were first sent to England in 1819, to Mr. Robert Barclay, of Bury Hill; and several others were sent to the London Horticultural Society in 1821, by Dr. Hoosack, of New York.—*Patent Office Report.*

The Nutmeg Tree.—At Bird's Valley and Eldorado canyon this valuable tree is found in its greatest perfection. Trees are found here from eighteen to twenty-four inches in diameter, and full of the fruit, which is contained in a covering like the rooting of the English walnut. Before ripe it is soft and quite stringent, but when mature the covering opens and the nutmeg drops; the berries or nut ripens at various periods—upon the same tree may be found ripe and green fruit.

The ripe nutmeg is of the same form, and is as fully aromatic as the fruit from Sumatra; the foliage is like the pine or the hemlock; each leaf having, however, a sharp thorn or briar. The fruit grows in clusters similar to the cherry, and is indeed quite ornamental.—This tree can be easily grown, and will be quite an acquisition; and we trust, ere long, to see it generally cultivated.—*California Farmer.*

Domestic Economy.

RECIPES.

One of the best housekeepers in Morristown N. J., sends us the following:

Mount Savage Bread.—Take one large table-spoon of yeast, put it to soak in a half-pint of warm water at four o'clock P. M., the day before you bake. When soft, mix it with wheat flour the consistence of a thick batter.—Let it stand until light. Take half a dozen medium sized potatoes, boil and rub them through a cullender. Take one quart of warm water and mix your sponge, adding the potatoes, and some salt, making a thick batter. Let it stand over night.

In the morning add one egg well beaten, one and a half large spoons of pulverized white sugar, and a piece of butter the size of a black walnut. Knead it well and let it rise. When light, mould it and let it rise again; repeat the same two or three times, the oftener the better. Bake in sheet-iron pans, 11 by 14 inches, and 3 inches deep, making six loaves in each pan. When you take it from the oven, rub the top of the loaves with butter in a cloth.

Mount Savage Yeast.—Take a double handful of hops, boil in two quarts of water.—Strain it upon some wheat flour sufficient to make a thick batter so that it will rise.

When light knead in corn meal enough to make it stiff as dough; let it rise, then mould it twice. Then break it up fine and let it dry, rubbing it daily as it grows dry, till it is nearly as fine as corn meal. Keep in a dry place, and where it will not freeze. Do not put in any salt.—*American Agriculturist.*

Peach Leaves for Yeast.—*A Substitute for Hops.*—Take a double handful of peach leaves and boil down strong to about a pint of water. Strain out the leaves and stir in the flour while hot as with meal in hop yeast. When cold, for the first batch add a hop cake and let it stand till it becomes light before using. Afterwards no hops will be required. If the yeast be sour add a little saleratus to the bread in mixing. A tea cup of yeast suffices for eight loaves. The leaves may also be dried in the fall and used through winter.—*Ohio Cultivator.*

Sugar Pie.—Cover your pan with good paste, spread over it a layer of sweet butter, then sugar enough to cover the bottom; then pour in a half pint of rich cream, in which a table spoonful of flour has been first stirred, and it is ready for the oven.—*Ohio Cultivator.*

A Winter Cake.—Take half cup of butter, two of sugar, three of flour, and one of thick, sour cream, (instead of eggs) get it ready for the oven in the usual way, then sprinkle and stir in a tea spoonful of soda, bake it slow.

To Bleach Straw.—Straw may be bleached by putting it in a cask into which a few brimstone matches are placed lighted. The same effect may be produced by dipping the straw into chloride of lime dissolved in water.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending Oct. 3, 1854.

Abner Chapman, Fairfax, Vt., improvement in paddle wheels.

Charles M. Cresson, Philadelphia, improvement in the form of gas retorts.

Victor Beaumont, New York, for improvement in steam gauge.

Thomas Batchelder, Candia, N. H., machine for manufacturing frames for wood saws.

Patrick S. Derhu, Reading, improvement in brick machines.

Richard Deering, Jr., Louisville, improvement in circular stone saws.

Stephen J. Guhl, New Haven, improvements in warming houses by steam.

R. L. Howes, Worcester, improvements in drying cloth.

Thos. J. Harris, Jr., New York, improvements in fastenings for garments.

J. Kimbell, Zanesville, Ohio, improved dumping car.

J. Y. Leslie, Cincinnati, improvement in knitting machines.

Jacob J. Lownds, New York, improved pen and pencil case.

Francis H. Smith, Baltimore, improvement in brick machines.

Wm. H. Robertson, Hartford, improvement in machines for dressing stone.

Wanton Rouse, Taunton, improvement in self-acting mules.

Andrew Rankin, Newark, improvement in making hat bodies.

Silas S. Putnam, Boston, improvement in curtain fixtures.

Samuel Peck, New Haven, improvement in the manufacture of daguerreotype cases.

Wm. Palmer, New York, improvement in apparatus for starting railroad cars.

Zachariah M. Paul, Alexandria, La., improvement in brick machines.

Spencer Moore, Central Bridge, N. Y., improvement in the feeding hoppers of threshers and separators of grain.

John Mable, English Neighborhood, N. Y., improved pen and pencil case.

Wm. C. McKee, Philadelphia, improvement in railroad drawbridge, and switch telegraph.

Benj. B. Webster, Boston, improvement in musquito curtains.

Ervin B. Tripp, Concord, improved printing press.

Richard A. Tilgham, Philadelphia, improvement in processes for purifying fatty bodies.

Joseph Thatcher, Philadelphia, improvement in looms.

John Wilcox and S. H. Whitridge, Philadelphia, improvement in sewing needles.

John E. Grant, Charleston, Mass., assignor to Cyrus Carpenter and Augustus D. Shaw, Boston, Mass., improvement in hot air furnaces.

Levi Van Hoesen, of New Haven, assignor to the New Haven Iron Railway Company, New Haven, aforesaid, improvement in piano forte stools.

RE-ISSUE.

Isaac M. Singer, New York, improvement in sewing machines. Original letters patent dated August 12, 1851.

PLANING AND JOINTING SHINGLES.

Sawed shingles are far less durable than those which are made with a smooth surface, therefore, although it might be an easier and a more rapid method of producing shingles to saw them out with circular saws, the superiority of the planed or shaved shingle naturally directs attention to the best way of making them by machinery. In order to produce the best quality of shingles, John J. Speed, Jr., and John A. Bailey, of Detroit, Mich., have made an improvement for planing and jointing them, for which they have taken the proper measures to secure a patent. It consists of two reciprocating frames, provided with cutters and a feeding bar, which gives an accelerated motion to the shingles, while passing between the cutters. One set of cutters plane the face, and others the sides of the shingles, which are first reduced to rough shingles from blocks, in any proper riving machine, and then submitted to the planing action in the improved machine. The planing of shingles is not a new thing; the present machinery is only claimed to be an improvement over plans in use.—*Scientific American.*

House Painting.—We have repeatedly called the attention of the readers of the Farm Journal to the fact, that painted surfaces exposed to the weather should in all cases possible be painted in the fall, winter or early spring. The best time in the year is in November and December. This, experience has abundantly shown.

On exposed surfaces, painted in the warmer portions of the year, it will be found that the oil has commenced "leaving the paint" in one, two or three years, according to the quality of the materials used. In passing the hand over it portions will adhere, and every rain will carry off these loose particles, so that in a very few years the paint if not removed, will all disappear. On the other hand, if reasonably good material be used, and put on in the months indicated, the paint will last twice or thrice as long, thus saving the cost of one or two renewals, to say nothing of the better preservation of the wood.—*Farm Journal.*

Suspension Bridge.—The Suspension Bridge over the Niagara for the passage of locomotives, will be completed in December. The bridge is to be swung twenty feet over the present carriage bridge, and when completed will be one of the most magnificent structures in the world. There are to be three different gauges. That of the Great Western is five feet six inches: that of the Niagara Falls and Elmira railroad, intersecting the New York and Erie road is six feet; and that of the N. Y. Central road, via Lockport and Rochester, to New York, and the Buffalo and Niagara Falls road is four feet eight inches. It is in contemplation to lay down a track the same width of the Great Western railway, from the Suspension Bridge to Buffalo, so that cars will run from Windsor, opposite to Detroit, directly to Buffalo.

FAST WOOD-SCREW MACHINE.

Mr. George F. Wilson, of Providence, and Mr. James M. Wiley, of Olneyville, R. I., are the joint inventors of a machine for making wood-screws which equals in rapidity of execution four of the best machines now employed in that branch of manufacture. The machine is termed the Wood-Screw Rotary Machine, all the principal movements being of a continuous rotary character. Wood-screws, termed screw-nails by some English authors, are usually completed in three machines, one only of which is termed a "wood-screw machine." The first takes wire from the coil and transforms it into "screw-blank" by motions closely analagous if not identical with those of the common riret-machine. Another machine saws a shallow score across the top of the head, while the main machine, on which all the study and inventive skill is necessarily bestowed, seizes the blank and cuts the proper thread thereon. The thread of a wood-screw is all produced by removing the metal between, there being none of the metal squeezed up as is done by the ordinary dies of the machine-shop so as to make a screw of greater total diameter than the original wire. The blanks being fed in by self-acting mechanism, are successively caught by a pair of jaws in a revolving chuck, held firmly by the head, and compelled to rotate steadily in one direction, while a properly shaped tool is repeatedly pressed against its side and moved toward the point. Several reciprocating movements are thus necessary, even with a sharp and keenly adjusted tool, before the thread is sunk to the required depth, and the large amount of "gim-crackery" employed renders the machine far more "ingenious" than simple or efficient. Such, although usually concealed with some care from the gaze of the uninitiated, is believed to be the method by which these useful instruments are generally prepared, and it is certainly that employed in the new machine, excepting with regard to the cutting tool and its movements. The new machine, like the older varieties, completes the deep spiral crease only by a repetition of shallow cuts, each scraping deeper than its predecessor—one main point of difference lying in the fact that the new machine carries the tool, or rather a series of tools, on a slowly-revolving horizontal wheel—the movement being continuously rotative. This arrangement not only saves the time otherwise lost in the return motion, but avoids the employment of much complex mechanism. A point of equal or perhaps greater importance is gained in dividing the destructive effect on the edges of the cutters between eight tools, (that number being employed in each series,) so that, other things being equal, this machine, once adjusted, would remain sharp eight times as long as the other. The simplicity and compactness of the rotary, however, allows four machines, so to speak, to be combined in one with decided advantage, so that one of the ponderous constructions, which are some four feet square and three feet high, throws out the finished article with four times the rapidity, and remains in order, from the principles of its construction, something like eight times as long, as the older devices.

The machine cannot yet be said to be completely in operation—one only, and that one not entirely perfect, having been in motion at the period of our visit. There can be little doubt, however, that this simple, although, at the same time, compound machine is not only a decided improvement over all the devices before proposed for the purpose, but one which will so far facilitate the manufacture of this admirable fastening as to cheapen and diffuse it to a still greater extent than at the present moment.

Sawing Machine.—The vast timber interests of our country is evidenced by the great and universal attention which has been devoted to timber cutting machines of every description. To the many various improvements in sawing machinery which have already been made, Pinney Youngs, of Milwaukee, Wis, has added another, for which he has taken measures to obtain a patent. It relates to sawing boards direct from the log, and consists in the use of two pairs of saw guides, attached to vibrating levers—one pair at each end—in such a manner that the guides may be brought in contact with the saw (a circular one) at either end. When one pair of guides is brought in contact with the sides of the saw, the guides at the opposite ends of the levers will be thrown out from the saw at the period when the carriage has moved to the end of its way and receives its return motion, whereby it is enabled to cut both ways—during both the forward and back motion of the carriage. He has also applied a combination of devices for setting the log correctly and quickly.—*Scientific American.*

Gas.—Two or three of the principal hotels and as many theatrical establishments in New York, manufacture the gas for their own consumption, and thereby effect a great saving in expense. The St. Nicholas has had its new gas apparatus in operation about four weeks, and the saving is equal to a hundred per cent. Previous to the enlargement of that establishment, the gas cost something like $30 per night. The number of gas burners has been increased to 2,100, and the cost per night is not far from $18. It has not exceeded this sum. The apparatus is very simple. The gas is manufactured from rosin, after the old style, and is of excellent quality.

Novelty in Steamboat Machinery.—A new steamer, placed upon the Clyde, has her machinery so constructed that she may be made to go laterally or diagonally, to go back, to go ahead, to whirl round in her own length like a pivot, in a word, to perform every manœuvre or gyration that possibly could be desired on the water. The advantages of such qualifications will at once be seen, for by their means the most tortuous navigation may be overcome. Mr. George Mills of Glasgow is the patentee.

Educational.

IT ISN'T ALL IN BRINGING UP.

It isn't all in "bringing up,"
Let folks say what they will;
To silver scour a pewter cup—
It will be pewter still.
E'en he of old, wise Solomon,
Who said "train up a child,"
If I mistake not, had a son
Proved rattle-brained and wild.

A man of mark, who fain would pass
Far land of sea and land,
May have the training of a son,
And bring him up full grand:
May give him all the wealth of love,
Of college and of school,
Yet, after all, may make no more
Than just a decent fool.

Another, raised by Penury
Upon her bitter bread,
Whose road to knowledge is like that
The good to heaven must tread,
Has got a spark of Nature's light,
He'll fan it to a flame,
Till in its burning letters bright
The world may read his name.

If it were all in "bringing up,"
In counsel and restraint,
Some rascals had been honest men—
I'd been myself a saint.
O! 'tisn't all in "bringing up,"
Let folks say what they will;
Neglect may dim a silver cup—
It will be silver still.

[N. Y. Evening Post.

[For the Rural New-Yorker.]

THE INFLUENCE OF EDUCATION.

It is said, and said truly, that the people of this country enjoy the best educational advantages of any in the world. But our advantages are not greater than we need. When we reflect that the security of our government depends upon the general intelligence of the people, and see at the same time, the great number of emigrants that are continually arriving from the old world, who, flying from a despotism that crushes them down at home, bring with them the only education which such a government will give. One naturally will conclude that it is for our interest to scatter broadcast throughout the land the means of acquiring a liberal education.

We are different from other nations. It is not essential for the government of England that the masses of the English people should be well educated. It is not necessary for Napoleon to retain the crown of France, that every Frenchman should become acquainted with the theory of the government. If they did it is very probable that the result would be the other way, and that instead of retaining the crown, he might lose his head, and none will pretend to deny that if the people of Europe were as intelligent and well informed as the people of this country, they would not remain or a single year under their present masters—In fact the only safety of despotism, is in the ignorance of the people, and the only safety of Republicanism, is in the general intelligence of of the people. Whatever other foundations we may rest our institutions of government upon, the first, and foremost, should be in the universal education of the masses of the people. The means of attaining it must be placed within the reach of of every one so that none can well evade it. Let the next generation improve upon this! Let them understand the true theory of government! Let the duties of the citizen be taught in our schools! So that they may take a comprehensive view of things that may concern the welfare of our country.

Greece, and Rome, were once Republics, yet after a while they relapsed into monarchies. France has twice tried it and failed, and hitherto no nation has succeeded in establishing a Republican form of government that has stood the test of Time. And from that the friends of despotism presage the end of this. But the Republics of Greece and Rome were not planted upon the broad foundation of universal learning. It is true, that they handed down to us a literature, which has lasted longer than their nationality, and which has never been equalled. But they lacked that mighty engine of human improvement, the press, and knowledge could not be so universally diffused among the people as at the present day. It could be obtained only by a few; education was confined to a small circle, while the masses were entirely ignorant, and thus was a great chance opened for ambitious and designing men to seize upon the reins of government. In France, too, the revolution failed from the same cause, that is, the people were uneducated, and not being able to judge themselves, and guard the rights which their sword had obtained, they listened to the voice of party leaders, who wickedly deceived them, and gathered the power into their own hands.

With us it is different. The good sense of our ancestors planted early the institutions of learning, and as the forest disappeared before the hand of civilization, the school-house rose, and stood side by side with the humble log cabin. This early education instilled into the minds of the people enabled them to oppose a successful resistance to the encroachments of Great Britain. And when we emerged into a Republic, this early principle strengthened with our strength, and kept pace with the march of improvement. We owe our continuance as a Republic to the existence of our common schools.

Let education keep pace with the extension of our territory, and the increase of our population. It will keep the Church and the State separate. That alone would counteract the influence that the moral powers of the Church, might exert against the civil powers of the land—against the preservation of good order, and the execution of the laws. That alone, would render party strive less hot and bitter, and cast out corruption and bribery from political warfare. That alone, will elevate the sentiments of the nation, and teach us the true value of liberty, and the true value of the Union.

The destiny of the world depends upon the future course of America. The destiny of America depends upon the general intelligence of the people, and the general intelligence of the people depends upon our common schools.

Perioboo, N. Y., 1854. G. F. W.

DO YOU INTEND TO BE A GENTLEMAN?

A QUESTION FOR BOYS.

As I sat at the table a few evenings since, a gentleman called. He was invited to take a seat with us. As he had already supped, he declined. This person is a man of talent and education, but as I turned to look at him, in the course of conversation, I observed a habit which so disgusted me, that it was with an effort I could finish my tea.

I at once thought of the boys who read the Agriculturist, and thought I should like to write to them about the importance of forming correct habits in their boyhood. "The child is father of the man," Wordsworth says in one of his poems. The habits of character you form now, will, in all probability, be the habits and character you will retain when you are a man. I suppose the individual to whom I have alluded was entirely unconscious of doing any thing disagreeable. If not, perhaps he did not consider it of much consequence. He may have grown up with the opinion that little things are of small importance. Now, that this is not always so, you will easily see if you drop a spark of fire in a pile of shavings; the whole will be immediately in flames, and will do as much injury as if it had been kindled by a large coal.

Our happiness depends quite as much on little things as on great. Small trials are as difficult to bear as any. People often lose their patience when a dress is torn, or a pitcher broken, who would be quiet and calm if some serious misfortune had befallen them.

I hope, boys, you intend to be gentlemen. You have perhaps seen the remark made by Henry Ward Beecher, that "dress does not make the man, but after he is made, he looks better dressed up." Neither do gentlemanly manners and habits make the man, but they certainly improve him after he is made, and render him agreeable and prepossessing.

If you intend to be gentlemen, you must begin now, by always conducting, under all circumstances, just as well as you know how. Some of you, I suppose, have better advantages of society, and more careful instruction at home, than others; but no boy who has intelligence enough to be interested in an agricultural paper, need fail to be a gentleman if he tries.

A true gentleman is always courteous. He manners respectfully when spoken to, no matter by whom. Do you remember the anecdote of General Washington, who raised his hat, and bowed politely to a colored man he met, who had previously saluted him with the usual civilities of the race. A friend with him expressed surprise? "Do you think," said he, "I would be less polite than a negro?" I hope, when you are tempted to be uncivil to those whom you consider beneath you, you will not forget the good example of the Father of his country. I suppose the secret of Washington's politeness and greatness was, as his mother proudly said of him, that "George was always a good boy."

He was a gentleman, such a gentleman as I should be glad to believe every boy who reads this, will one day be. If you would be polite to all, you must cultivate kind feelings towards all. A gentleman is not a rough man. He may have great energy and power of character, as had Washington, but still he is a *gentleman.*—*Agriculturist.*

When Philip Henry, the father of the celebrated commentator, sought the hand of the only daughter and heiress of Mathews in marriage, an objection was made by her father, who admitted that he was a gentleman, a scholar, and an excellent preacher, but he was a stranger, and "*they did not even know where he came from.*" "True," said the daughter, who had well weighed the excellent qualities and graces of the stranger, "*but I know where he is going,* and I should like to go with him," and they walked life's pilgrimage together.

VARIATIONS OF TERRESTRIAL TIME.

The series of problems in many of our arithmetics in reference to the difference of time at different places on the earth's surface, is usually a sore puzzle to the tyro in mathematical science; and sometimes they are not clearly and definitely understood even by teachers themselves. A problem of this kind proves not unfrequently the *pons asinorum* so difficult to cross, and over which many an aspirant for advanced classes has to be carried on the shoulders of his companions. A terrestrial globe, with its dial-plate and brazen meridian, is the best instrument by which to render an intelligent explanation; and dull must be the scholar who, by its aid and a few lucid explanations from the teacher, cannot readily grasp the idea. But, with regret be it spoken, a majority of our country schools cannot boast the possession of a globe; and many a boy besides the writer, has solved these problems years before his eyes were blessed with the sight of any philosophical instrument or apparatus, except a blank-board and a piece of chalk.

The fact is of course well known to every reader of the Rural, that the time at different places varies with the differences of meridian, every degree of longitude making four minutes variation of time. Hence there will usually be seen in Railroad advertisements, especially those with long eastward or westward departures from a given point, a notice that the runs start by the time of a particular meridian. The New York Central, for instance, arranges its time tables by the Albany meridian; and woe to the Buffalo or Rochester man who regulates his arrival at the depot by the sun in his own sky; as in that case he will be a dozen or fifteen minutes behind time.

The above cut represents a clock with one central and twenty surrounding dials, each labeled with the name of some important place upon the earth's surface, the hands of each dial being adjusted to the time of those places, as compared with that of a given meridian; which, in this instance, is that of New York. The hands are all connected by a system of wheels, and may be driven by any power, as a weight or spring. In this instance the motive power is electro magnetism, which, within a few years has been adopted in many instances for scientific purposes, and is undoubtedly destined to work still more important changes in operations not yet "dreamed of in our philosophy." A glance at any two of the dials, when properly adjusted, will show at once the variation in time between any two places on the earth's surface named thereon.

CURIOSITIES OF CHINA.

Here is a man leading a white goat with only three legs, which he wishes to sell, but on a careful examination we perceive that one of the forelegs had been neatly amputated, while the animal was young. There are half a dozen gaming tables, each surrounded by its players and spectators. The Chinese are inveterate gamblers, and as the stakes at many of these tables are as low as a single cash, few are so poor that they cannot make a venture. One of these methods has some resemblance of the little jokers, so well known at our race courses. The player has three sticks, the ends of which are thrust through his fingers. There is a hole through each of the other ends, which are held in his hand, a cord was passed through one of them, and the play consists in guessing which one, as the cord may be transferred from one to the other by a quick movement of the fingers. I put a cash on the board, made a guess, and won a cake of suspicious looking candy, which I gave to the nearest boy, to the great merriment of the bystanders. There are also stands for the sale of peanuts, reminding us of the classic side-walks of Chatham street, and for the sake of Young America, we must invest a few cash in its favorite fruit. But here is an entertainment of an entire novel character. A man seated on the pavement, holds in his hand a white porcelain tile, about a foot square. This he overspreads with a deep blue color, from a sponge dipped in a thin paste of indigo, and asks us to name some design. I suggested the lotus. He extended his forefinger, crooked, flexible as an elephant's trunk, and as sharp as if the end had been whittled off; gives three or four quick dashes across the tile, and in ten seconds or less, lo! there is the flower, exquisitively drawn and shaded, its snowy cup hanging in the midst of its long swaying leaves. Three more strokes, and a white bird, with spread wings, hovers over it; two more, and a dog stands beside it. The rapidity and precision of that forefinger seems almost miraculous. He covers the tile with new layers of color, and flower after flower is dashed out of the blue ground.—*Bayard Taylor's Letters.*

As when sheep or other creatures are nourished by their pastures, the food they have eaten appears not in the same fashion upon them, not in grass, but in growth of flesh and fleece, thus the Word would truly appear to feed you, not by the bare discoursing of the Word over again, but by the temper of your spirit and actions, if in them you grow really more spiritual.

Sunday Reading.

[Written for Moore's Rural New-Yorker.]

A TRIBUTE OF AFFECTION,

TO THE MEMORY OF ALMIRA L. BENDER.

She was the light of home—the last,
Of that sweet sisterhood,
Whose little feet found early rest,
Within the "better land!"
With smile and song, she passed along—
With bounding step and free—
A fair young girl, around whose path,
Was falling silently,
The benison of loving lips, and many a whispered prayer,
That He who guards earth's precious ones, might nurture her in his care!

They knew not that the answer came
In that wild hour of woe,
Which swept like scathing tempest o'er,
And crushed life's blessings low!
Nor had they known those twining cords,
That wound each heart-string by,
Until the clinging vine was torn—
How suddenly away!
The hand which gave hath right again to ask the garnered trust—
Yet oh! the agony that wailed above that cherished dust!

Months have rolled on—the turf is green
O'er that pale sleeper's brow!
Yet many a gentle memory
Comes back unbidden now!
And when with pausing step we bend
Beside "her mound of flowers,"
With every leaf and bud is blent
Some dream of girlhood's hours!
"Her chestnut tree" is standing where moss-pinks and myrtle bloom—
His little thought who placed them there, to make *her grave* so soon!

We're sitting in the easy-chair,
Thy hands have cushioned o'er—
And thy needle swiftly plies its task,
As in the pleasant yore!
Affection's souvenirs scattered here,
The 'broidery at our side,
Each is a sweet remembrancer
Of thee, our household's pride!
Where'er we turn—where'er we look—some trace of thy fair skill,
Some dear memento of the Past, is treasured fondly still!

Thy books—we turn their pages now,
In deep and musing thought!
And the "token marks," with hallowed words,
Or sweet device enwrought!
The pencil-sketch is on the wall—
And there, our linger'ing gaze
Rests on thy childhood's portraiture—
O based of other days!
A gleam is on each sunny braid, a soft light in the eye—
And we almost deem those smiling lips will part in sweet reply!

Thy *music* hath a *sacred* place—
And its echo comes again,
At twilight's hush, with a gladsome gush,
Or plaintive, low refrain!
'Tis but a dream—within these halls
No inmate's awake!
For a seal of silence lieth,
On all, for thy dear sake!
No other hand may sweep the keys where those slight fingers strayed,
No other voice may breathe her words who slumbers with the dead!

We look that loved Herbarium o'er,
Arranged with school-girl care—
But where, alas! the hand that placed
Each fading wild flower there?
—For not of summer words alone,
Unto our hearts they tell—
Meet type of human hopes! we read
Their mournful lesson well!
She too, a fair slight flower set, drooped in Life's glad opening May—
And in her gentle purity, ALMIRA passed away!

West Bloomfield, N. Y., 1854. Marianna.

PAINFUL REGRETS.

Bulwer, a man of genius, and greatly admired by some, said in a letter to a gentleman in Boston, in 1843, "I have closed my career as a writer of fiction. I am gloomy and unhappy. I have exhausted the powers of life chasing pleasure where it is not to be found."

How much better if Bulwer had discovered his mistake at an earlier period! Had he employed his gifted mind in strengthening the cords of virtue, in repressing unholy passions instead of fanning them, how different would have been his review of life!

"I am gloomy and unhappy!" Richard Baxter said no such thing at the close of his useful life. He had written much, but he had not "chased pleasure where it is not to be found." John Bunyan made no such record at the close of his; nor did Owen, or Edwards, or Brainard, or Wesley, or Fuller, or Scott, or Payson. Men will reap as they sow, in spite of all their hopes and efforts to the contrary.—We have often thought of the Italian actor in Paris. He was gloomy and unhappy, like Bulwer. He consulted a physician. His physician advised him to mingle in scenes of gayety. "Especially," said he "go to the Italian theatre, and if Carlina does not dispel your gloom, your case must be desperate indeed." "Alas, sir," replied the patient, "I myself am Carlina; and while I make all Paris full of laughter and merriment, I am dying with melancholy and chagrin." What a commentary on those pleasures, in which so many indulge to keep up the spirits and drive away melancholy!

Resignation.—It pleases heaven to give us no more light in our way than will leave virtue in possession of its recompense. Grant me, gracious God, to go cheerfully on the road which Thou hast marked out; I wish it neither more wise nor more smooth; continue thy light of this dim taper Thou hast put into my hands; I will kneel upon the ground several times a day, to seek the best track I can with it; and having done that, I will trust myself and the issue of my journey to Thee, who art the fountain of joy, and will sing of comfort as I go along.

With love, the heart becomes a fair and fertile garden, glowing with sunshine and warm hues, and exhaling sweet odors; but without it it is a bleak desert covered with ashes.

Miscellaneous.

MY MOTHER.

BY ROBERT D. KNOWLES.

My heart oft turns to thee,
My dear beloved mother!
Thy image dwells in me,
And fears room for none other.
Like a fine mirror lakes,
That duplicate the heaven,
My soul a glory takes,
From thy example given.

When sorrow bathes in grief
My heart, that trusted strangers,
Thy memory gives relief,
And wards off all the dangers.
And when in seeming beauty,
Vice paints the guilt of sin,
I learn from thee my duty;
And then am strong again!

RECOGNITION.

Notwithstanding the continual, and, no doubt, in the main, honestly-meant judgments passing on the comparative worth or worthlessness of different individuals, it may safely be questioned whether human discernment ever assigned to mortal his rightful place in the scale of moral desert. The causes of this universal misapprehension are various, not the least of which is the studied concealment of self or of qualities actually possessed, and the affectation of foreign ones practised to a greater or less degree by nearly or quite every son and daughter of Adam, for the purpose of appearing something other and better, or, for a momentary whim, worse, than they really are. From this cause, it frequently appears that when called on to render a verdict in a case of character and disposition of our oldest, most familiar friends, with the best intention in the world to do exact justice, we find ourselves strangely puzzled and embarrassed by innumerable contradictions—unable to give more than a very general estimate at best, and often obliged to modify and make exceptions to that till the force of the original statement is well-nigh destroyed. Much of the difficulty we experience in character-analysis, must, no doubt, be attributed to our own lack of vision, and consequent inability to penetrate and make allowance for those worse than physical impediments of speech and action, by which even the most honest, straight-forward souls find themselves hindered in their attempts at revelation, and forced to set themselves right by blundering, painful explanations.

This want of human appreciation is one of the keenest miseries the sensitive soul suffers, and one for which philosophy has never found a satisfactory compensation. In vain it points to the compassionate eye and the pitying ear of Supreme Intelligence; consolingly whispers that there the longings, the struggles, the aspirations, unacknowledged by man, find indulgent audience and willing sympathy. The feeling of comparative isolation between us and the Divine presence, offers but a far-off repose. To our gross materiality, the seeming closer connection between ourselves and those bodily near us presents a ready refuge. Not for an abstraction can we forego the pleasure of troops of friends and the enjoyment of their good opinion. No, cost what it may, we must cling to the tangible, the palpable, though by this too earnest earthward seeking, we be comparatively estranged from communion with the only source whence we can expect true, entire recognition. This low approbativeness—this thirst for immediate (in the vulgar, unspiritual sense of near) apprehension may serve to partly explain the inferior lives led by scores of highly-gifted men and women, who, feeling cold and insulated in the sparsely-populated mountain region Nature assigned them for a habitation, in despair of raising to their height a sufficient number to form a congenial neighborhood, let themselves down to the level of common-place existence, and, for the sake of companionship, consent to accept the frivolous aims and unworthy ambition by which the rest of us are governed. An Esau-bargain this. No man can afford to conform downward; so doing, he brings himself into false relations where he hoped to establish a closer union. Visions of the better life to which he was born, haunt him reproachfully to the end of his days; but if he have somewhat better than we possess, let him impart it with generous confidence; if we accept it, he enriches himself as well as us; if not, let him wisely keep it for a better comfort than it can purchase in a market too poor to furnish its equivalent.

It is a great mistake in men commencing life on their own account, to deal much in explanation. The practice involves sad waste of time and resources, and nothing is gained by it. If you have acted honestly and from well-considered motives, and with a view to practical benefits, and not merely because it was your whim to do so and so, the truthful will as soon recognize your good intention in the simple act, that can speak for itself, as in a labored vindication, and you can afford to be misjudged by selfish, sneering skeptics; if you have not, an oily tongue and plausible words only add to the disgrace of the original falsehood. Indeed, this perverse world is growing somewhat incredulous as to the necessity or the fact of much special self-interpretation by single-minded men; by implication, those who indulge in it expose themselves to the danger of being set down as false and hypocritical; and, if conspicuous in their several callings, they do much towards bringing the whole craft to which they belong under censure. Witness the popular judgment of a class of public men, the genius of certain of whose leading members has been singularly industrious, if not happy, in this department. It sometimes happens in social life that we are half-earnest taxed with coldness and indifference by those toward whom we feel great good will and even warm affection, but because we are undemonstrative, fail to be fully understood by them. This complaint proceeds most frequently from the warm-hearted, who, I must believe, are oftenest troubled with jealousy; but they are no better satisfied, and perhaps finally lose all confidence, if, in obedience to their demand for increased profession of friendship, we attempt to establish a permanent good understanding on the basis of what they must soon detect to be forced show and reluctant (because, with many, love feels profaned by announcing itself in words) avowal. After these really valuable friends are lost beyond recovery, what would we not give to restore the old relations—solid esteem, partially concealed by constitutional reserve on our part, and equal substance, set off by greater show of friendship on theirs—and leave time to acquit us of their unjust charge. But no; if they have through error been unreasonable, exacting, we have been artificial, which is far worse, and deserve to lose them. Let us profit by the lesson. A.

[Written for Moore's Rural New-Yorker.]

NIGHT IN THE COUNTRY.

It is night! The weary traveler has found shelter for another night; the whistling plowboy, having carefully cared for his horses, has sought a bed of repose, and sleep has quietly closed his weary eyes; the shout of merry children is silenced as each early head is deposited on its pillow of down; and the careful farmer, after seeing that his house and barns are secure, has at length retired. All is now still and silent as the grave.

The "Queen of Night" is slowly, yet gracefully wending her way through her accustomed path, lighted by ten thousand glittering stars; though not so brilliant and dazzling as the "orb of day," yet so softly falls her light upon this darkened earth, it seems far more beautiful and sublime than the blazing splendor of the noonday sun. And each little star, as we sit silently gazing at it, seems to imprint upon our hearts (with the pen of imagination) beautiful thoughts. On such a night as this I would sit alone, to study and meditate upon the beauties of nature. Her works are innumerable and full of wisdom. She visits the most sacred places of the earth carrying in her hand the wand of beauty and loveliness; and I imagine she loves to linger in some secluded nook, and there combine all her energies in giving to the place a wild and romantic appearance. She speaks to us through the rushing winds, as they sweep mournfully through the neighboring forest, and her voice is heard in the murmuring rivulet, that winds its way through the dark recesses of yonder vale.

These are sounds which fall pleasantly upon the ear. There is heartfelt music wafted on each passing breeze, which none can hear but those that love the holy hours of midnight.—Night is the time for meditation. It is then our thoughts come to us, clear as the noonday sun, for true it is that "night unto night sheweth knowledge." M. J. S.

Spencerport, N. Y., Oct., 1854.

The Swearer Rebuked.—On a certain occasion, General Washington invited a number of his fellow officers to dine with him. While at the table, one of them uttered an oath.—The general dropped his knife and fork in a moment, and in his deep undertone and characteristic dignity and deliberation, said, "*I thought that we all supposed ourselves to be gentlemen.*" He then resumed his knife and fork, and went on as before. The remark struck like an electric shock, and, as was intended, did execution, as his remarks, in such cases, were very apt to do. No person swore at the table after that. And after dinner the officer referred to remarked to his companion, *that if the general had struck him over the head with his sword, he could have borne it; but the home thrust which he gave him was too much.* It was too much *for a gentleman.*—And it is hoped that it will be too much for any one, and every one who pretends to be a gentleman.—*Dr. Edwards.*

Unanimity.—"We must be unanimous," said Hancock, on the occasion of signing the Declaration of Independence; "there must be no pulling different ways." "Yes," answered Franklin, "we must all hang together, or most assuredly we shall all *hang separately.*"

EARLY DECAY OF AMERICAN WOMEN.

Mrs. H. B. Stowe, in her recent book of travels in Europe, makes the following sensible remarks about the comparative beauty of the women of England and America:

A lady asked me the other evening, what I thought of the beauty of the ladies of the English aristocracy; she was a Scotch lady, by the by, so that the question was certainly a fair one. I replied that certainly report had not exaggerated their charms. Then came a home question—how the ladies of England compared with those of America? "Now for it, patriotism," said I to myself, and invoking to my aid certain fair saints of my own country, whose faces I distinctly remembered, I assured her that I had never seen more beautiful women than I had in America. Grieved was I to add, "but your ladies keep their beauty much later and longer." This fact stares one in the face of every company; one meets ladies just fifty, glowing, radiant, and blooming, with a freshness of complexion and fullness of outline refreshing to contemplate. What can be the reason? Tell us, Muses and Graces, what can it be? Is it the conservative power of sea-fog and coal smoke, the same which keep the turf green, and make the ivy and holly flourish? How comes it that our married ladies dwindle, fade and grow thin, that their noses incline to sharpness, and their elbows to angularity, just at the time of life when their island sisters round out into a comfortable and becoming amplitude and fullness? If it is the coal and sea-fog, why, then, I am afraid we shall never come up with them?

But perhaps there may be other causes why a country which starts some of the most beautiful girls in the world, produces so few beautiful women. Have not our close stove-heated rooms something to do with it? Above all, has not our climate, with its alternate extremes of heat and cold, a tendency to induce habits of indolence. Climate, certainly, has a great deal to do with it; ours is evidently more trying and more exhausting, and because it is so, we should not pile upon its back errors of dress and diet which are avoided by our neighbors. They keep their beauty because they keep their health. It has been as remarkable to me as anything, since I have been here, that I do not constantly, as at home, hear one and another spoken of as in miserable health, very delicate, &c. Health seems to be the rule and not the exception. For my part, I must say, the most favorable omen I know of for female beauty in America, is the multiplication of water-cure establishments, where our ladies, if they get nothing else, do gain some ideas as to the necessity of fresh air, regular exercise, simple diet, and the laws of hygiene in general.

HINTS TO POETS.

We are overwhelmed with poetry. Either the month has not touched the Castalian fount, or the autumnal rains have swollen it. Much of the poetry that comes into our hands is written upon such delicate paper, and with such elegant penmanship, and is accompanied with such modest notes from virgin authors, that we are at our wits' end to know what to do with it. How can we decline publishing what has been prepared with so much pains, and is proffered with such delicate consideration? In order to recover our judgment sufficiently to decide upon the merits of elegant rhyme-paper before us, we beg that the Muses will be more sparing of their favors for at least two months to come. And for the guidance of those who meditate such favors for us in the future, we beg leave to submit the following hints:

1. Do not take a rhyming dictionary and select a row of words, and then *prefix* syllables to make out the requisite number of feet.—Poetry constructed upon that principle usually requires to be read backwards.

2. Do not take a foot rule and measure off inflated prose into blank verse. This is apt to confuse the reader as to the proper use of capitals and the pauses of the sentence.

3. Never send us anything "upon the recommendation of judicious friends, who desire to see it in print."

4. After composing, lay aside your piece until the intoxication of the first inspiration has subsided. Keep it a month and then read it over.

5. Do not be mortified if your piece is not published; but take it for granted that you would be more mortified if it was.—*Independent.*

BY AND BY.

There is music enough in these three words for the burden of a song. There is a hope wrapped up in them, and an articulate beat of a human heart.

By and by: We heard it as long ago as we can remember, when we made brief but perilous journeys from chair to table, and from table to chair again. We heard it the other day, when two parted that had been "loving in their lives," one to California, the other to her lonely home.

Everybody says it—some once or other.—The boy whispers it to himself, when he dreams of exchanging the stubbed little shoes for boots like a man. The man murmurs it—when in life's middle watch he sees his plans half finished, and his hopes, yet in bud, waving in a cold, late spring. The old says it when he thinks of putting off the mortal for the immortal, to-day for to-morrow. The weary watcher for the morning, whiles away the dark hours with "by and by—by and by."

Sometimes it sounds like a song; sometimes there is a sigh or a sob in it. What wouldn't the world give to find it in the almanac—set down some where, no matter if in the dead of December—to know it would surely come—But, fairy-like as it is flitting like a star-beam over the dewy shadows of the years, nobody can spare it—and when we look back upon the many times those words have beguiled us, the memory of that silver by and by, is like the sunrise of Ossian, "pleasant but mournful to the soul."—*Tribune.*

THE LAUREL WREATH.

BY MRS. JAMES A. STONE.

A starry knell at the shrine of Fame,
A maiden young and fair,
With a blushing cheek, and a starry eye,
And a wealth of raven hair.
"Give me some laurel leaves," she prayed,
"To twine in the wreath I wear."

Then a voice came forth from the temple old,
A voice both deep and dread;
Speaking in hollow and mocking tones
Like the voices of the dead.
"The laurel leaves are thine, sweet maid,
To garland thy fair young head."

The maiden laughed in her girlish glee,
As she loosened her fairy crown,
And under the shade of the temple dim,
All joyously sat her down.
Striving to fasten the laurel leaves
On the rose-alem's shining brows.

But a cloud came over her sunny brow,
As she wearily toiled in vain,
And her tear-drops glittered amid the flowers
Like the sparkling summer rain.
"I cannot fasten these leaves," she sobbed,
"In my roses' blushing chain."

Then again the sound of that mighty voice
Came forth from the deepening shade,
Bearing a message of fearful truth,
To the heart of the trembling maid,
"'Tis folly to gather these laurel leaves
With the flowerets of peace to braid.

Seek ye the thorns in the roses' home
When the tree-tops gently bow,
With them ye may fasten the laurel leaves,
In a garland round your brow,
Then trample beneath you in the dust
The flowerets that blind it now."

Trembling and pale, the maiden gazed
On the rose-wreath in her hand;
Then wound it amid her shining curls
And fastened its dew-gemmed band,
And the dung the laurel leaves away,
As she fled from that fearful land.

"OUR CHARLIE IS GONE!"

But a few months since, a dear sister's home was gladdened by the birth of a child—a bright-eyed, active, and beautiful boy, who with added cares, brought many an added joy to his mother's heart. His father, too, rejoiced that a son was given unto him, and the thought of the claims which this new-born immortal had upon him, gave new energy to his determination to fulfil manfully the work of life, so as to bear and leave a name which any son should remember lovingly as well as proudly.

But a few weeks ago we were all gathered at the "old homestead," once more. Little Charlie was there, his first and last visit to his grand-parents, and the dear place where his mother had spent all the sunny years of girlhood. They were there, however, preparatory to their departure for a distant State, to find for themselves a new home among strangers. In a few days they were gone, but that infant as well as its mother, left tearful hearts behind. It is hard parting, even for a few years, with friends we love, or with a child who has won our heart by his innocent love for us.

But a few days ago, and we heard from them,—all were well, the journey had been a pleasant one, they had met with kindness everywhere, and would soon be settled in a thriving town not far from the mighty Mississippi. The father had gone in advance, to complete some preparations for their reception. Little Charlie was well, and all their anticipations were of happiness. All this, but *a few days ago.*

But a few hours ago, a sad message came; it said,—"Our Charlie is gone!" O, how must the lonely mother have felt when, after all was over, she met her husband—who could not come in time to see his darling laid to sleep under the fresh turf—and must say to him, "Our Charlie is gone! Gone from our embrace, summoned home to the Kingdom where! Gone, where little Carlton went before!" A mother's heart alone can tell the anguish of that hour. A father alone can imagine the bitterness of that moment's sudden pang. But a Christian life prepares—if anything can prepare—the soul for the saddest bereavement; and it is good to say with the whole heart, "Thy will be done." This truth is taught by a severe, yet gentle and loving Father.

But a little while, at the longest, and the parted shall meet again. But a little while O, sorrowing mother, and you need mourn no more. O, in the presence of Death, how Time and its interests dwindle into insignificance, and Eternity surrounds and enthralls the soul. Here we are now, but we know not how soon the summons shall come to call us where "Our Charlie is gone."—R.

Love and Friendship.—Love seizes on us suddenly, without giving warning, and our disposition or our weakness favors the surprise; one look, one glance from the fair fixes and determines us. Friendship, on the contrary, is a long time in forming; it is of slow growth, through many trials and months of familiarity.

If you are disquieted at anything, you should consider with yourself, is the thing of that worth, that for it I should so disturb myself, and lose my peace and tranquillity?

WELL DONE, GIRL!

One Sunday evening, not many nights ago, the Rev. Mr. Thompson performed a marriage ceremony at the Tabernacle—both parties said Yes at the proper time, and the reverend gentleman said Amen.

"I want you to perform the same thing for me," said a well-dressed, youngish man to Mr. Thompson.

"When?"

"Now—right off to-night."

"Can't you put it off a little? It will make it rather late."

"No—the lady says now or never, and I am very anxious. Will you go?"

"Yes; where is it?"

"Close by—only a few steps west of the Park. We are all ready, and will only detain you a few minutes on your way home."

Mr. T. went to the place, which was a respectable boarding house, and everything crimped decorum. The lady, young and pretty, neatly dressed, and altogether a desirable partner for the gentleman—was presented, and a short prayer, as usual upon such occasions, offered, and then hands joined.

"You, with a full sense of the obligations you assume, do promise, here in the presence of God and these witnesses, that you will take this woman, whose right hand you clasp in yours, to be your lawful, wedded wife, and as such you will love and cherish her forever."

"I do."

"And you, Miss, on your part, will you take this man to be your lawful, wedded husband?"

"NO!"

We have heard in times past, when showers were fashionable, some pretty heavy claps of thunder; but none that ever rattled about the tympanum of the bridegroom was quite so loud as that stunning little monosyllable.

"No, I never will!" said she most emphatically, and inclined array to her seat, leaving her almost-husband looking and probably feeling just the least trifle in the world foolish.

Mr. Thompson remonstrated—not to induce her to change that No for Yes, but for trifling with him in the solemn duty of his calling, and asked for an explanation.

"I meant no disrespect to you, sir, nor to trifle with your duty, or the ceremony you were called upon to perform; but I had no other way to vindicate my character. I came to the city a poor sewing girl. I worked for this man. He made proposals of marriage to me, but from other circumstances I doubted his sincerity, and left his employment and went back to the country for a while. When I returned I found the door of my former boarding-house closed against me, and this lady, whom I had esteemed as a kind friend, cold and quite indisposed to renew my acquaintance, and I insisted upon knowing the reason. I learned that this man had blackened my character, denied his proposals of marriage, and said I was—no matter what. I said to the lady, 'let me come back, and I will prove my innocence. Will you believe what I say if he will marry me?'

"'Yes; I certainly will, and so will all who know you.'

I renewed the acquaintance, he renewed his proposals—I accepted, and said 'Yes, the minister at once.' He slandered me—I deceived him. I proved my words true, and his false. It was the only way a poor, helpless girl had to avenge herself upon a man who had proved himself unworthy to be her husband. It was only, at the right time, to say one word—one little word. I have said it. I hope it will be a lesson to men, an example to other girls, and that in many other and different circumstances they will learn to say 'No.'"

"If I was angry, for a single moment," said Mr. Thompson, "I carried none of it over the threshold. It was a severe lesson, but well applied. I went home pondering on the value of the word—No."—*N. Y. Tribune.*

HOME INFLUENCE.

Wouldst thou listen to its gentle teaching,
All thy restless yearnings it would still;
Leaf, and flower, and laden bee are preaching,
Thine own sphere, though humble, first to fill.

Truly has it been said, that "our duties are like the circles of a whirlpool, and the innermost includes home." A modern writer has designated home "heaven's fallen sister;" and a melancholy truth lies shrouded in those few words. Our home influence is not a passing, but an abiding one; and all-powerful for good or evil, for peace or strife, for happiness or misery. Each separate Christian home has been linked to a central sun, around which revolves a happy and united band of warm, loving hearts, acting, thinking, rejoicing, and sorrowing together. Which member of the family group can say, I have no influence? What sorrow, or what happiness, lies in the power of each!

"A lighted lamp," writes M'Cheyne, "is a very small thing, and it burns calmly and without noise, yet it giveth light to all who are within the house." And so there is a quiet influence, which, like the flame of a scented lamp, fills many a home with light and fragrance. Such an influence has been beautifully compared to "a carpet, soft and deep, which, while it diffuses a look of ample comfort, deadens many a creaking sound. It is the curtain which, from many a beloved form, wards off at once the summer's glow and the winter's wind. It is the pillow on which sickness lays its head, and forgets half its misery." This influence falls as the refreshing dew, the invigorating sunbeam, the fertilizing shower, shining on all with the mild lustre of moonlight, and harmonizing in one soft tint many of the discordant hues of a family picture.

A Nutshell of Truth.—Here is a brief paragraph into which a big heap of truth is squeezed:—"Did you ever scratch the end of a piece of timber slightly elevated, with a pin? Though scarcely heard at one end, it was distinctly heard at the other. Just so it is with any merit, excellence, or good work. It will be sooner heard of, and applauded, and rewarded on the other side of the globe, than by your immediate acquaintances."

MOORE'S RURAL NEW-YORKER

ROCHESTER, OCTOBER 14, 1854.

The War News.

The Canada brings important news from the seat of war. The Baltic fleet is to return for the winter without any further warlike demonstrations, and neither Sweaburg nor Cronstadt are to be attacked this season. This respite of at least eight months will not be left unimproved by the Czar, and the probabilities are that those important fortifications, which are the keys of St. Petersburg, will be so strengthened by next summer as to render them impregnable against any force which the allies can bring against them.

Even the *London Times* acknowledges the Baltic campaign to be a failure, and sings "Britannia Rules the Waves" out of the wrong corner of the mouth. The auto-eulogies on the exploits of Sir Charles Napier have ended in smoke, and the Bear has fairly kept at bay both the Cock and the Lion. It is true a few defenceless villages have been captured and a few hundred merchantmen taken as prizes; but they could no more be expected either to resist or escape a war steamer, than a flock of helpless chickens could escape the swoop of a hawk.—Bomarsund has been besieged and taken, and its walls dismantled; but that was a mere outpost calculated to delay rather than defeat a formidable invasion.

In the Black Sea, however, important movements are in progress, and an inevitable crisis near at hand. The Allies, with an army of 90,000 men and 600 vessels, including steamers, men-of-war and transports, have made a descent on the Crimea, with the evident intent of attacking Sevastopol. This is the great Russian naval Station on the Black Sea, and is strongly fortified and garrisoned. The entire fleet of the Czar in those waters is also anchored under its walls, and the fortress presents a front both to sea and land bristling with bayonets and grinning with artillery. The struggle for the victory in this quarter will be a desperate one, for the prestige of success on either hand must tell upon all future operations of the war. If the Allies are baffled here as they certainly are at the North, victory will hover for a long time over the banners of the Czar, if he does not eventually force his opponents into an ignominious peace. The probabilities are, however, that the expedition will prove successful; for the invaders half understand the consequences both of success and of failure, and they possess warlike resources such as the world has never before seen. Even the "Invincible Armada," despatched under Philip II. of Spain, for the conquest of England, and so famous in warlike annals, numbered only 137 ships of war, 20,000 soldiers and 11,000 sailors, while this, as above stated, number six hundred vessels and ninety thousand men; more than seventy thousand of whom are English and French. The war ships of the Spanish Armada could no more compare with a modern built war steamer, or line-of-battle ship, than a Chinese junk can compare with a Seventy Four. Besides the enormous siege guns, the destructive Paixhans and bomb mortars, the Congreve Rockets, and other inventions of modern warfare, were unknown in those days.

Another Missing Steamer.—The Collins steamer Arctic sailed from Liverpool on the 20th ult., since which time she has not been heard from. She should have reached her docks by the 3d at least, as the Collins line rarely exceed in a trip fourteen days, and have made the run many times in less than ten.—Considerable anxiety is felt on her account, but the staunch manner in which she is built, and the unprecedented success of the voyages of the Collins line, are earnests of her safety. She may have been disabled and put back, as did the Atlantic a few years since, which broke a shaft after reaching the Banks of Newfoundland, and in consequence of head winds was obliged to re-cross the ocean under canvass.—Every one remembers the intense anxiety manifested on her account, and the jubilee that followed when the news of her safety first reached our shores. So may it prove with the Arctic.

Dead Heads Cut Off.—The Indiana railroads have followed in the wake of those of Ohio, dispensing with runners and outside agents, and cutting off dead heads. So effectually has this guillotioeing process been carried on, that the enormous abuse is cut up in the State root and branch; and not even railroad officers are to be passed free. It is time that this was done; for a gentleman passing over the Hamilton & Dayton (Ohio) road states that out of sixty persons who came under his observation, *thirty* were non-paying passengers. Such a system of favoritism is a fraud upon the stockholders and the community. If it cost one hundred dollars to run a train, and half are non-paying passengers, the other half must of course pay double in order to sustain the road. Let the example be followed throughout the country, until *dead head* is an obsolete idea.

The New Bishop of Iowa.—The Rev. Dr. Lee, of this city, recently elected Bishop of Iowa, has accepted the appointment and will be consecrated to the duties of his sacred office on the 19th inst., at St. Paul's Church, Rochester.

Liability of Common Carriers.

The New York papers say "Judge Phillips, of the New York Courts, has decided that it is not enough for the driver of an Express wagon, or other common carriers, to throw baggage carelessly on the deck, or leave it on the wharf at the gang plank of a steamboat, but he must exercise prudence and care in its delivery to the persons authorized to receive it. A delivery of goods to the wrong person does not exonerate the carrier. The same Judge has also decided that a Railroad is not responsible for goods; the delivery of which is beyond their terminus."

All points except the last, are undoubtedly correct; but if the learned Judge has decided that as stated, he is certainly wrong, and goes against the whole current of legal decisions. It is well settled that when a common carrier receives goods to be delivered at a certain place, he is bound to deliver them safely, whether a part of the route is under the control of another company or not; and nothing will excuse him except "acts of God and the public enemy."—If goods are lost after passing into the hands of a second carrier, he has a remedy over against the latter, for any damages he may have been compelled to pay the owner of the lost goods.

Foot on the other Foot.—That bigoted and intolerable Journal, "*Shepherd of the Valley*," recently published at St. Louis, which declared a general diffusion of education among the people to be a curse, and rejoiced in the idea that when the Roman Catholics were in the ascendency, which they would be at some future day, religious toleration in this country will be at an end, became defunct as we announced some time since. Not even the official sanction of the Bishop of St. Louis could keep vitality in its miserable carcass.

The St. Louis papers now announce that the press, type, and all the property of the office have been purchased by the "Know-Nothings," who now publish a paper entitled "*The True Shepherd of the Valley*," which is hostile to the Roman Catholic faith, advocates a repeal of the Naturalization laws, and opposes the election of all foreigners to office.

The Northrop Kidnappers.—The trial of Merrill and Russel, the kidnappers of Solomon Northup, came on at Saratoga on the 3d, but was put over on affidavits of the accused, until the February term. They say they want the testimony of the book-keeper of the slave pen in Washington, where Solomon first found himself in slavery, and a commission has been issued to obtain his testimony. It is stated that strenuous efforts have been made on their behalf to get the negro out of the way, or induce him to a compromise, which, if true, ought to be looked into at once, and those attempting it indicted for compounding a felony.

Another Richmond in the Field.—The Know Nothings held a Convention last week in New York city, and put in nomination an Independent State Ticket, with Daniel Ullman at its head for Governor. The history of politics in this State shows an parallel with the present division of parties, and we are not sorry to see the despotic chains of party discipline thoroughly broken. Triangular political contests are not unfrequent; but a polygonal one with a dozen sides is not quite so common. Who wants to be the next President?

Burning of a Lake Steamer.—The steamer E. K. Collins, which left Detroit on Sunday evening, bound to Cleveland from the Sault St. Mary's, was burnt about midnight of that day. A large number of passengers were on board, three of whom are known to have perished, and a large number of others are missing. The greatest consternation existed among the passengers, which tended to increase the peril and lessen the chances of escape. The origin of the fire is unknown.

Explosion.—The steam boiler in the Montour Rolling Mills, at Danville, Pa., exploded on the 6th inst., killing at least three persons, and wounding many others, some of whom will probably die. The boiler was moved a distance of one hundred feet from its position, and the explosion demolished a frame dwelling and a stable, and tore away forty feet of the mill. It is said that a deficiency of water in the boiler was the cause of the catastrophe.

Trial of Dr. Graham.—Dr. Graham, of New Orleans, who last August killed Col. Lomino in an affray at St. Nicholas Hotel, in New York, is now on trial in that city for murder. The jury panel, containing forty names, was exhausted, and but eleven jurors obtained; the twelfth being afterwards selected by a summons of talesmen. A good deal of interest is excited by the cause, as the parties were quite distinguished.

Railroad Accident.—On the morning of the 6th, the Emigrant train on the New York Central railroad ran over a horse near Newark, throwing the engine, tender and one car off the track. The fireman jumped off the tender to save himself, when it fell upon him, crushing him to death. No other person was injured.

A Curious Case.—Among the fresh arrivals at the Penitentiary, was a non-descript, in female attire, but with a beard! The phenomenon turned out to be what the beard indicated. And yet the man had gone through the ordeal of a trial at the Schoharie Circuit, and had been sentenced as a woman! It appears that in the same guise, the man had been employed as a cook in a public house, for some time prior to being sentenced!—*Argus.*

Look Out for the Engine!

The Providence and Worcester railroad, near the former city, runs through the premises of an old man named Lyman Hayes, who felt himself aggrieved at the award of the Commissioners appointed to assess damages for crossing his land; and consequently he refused to submit to their decision. On the 3d inst. he placed a small tenement upon the track, ensconced himself within, taking along several kegs alleged to contain powder, nailed up the door, and swore he would blow himself and all who interfered with him into the air. Two trains coming along were detained two hours, and until the police of North Providence were sent for, who, in the presence of more than a thousand people, pulled down the old man's shanty, and hurried him off to jail. About half a keg of powder was found, but the old man reserved the explosion to a future occasion, probably when both himself and the crowd would be at a distance sufficient to escape the consequences.

The National Baby Show.

Cincinnati, Oct. 5, 1854.

The National Baby Show took place at Springfield, (Ohio,) to-day, and one hundred and twenty entries of babies were made.

The first premium of the finest baby of two years old or under, was a tea set with a salver, valued at three hundred dollars.

The second premium for the next best baby, was a tea set valued at two hundred dollars.

The third premium was two hundred dollars for the finest child under one year of age.

The fourth premium was a Parian marble group.

The first premium was awarded to Mrs. Romer, of Vienna, Ohio; the second to Mrs. McDowell, of Cincinnati; the third to Mrs. Arthur, of Philadelphia; the fourth to Mrs. Henry Howe, of Cincinnati.

A letter was received from "Fanny Fern," and read to the edification of all concerned.

Letters were also received from Mrs. Swisshelm, Mrs. Crittenden, Mrs. Mott, and Horace Greeley, Esq.

Mr. Greeley thought that much attention should be given to the development of the human constitution in a country where able-bodied men sold for $500 to $1,500 a-piece.

Mrs. Mott thought that black babies should have been admitted to this exhibition and had an equal chance with the whites.

Among the exhibitors was an old woman who came with her seventeenth child. She claimed a premium on that ground.

The Number of Slaveholders.—The Census Bureau will, in a few weeks, issue a supplementary work, embracing, among other things, a statement of the number of slaveholders in the United States. We learn from the Superintendent, Mr. De Bow, that, as nearly as can be ascertained for the present, that number will be about 375,000. It is to be hoped that the several grades of slaveholders will be given; as, for instance, how many own one hundred slaves or more, how many fifty, &c. We incline to the opinion that one-tenth of the slaveholders own one-half of the slaves; and if the census returns are full and satisfactory, we feel confident that this fact will appear. We are also impressed with the idea that another tenth of the slaveholders would be found to own half of the remaining half of the slaves; and if we are correct in this opinion, formed from long acquaintance with slavery, it would appear that one-fifth, or seventy-five thousand of the slaveholders, own three-fourths of the slaves.—*National Era.*

Affairs in Utah.—The Washington correspondent of the Courier and Enquirer, writes as follows:—"The official term of Governor Brigham Young, of Utah Territory, expired on Friday, the 29th of September. His successor has not been agreed upon, and I learn that the appointment of one has been found a matter of considerable difficulty. Young will not be re-appointed, but it is well known that no man, not a Mormon, could govern that lawless and impious community, without the material aid of one or two well appointed regiments. The Secretary of the Territory, A. W. Babbit, formerly delegate in Congress, will direct affairs until the further action of the President. The political insubordination of these people is as remarkable as their moral and religious irregularities. Mr. Young and his associates have not thought fit to forward copies of their Territorial laws, or the accounts of the public appropriations, for the past two years.

Civil vs. Military Law.—A. H. Hawks, of Belchertown Mass., has been fined $10 and costs before a Justice in Amherst, for stabbing Edward Mather in the foot, with the bayonet of a gun, at the late muster at Amherst. Hawks was a sentinel, and claims to have "done the deed" in the execution of his duty in maintaining the sacredness of the muster ground from outside invasion; but it was contended, on the other side, and to the satisfaction of the Justice, that it did not appear that Mather was thrusting himself over the line, and that if he was, the kind and degree of force used to restrain and punish him were not justifiable. The case is to be carried up to the Common Pleas Court, and its final result is a point of considerable interest.

Curious Surgical Operation.—A child two and a half years old, whom beneficent Nature, in one of her strange freaks, had endowed with two hands upon one arm, was lately relieved of one of these appendages by the skilful aid of Dr. J. H. Jennings, and from the superfluous hand enough flesh was dissected to manufacture a neat thumb for the hand which was allowed to remain, and which lacked that necessary limb. The operation was performed while the patient was under the influence of chloroform, and the hand thus made to order is doing well.—*New Bedford Standard.*

A Splendid Present.—The Emperor of Russia has presented to Chas. H. Haswell, Esq., the well-known engineer of this city, a magnificent diamond ring, worth some $1,500, in consideration of his professional labors in the furnishing of drawings of steam machinery, including the engines of the steamer Powhatan, which Mr. Haswell had designed for the United States Navy. The drawings were made at the instance of the late Mr. Bodisco, former Minister to the United States.—*Trib.*

News Paragraphs.

☞ The Mormons continue to make great progress in Europe. All over England they are making converts, and the London Times thinks their religious services ought not to be protected by the laws. The British army in Turkey contains several branches of the Church. At Hamburg the authorities have prohibited their meetings. The Mormon emigration of next year to the U. S. will be large.

☞ Capt. Inglefield sends despatches to the Admiralty from the Arctic regions, reporting the discovery of extensive mines of good anthracite coal on the coast of Greenland in about latitude 71 deg. This coal will prove valuable should screw ships be sent there for whaling, as is very likely to be done. He says nothing of either of the English Arctic expeditions, or of that under Dr. Kane.

☞ Eighteen thousand people in the city of New York live under ground—that is to say, in cellars, vaults and *holes*. (So says Rev. Mr. Cuyler, and his information is derived from actual investigation.) He tells of one neglected quarter—a single lodging room, or den—in which one hundred outcasts herd together, indiscriminately, every night.

☞ The stockholders of the New Haven Railroad Company met at New York last week Tuesday, to consider the question as to whether the Company should assume the spurious stock. A debate took place on a resolution to appoint a committee to investigate the proceedings of officers and managers, which was very acrimonious and disorderly.

☞ A United States Marshal having arrived in New Bedford one day last week, information was given to the public, by a crier at all the street corners, who warned the colored men and friends of freedom to be on their guard.—The Standard says, whether there was any real cause for alarm in this instance it is not advised.

☞ The Milwaukee Sentinel of Sept. 26th, says that over sixty cars loaded with produce arrived there on Saturday afternoon and night, by the Milwaukee and Mississippi railroad, bringing 18,000 bushels of grain, 1,000 bushels of potatoes, 300 barrels of flour, 760 barrels mill feed, besides lots of other items.

☞ Herman Blennerhassett, the second son of Herman Blennerhassett, of the island in the Ohio river which bears that name, died in New York, on the 17th ult., after a protracted illness. He was an artist of considerable eminence.—The only surviving member of the family, Jaspar L. Blennerhassett, now lives in Troy, Missouri.

☞ Enlistments for the army are going on much more briskly since the passage of the bill raising the pay of rank and file. From the 1st to the 20th of September, last year, the number of enlistments at Buffalo in the army was 96, while for the same period of the present year the number has been 331.

☞ The Washington Globe says:—By looking at the index of the Congressional Globe, which we now have in press, it appears that one hundred and twelve one hour speeches were made at the last session of Congress, in the House of Representatives, on the Nebraska-Kansas bill.

☞ A sailor on the New Bedford whaleship Logan, lost a sheath-knife overboard on the morning of the 23d of August, and in the afternoon of the same day two dolphins were caught from the same ship, and upon opening one of them, the same knife, known by the name upon it, was taken out.

☞ A great excitement is caused among the church people of England, by the secession from the church of the gifted and distinguished Arch Deacon Wilberforce, on the ground that his conscience would no longer allow him to admit the supremacy of the Queen as the head of the Church.

☞ The Russians are importing cotton from Khiva, which can furnish it in considerable quantities. The Cossacks of Orenburg, with their ox wagons, transport it from Khiva to steamboat navigation on the Volga at the rate of 50 cents per 100 lbs.

☞ The sudden death of young Mr. Draper, son of the ex-Counsel at Paris, is announced by M. Gaillardet in his French Courier correspondence. Near Dieppe he was climbing up a precipice and fell, and a young fisherman seeing him, was so alarmed that he, too, fell.

☞ There are fifty-three flouring mills in Oregon Territory, constructed with all the modern improvements. The wheat produced there is of excellent quality, and the Oregon Statesman says that flour manufactured from it is second to none.

☞ The vote of Charlestown, in the proposition for annexation to Boston, was taken on Monday week, and resulted as follows: Yeas, 1,412; nays 1,117. The defeated party tolled the bells, while the victorious paraded the streets with bands of music.

☞ Of the eight or nine members composing the editorial corps of Savannah at the commencement of summer, only one remains at his post. One has died, and the rest have been compelled by the unhealthiness of the city to leave it.

☞ The Air Line Railroad, surveyed between Providence and Fishkill, is completed to Hartford. By this route, two hours and a half will be saved between New York and Providence.

☞ The new Beer Bill in England forbids tavern-keepers to sell except to "Travelers," but neglects to define what a traveler is. It is urged that a man who travels from his own house to the tavern will come under the title.

☞ The people of Odessa are in great alarm. The General in command had issued an order that in case of necessity the inhabitants were to retire to Tiraspol, "first reducing Odessa to a heap of ruins and ashes."

☞ On Thursday night week, six men broke into the Catholic nunnery at Louisville, knocked down one of the Sisters of Charity with a brick, and then, becoming alarmed, made their escape. The object, it is supposed, was robbery.

☞ At Butler county, Ohio, a few days since, a man wagered that he would drink a larger quantity of whisky than another, who accepted it. The former drank one gallon and a half pint, and then died.

☞ A colored man calling himself Rev. P. Underwood, lectured at Bowmanville, C. W., and asked for money to redeem his two sisters from slavery. When asked to show his credentials, he had none, and left.

☞ The Enquirer notices a fight at a wedding in Cincinnati the other night, when Mr. Jas. *Red* married Miss Eliza *White*, and the guests were all *blue*, hence the tri-colored fight.

News Brevities.

—Gen. Cass is stumping the State of Mich.

—A woman has been elected constable in Perry county, Iowa.

—Calumet has been designated as the place for holding the next Provincial Fair.

—The debt of Philadelphia is fast verging on twenty millions of dollars.

—Miss Mary E. W. Betts, a popular western poetess, died at Cincinnati on the 24th ult.

—The State Journal of California chronicles a melon in Sacramento weighing 52½ lbs.

—No less than 2,650 persons died of cholera in London, during the week ending Sept. 16.

—It is rumored about that the Emperor of the French is to visit England shortly before Christmas.

—The Hamilton Journal advocates a Maine Law, and thinks a majority of the Canadian people are in favor of it.

—Ex-President Tyler and his wife are now on a visit to Mrs. Tyler's friends, on Shelter Island, opposite Greenport, L. I.

—Some of the Boston papers, not content with the recent annexation of Charlestown, are clamorous to acquire Roxbury.

—The late riots in New Orleans were extinguished by copious showers of rain, which fell for three consecutive nights.

—The four Coroners of New York city held 841 inquests during the quarter ending Sept. 30th, for which they receive $5,460.50.

—Receipts of wheat at Buffalo from Saturday to Monday, were 60,000 bushels, corn over 200,000 bushels, and oats also large.

—A couple were married the other day on the top of Mount Holyoke, Mass. Certainly an appropriate place to put on the holy yoke.

—The people of Poughkeepsie are organizing a Water Works Company. On opening of the books $18,000 were promptly subscribed.

—The Society for the Improvement of Domestic Poultry hold their next annual Show at Utica, on the 28th, 29th and 30th of Nov.

—Mr. Powell has introduced into the Canadian Parliament a bill to do away with the property qualification of members of Parliament.

—One hundred and three new students have entered Union College, Schenectady, since the opening of the present term, on the 8th ult.

—The Courier & Enquirer says that since the 1st of January last, eighty new blast furnaces have been put in operation in Pennsylvania.

—The Spiritualists in Massachusetts, have made arrangements for holding another Convention. They hold their sittings in Springfield.

—The Germans in New York city are estimated at 80,000 at least. They congregate chiefly along the eastern borders of the city.

—The Warsaw Mirror says it is admitted that the County Fair held in that village on Wednesday week, was the best ever seen in that section.

—There is a most astonishing yield of acorns in Illinois this season, and also in the valley of Virginia and other sections of the State.

—The first section of the cast-iron shaft for the Schuylkill Company Clay monument, was put up in its proper place last week Tuesday.

—The Crystal Palace remains open until the 1st of November. During the State Fair it was illuminated every evening, and Dodsworth's Band in attendance.

—Rev. S. H. Shaw, Rector of St. Luke's Church at Laneshoro, baptized, on Sunday the 10th ult., five children, in water brought from the River Jordan.

—The Grand Jury of the U. S. District Court in New York, have indicted James Smith, Captain of the Julia Moulton, for being engaged in the Slave trade.

—The cholera is fast abating in London. Deaths for the week ending on the 15th ult. were 1,519. The total number from the commencement, 7,669.

—The Legislature of the State of Vermont assembled at Montpelier, on the 10th inst. Two elections of U. S. Senators are among the business of the session.

—Wheat is selling at $1,25 per bushel at Toronto, but at other ports down the Lake they ask $1,40, expecting daily that the duty will be removed by the United States.

—The English steamer Vulture, took to the Baltic a piece of ordnance weighing 9,500 lbs., which is capable of throwing a shot 7,000 yards—nearly four miles.

—The Pennsylvanian announces the return to Philadelphia of Gov. Bigler, and records his improved health, and the probability of his soon acquiring his wonted vigor.

—Judge Irvin, of the U. S. District Court for the Western District of Pennsylvania, died a day or two since, which makes an important vacancy to be filled by the President.

—The Mayor of Philadelphia, after consultation with the policemen, has determined that the whole force shall wear a black uniform, and a black hat, with a top of glazed leather.

—The Republicans of Mexico are said to have in contemplation a scheme to annex the United States to Mexico, the capital of the combined Republic to remain at Washington.

—Judge Benning, of the Supreme Court in the State of Georgia, has recently delivered an opinion that the Courts of that State are entirely *independent* of the Courts of the United States.

—The St. Louis Democrat charges that the Indiana banks and railroads have entered into a combination to prevent the return of the circulation of the banks of that State for redemption.

—Anthony N. Hoffman, whose death at an advanced age, occurred lately in New York, acted as the agent of Robert Fulton, when that gentleman was the owner of the first "Steamboat Line."

—Smith O'Brien is in Belgium, having arrived there about Sept. 1st. So says the Dublin Nation, though it adds, that John Mitchel is trying to persuade the public that O'Brien is still in Australia.

—The Connecticut Clock Makers are just now said to be filling large orders for China and Japan. That is the regular progress of American civilization in foreign parts—clocks first, then newspapers.

—The Bath (Me.) Mirror says that thirty-three ships are now on the stocks, or have been recently launched at Bath, Richmond, and Bowdoinham, on the Kennebec River, the total tonnage of which is 35,446 tons.

Literary Notices.

LIFE'S LESSON. A Tale. New York: Harper & Brothers. 1854.

A story of American country-life very well written, but given to the world without author's name or preface. It is a very good specimen of a class of works figuring pretty largely in our literature of late years, and will interest those who have time and taste for such reading. E. DARROW & BRO. have it for sale.

A TENNESSEAN ABROAD, or Letters from Europe, Africa, and Asia, by RANDAL MCGAVOCK, A. B.—L. L. B.

The above is the title of a racy and readable series of letters from a young member of the Nashville Bar to his friends at home, which were originally published in a Tenessee newspaper and now for the first time collected into a volume and published by REDFIELD, of New York. DEWEY, in the Arcade, has it for sale.

HARPER'S STATISTICAL GAZETTEER OF THE WORLD, No. 5, has been received from the publishers. Five numbers more will complete this valuable work. Sold at DARROW'S.

Foreign Intelligence.

Arrival of the Canada.

The steamer Canada, from Liverpool, arrived at New York Oct. 6th, with dates to the 23d ult.

The Arctic sailed on the 20th. The Petrel steamer put back to the Clyde in a damaged state.

It is officially announced by the French and English Governments, that on the 14th, 58,000 men landed without opposition at Eupatoria, and immediately marched upon Sevastopol.—The transports returned to Varna for 14,000 more French troops. The Russian fleet had again run into Sevastopol, and part of the allied fleet had arrived off Vas.

The instructions issued to the troops at Varna at the moment of their embarkation, had been published, and display evidence of the utmost care and forethought, and prove the intention of an immediate push upon Sevastopol by the combined force.

A dispatch dated Varna, 22d, says:—From Russian sources it had been ascertained that the Russians did not oppose the landing of the allies, because the entire force in the Crimea numbers only 38,000 men, besides the garrison, 2000 strong, in Sevastopol.

The Russians have 30,000 men and 48 guns on the heights, from St. Crimea to Sevastopol, and will defend these heights to the utmost.

The first conflict was anticipated about the 21st or 22d, unless the Russians advanced from their positions to meet the allies.

Ships with troops were off the fortress of Kinburn, doubtless with a view of intercepting Russian reinforcements to the Crimea. The English are said to have captured a Russian express steamer with important dispatches off Sevastopol.

VIENNA, Wednesday.—Frenden Blant states that on the 13th, all the strand batteries recently erected at Odessa were destroyed by part of the allied fleet. A powder magazine exploded.

ST. PETERSBURGH, Sept. 14.—A number of regiments have been inspected by the Emperor and marched for the campaign of the South.

CONSTANTINOPLE, Sept. 17.—While the embarcation at Varna was proceeding, a Turkish steamer up-set two gunboats and twenty Zouaves were drowned.

The fleet which left the mouth of the Danube on the 9th Sept. met with a sudden accident—two transports having foundered.

ATHENS, Sept. 16.—The French commander had demanded the reception of 2,000 troops at Athens. The King refused, declaring he would leave his capitol should the ministry accede to the demand.

MADRID, Sept. 19.—The cholera is again abating. There were only three deaths there on the 18th.

IRELAND.—A most diabolical outrage had been perpetrated in Ireland. About nine hundred of the inhabitants of Enniskillen and neighborhood, including the Earl of Enniskillen, proceeded on the railroad to Derby, on the 15th, and had a grand Protestant and Orange celebration. As they were returning, the train came in contact with a large fragment of rock, placed upon the rails near an embankment, throwing the train off the track, and instantly killing the stoker, and injuring several others, including the Earl. It is said to have been a deeply laid Popish conspiracy, and suspicion of it was entertained beforehand, and precautions were taken. The train was proceeding at a slow rate at the time, otherwise the loss of life must have been frightful.

THE BALTIC.—Sweaborg and Cronstadt are not to be attacked this season. The French Admiral and the French fleet sailed for France on Thursday. The Austerlitz got on the Stockholm rocks, and threw 21 guns overboard, and then got off again without damage.

LIVERPOOL MARKETS.—Breadstuffs—All articles are buoyant.

The Broker's Board report about 2s advance on flour, 4d on wheat, and 1s@2s on all descriptions of Indian corn.

Supplies light and the weather broken.

Richardson Brothers' quotations are: White Wheat 9s 6d@10s; Canadian 9s@9s 6d; Red 8s 6d@9s; Western Canal Flour 29s 6d@31s; Extra 30s 6d@32s 6d. Milligan quotes Ohio flour at 33s 6d@35s; Indian Corn, white and yellow, 35@37s.

Dreadful Disaster at Sea!

LOSS OF THE STEAMSHIP ARCTIC.

NEW YORK, Oct. 11—8 P. M.

The Arctic, on the 27th of Sept., came in collision with an unknown Propeller, off Cape Rice. There are only 32 known to be saved. Eighteen persons have arrived here. Captain LUCE, Mrs. E. K. COLLINS and family are among the lost.

The accident was at noon, 40 miles off Cape Rice, in a dense fog. The speed of the Arctic at the time was about 13 knots per hour, and the propeller had all sails set.

There was a strong, fair wind. It was at first supposed that the Arctic had sustained little or no injury, and assistance was immediately rendered to the propeller, which was frightfully damaged.

It was soon discovered that the Arctic was also leaking fast, and it gained so rapidly that the fires were soon extinguished. Every effort was then made for saving those on board the Arctic; but as four or five boats had left to render assistance to those on board the propeller, there was only one left which was soon filled, and a raft was hastily constructed.

A panic took possession of those on the Arctic—they crowded for the raft, and a large number reached it, others were drowned in the attempt. All this time the vessel was filling rapidly, and of a sudden she, with all remaining on board, was engulphed in the sea!

All on the raft, except one poor fellow, who clung to it, for 21 hours, were drowned.

At 5 o'clock in the P. M. of the 28th, the bark Huron, of N. B., Capt. Wall, hove in sight and took those in the boat on board—32 in number. Eighteen of them were subsequently transferred to the ship Lebanon, and arrived at this port at an early hour this morning.

Most of those saved belong to the crew.

Of passengers known to be saved, we have the names of Wm. Nicolls, Treaschoa, Scilly Islands, Henry Jenkins, do; James Thompson, New Orleans; Capt. Paul P. Grann, New York; Geo. H. Burns, Phila.; Francis Dorian, New York, 3d officer.

The five boats, which may have reached the land or been picked up, are known to have contained but one passenger, Mr. Moore of New York. The rest were officers or men belonging to the steamer.

The Arctic had 226 passengers, and a crew of 175 men. Upwards of 200 men were also seen on the propeller, whose fate is unknown.

Capt. Wall, of the Huron, however, states that on the 28th, in the morning, he descried a singular looking vessel in the distance, which, it is conjectured, may have been the wreck of the propeller.

Among those last seen on the Arctic or the raft, were Capt. Luce and son, Mrs. E. K. Collins, Master Cait Collins, Miss Collins, Mr. Brown and family, connexion of the firm of Brown, Shipley & Co., of Liverpool, Mr. Thomas, importer of hosiery, New York, Mr. Adams, of Brooklyn, Mr. Bowen, of Cincinnati, Charles Springer, do, a nephew of Mr. Bloodgood, hotel keeper, Philadelphia, residing in Albany, the Duc de Grammont, of the Embassy, with many others.

Mr. Comstock, brother of the Commander of the Baltic, was drowned by the capsizing of a boat while being lowered.

The above particulars were furnished by G. H. Barns, of Adams & Co.'s Express, Philadelphia, who had in charge Government despatches from France and England, which he could not save.

Intense excitement exists all over the city, and heart felt sympathy is expressed, especially for Mr. E. K. Collins, whose family is lost.

Hopes, however, are entertained that some of the missing boats may have been picked up or reached land, and that the list of saved may be greatly increased.

California News.

Arrival of the Northern Light.

THE Northern Light from San Juan arrived at New York, Oct. 8th, with later dates from California, and a million of dollars in gold.

In the Legislature as far as known, there are 26 Democratic to 7 Whig Senators, and 45 Democrats to 35 Whigs in the Assembly, but it is very uncertain whether the Democrats will be able to unite on any candidate for the U. States Senate. In San Francisco the Know Nothings carried everything. They elected as their own candidate for Mayor, S. P. Webb, formerly Mayor of Salem, Mass., by a majority of 539 over his highest opponent. Their ticket was only made up on the morning of the election.

On Saturday, the 9th, the 4th anniversary of the admission of California was celebrated with great pomp. The military, firemen and civic associations, turned out on the occasion, and made an imposing procession.

The removal of the head quarters of Gen. Wool to Benicia, has called forth severe animadversions upon the conduct of the administration.

Business had revived and become quite active. Every branch of industry had received an impetus, and matters were going on swimmingly again.

The ravages caused by the conflagrations throughout the State have, in a great measure, been repaired. The miners are said to be well in all sections.

On the night of the 14th, Peter Vedder, formerly of Albany, N. Y., shot and killed James Campbell, of New York. Both parties came to California with Stevenson's regiment, in 1847. Several other outrages and murders are reported.

The British and French warships Amphitrite and L'Artemise, left the harbor on the 2d, for a cruise outside the "Heads." Their destination was not known. They appear to have overhauled several merchant vessels about to enter the Harbor.

The accounts from Honolulu are confined to the celebration of the restoration of the Independence of the Kingdom. The Hawaiians were in great fear of filibusters, and the Legislature has voted $20,000 for military defence.

Everything is quiet at San Juan. In the interior Chamora still holds his position in the Plaza of Grenada, and has taken the three schooners on the lake, constituting the Costillion fleet.

Marriages.

In Caledonia, Oct. 3d, by the Rev. D. C. McAll, of Scottsville, Mr. ISAAC BUDLONG, of Perinton, to Miss HELEN S. COX, of the former place.

In Parma, Sept. 21th, by the Rev. Jonas Woodward, Mr. EDWARD H. DAVIS, M. D., and Miss H. GENEVIEVE, daughter of Dr. M. S. Cole, all of Parma.

In Ontario, Wayne county, on the 4th inst., by J. Ramsdell, Esq., Mr. JOHN ARNOLD, of Macedon, and Miss LUCY L. JENNESS, of the former place.

In Groveland, by the Rev. Thomas Aitken, of Sparta, Oct. 4th, Mr. AZEL D. GALBRAITH to Miss CATHERINE A. MILLER, both of Groveland.

In Groveland, Oct. 3d, by the same, Mr. G. WASHINGTON FRANK, of Warsaw, to Miss PHEBE T. MCNAIR, of Groveland.

In Parma, on the 3d inst., by Rev. C. Bales, Mr. CHAUNCEY D. ALLEN, of Westfield, Mass., and Miss FRANCELIA R. NORTON, of Southampton, Mass.

Deaths.

In Burlington, Calhoun county, Mich., on Tuesday morning, Sept. 26, of Congestion of the Brain, ALMIRA H. STIRLING, aged 22.

New York papers please copy.

In South Barre, Orleans County, on the 4th inst., Mrs. ELIZABETH, wife of Joseph Griffith, and mother of Mrs. Dr. J. J. St. Clair, of Marquette, Mich., aged 56 years.

Commercial.

BUSINESS AND FINANCE.

THE Northern Light, from San Juan, brought in during the week $950,431, and the Arabia took out $972,093, and the Hermann $218,000 more. The New York banks have been losing specie lately, and have reduced their discounts as a consequence, which causes some complaint of stringency in Wall street.

The amount of lands in the various Sub-Treasuries, subject to the draft of the Secretary of the Treasury, is $24,848,701.

The *Tribune* says the aggregate imports for the week amount to $1,905,230, which is twelve hundred thousand dollars less than for the same time last year. Total imports from Jan. 1st $151,133,439, which is four and a quarter millions less than in 1853.

The exports for the week (exclusive of specie) amount to $1,212,633 against $1,391,622 same time last year.

The total exports since July 1, (exclusive of specie) were $14,390,910. The exports of produce during that period, show a falling off $1,442,000.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, Oct. 11, 1854.

THERE is hardly wheat enough offered in this market to fix prices, but it is nominally held at thirteen shillings.—Other grains remain at previous quotations.

There are but few changes to be made in quotations this week, and not sufficient developments to require special comments.

NEW YORK MARKET—Oct. 9.

FLOUR—Market 25@31½c better on the medium and com. grades. Fancy and extra have improved about 12½c per bbl. Demand better for the east and local trade, and market closing with a strong upward tendency in prices. Sales at $7,25@7,5 for inferior to straight and choice State, $7,44@8,75 com. to good Ohio and mixed to fancy Mich., $8,12½@9,25 extra Ohio, $8,25@9,25 extra Genesee. Canadian flour, demand good and market firmer. Sales good com. brands supposed $7,50.

GRAIN—Wheat market firmer, with a fair demand for milling and export. Supply small, and prices tend upward. Sales good white Canadian at $1,40, on board ship, prime do at $1,48, damaged Southern at $1,30, inferior to prime white do at $1,05@1,12, red do at $1,42@1,46, prime Genesee supposed at $2, which is above the market, as white parcels can be bought at $1,83@1,88. Rye lower, with more offering. Sales at $1,16@1,19 cash and time. Barley in limited supply, and market quiet at about $1,13@17. Corn market has advanced about 2c per bush., with a fair demand for the east and export. Receipts moderate, and holders generally not disposed to sell, unless at full prices. Sales at 77@79c inferior to prime Western mixed, closing firm at inside figures. Oats in good demand. Sales at 46 @48c State, and 50@52c Western.

PROVISION—Pork market unchanged. Transactions to a fair extent. Sales of mess $12,25@31½; $11,12½@25 prime. There were sales of mess, deliverable next Monday, at $12,37½. Lard, 10½@¾. Butter, 13@17 Ohio, 17@20 State. Cheese, 9@10½c.

ALBANY MARKET—Oct. 9.

FLOUR—There is but little doing for the east, and the sales making are principally for the supply of the local trade. In prices there is no change to notice. Sales at $7,25@8,27 for com. to fancy State; $8,25@9,25 for fancy to extra Genesee; $7@8 for com. to good Western; $8@9 for extra do. Corn meal is firm and in good request at $1,56@1,62 per 100 lbs.

GRAIN—In Wheat there is no important change to notice. Sales Red Milwaukee at $1,38, Indian Genesee at $1,80. Corn opened buoyant, with a moderate supply offering. Sales good Western mixed at 78c, an advance of 2½c on the closing prices of Saturday. In Barley a fair business was done at about the current prices at the close of the week. In Rye nothing was done. Oats are less freely offered, with a moderate supply at steady prices.—Sales good State at 50c, measure.

BUFFALO MARKET—Oct. 9.

FLOUR—There is a fair demand for flour this morning, and the market is steady. Sales at $7 for good brands of Mich. and Ohio. Included are 200 brls Mich. at $6,75.

GRAINS—Wheat quiet, with very little inquiry. The only sale we note is 1,000 bush. white Mich. at $1,65. Corn market heavy, and buyers unwilling to operate at holders views. Good samples offered freely at 64c. Sales at 63½ @64c—mostly at the inside quotation. Oats quiet at 42c.

NEW YORK CATTLE MARKET—Oct 2.

AT Washington Drove Yard—Offered to-day 3,339 Beef Cattle; during the week 3,590 Prices—Beeves range from 8¾ to 11c per lb. Cows and Calves, $59 to $80@70. Veal Calves, 4 to 6c Sheep from $2@6; Lambs $2@5,50. Swine, 4¾@5c.

Advertisements.

ADVERTISEMENTS inserted in the RURAL NEW-YORKER at 15 cents a line, each insertion,—*to be paid in advance.*—Brief advertisements preferred, and we do not wish to give any one more than four successive insertions. Our space is limited, and we wish to accommodate and benefit as many applicants as possible,—at the same time interesting our readers by presenting something new, weekly.

PEACH PITS, POLAND OATS,
WILD MEXICAN POTATOES,
For sale at Walworth, Wayne Co., N. Y., by
219-2t. T. G. YEOMANS.

AN EXCELLENT FARM FOR SALE,
THREE miles from Weedsport and five miles from Auburn. It contains 128 acres of as *choice land* as there is in the County of Cayuga. It has good fruit, fences, buildings, &c. Is near a school, and in a good neighborhood. Any one desiring a choice farm, eligibly located as to markets, &c., will find it here.

PRICE, $60 per acre. Terms of payment easy. Enquire on the premises, or of the undersigned at 167 Genesee St., Auburn, N. Y. [249-3t] E. G. STORKE.

A BEAUTIFUL RURAL RESIDENCE FOR SALE.
IN Phelps, Ontario county, N. Y., ¾ mile from Oak's Corners, 4 from Geneva, 3 from Vienna. Containing 105¾ acres of excellent land, large white and convenient house, piazza on two sides, an excellent well, good cistern, small barn, &c.,—¾ acres of orcharding of the best varieties, just beginning to bear, one-half peach. Also good pear, plum, and cherry trees, asparagus bed, pie plant, 3 acres of good pasture, containing six living springs, and muck enough to fertilize the whole lot. Also 6 acres of woodland, two miles distant. This is an excellent location for a gardener, and ready market for all kinds of produce at Geneva. This property would be exchanged for an improved farm of 80 or more acres, in some healthy locality, near market, in Michigan or Illinois. This is a good locality for a Physician. There is a good office, office fixtures, a lot of medicine, &c., which, with a good horse, harness and sulkey, will be sold cheap. Price $1,800, cash down.

For further particulars address the subscriber at Oak's Corners, Ontario county, N. Y., (post-paid) and I will give the desired information. [240 1] DANIEL HIGBIE.

LEICESTER SHEEP, &c.,—AUCTION SALE.
THE subscriber having disposed of his farm, will sell at public action, at his residence, two miles Southwest from the Depot of the Canandaigua and Niagara Falls Railroad, at East Bloomfield, Ontario Co., N. Y., on Wednesday, the 25th of Oct., his entire flock of thorough-bred Leicester Sheep; consisting of 28 breeding ewes, the most of them from imported stock, 31 lambs, 5 rams, (one imported) and 11 fat wethers. Also, 5 or 6 head of young cattle, 2 cows, 3 thorough-bred Suffolk hogs (2 boars and 1 sow.) I sow and pigs, horses, waggons, harness, sleighs, all his farming tools, and some house-hold furniture. Sixteen to eighteen tons of hay, 60 bushels of Poland oats, 6 to 800 bushels of Black oats,—nice for seed,—100 bushels Canadian peas, and a variety of small articles.

This will be a rare chance for those wishing to get Leicester Sheep as I have been breeding and selecting with great care for several years. They will be sold in lots to suit purchasers. Sale to commence at 10 o'clock, A. M.

Terms liberal. T. HOSMER KELLOGG, Jr.
East Bloomfield, Ontario Co., N. Y., Oct 14. 249-2t*

"GET THE BEST." WEBSTER'S QUARTO DICTIONARY, UNABRIDGED; PRICE REDUCED TO SIX DOLLARS! Published by G. & C. MERRIAM, Springfield, Mass., and for sale at all Bookstores.

Also, WEBSTER'S SCHOOL DICTIONARIES.
Webster's Dictionary, University Edition.*
Webster's Academic Dictionary.
Webster's High School Pronouncing Dictionary.
Webster's Primary School Dictionary.
Webster's Elementary Spelling Book.

Forming a complete series of Standard Dictionaries of the language, securing uniformity in the use of language, as well as in the orthography and pronunciation.

The Definitions in Webster's School Dictionaries are taken from his large work, and combine the same excellence in this and other features, as does the latter.

One million copies of the Spelling Book are sold annually.

The leading series of School Books published in the country are based upon Dr. Webster's system.

His great work is acknowledged, as well in Great Britain as in this country, and wherever the English language is spoken, to be superior to any other.

Dr. Webster's Educational Works, it is believed, have done more to secure the uniformity of pronunciation and use of language, and freedom from Provincialisms so remarkable in this country, especially when the great influx of Foreigners from all nations is considered, than any other cause.

The attention of the friends of popular education, Superintendents, Teachers and Parents, is solicited to the importance of perpetuating this purity by the use of such a National Standard.

Noah Webster,—Professor Stowe.

Under date of May 15th, 1854, Professor Stowe, formerly of Ohio, now of Massachusetts, well known as an ardent and intelligent friend of popular education, says:

"I am decidedly in favor of Webster for the following reasons, to wit:

1. Webster is the most uniformly analogical and self-consistent.

2. His system falls in most completely with the tendencies of the language; and if in anything he goes beyond present usage, it is in the right direction, and the usage will soon overtake him.

3. He has present possession of the ground more than any other one. In the United States he is the *authority*, everywhere, except in Boston, and even there more than any other one. In England he has more authority than any other one, and is continually gaining.

4. He is the great *American Philologist*, the most learned and devoted scholar in his special department, that the English language knows; and for this reason, other things being equal, he deserves the preference.

5. If we would have uniformity, we must adopt Webster, for he cannot be displaced; but others may be."

"It gives me great pleasure to state that I have made use either of your quarto or octavo Dictionary, ever since the time of their publication, and that for copiousness, for excellinde off delineation, and adaptedness to the present state of science and literature, they seem to be the most valuable works of the kind that I have ever seen in our language. In the general principles of orthography and pronunciation, which you have adopted, I also concur, and shall endeavor hereafter to conform to them in practice."
—Pres. Wayland, of Brown University.

"I have been in the habit of using Mr. Webster's Dictionary for several years past, in preference to all others, because it far excels them all as far as I know, in giving and defining scientific terms."—Pres. Hitchcock, of Amherst College.

The above sold by WM. N. SAGE, BARROW & BRO., WM. ALLING, C. HOYT, WANZER & BEARDSLEY, and D. M. DEWEY, Rochester, and all Booksellers.

THE SCIENCE OF NATURE.
A New School Book, entitled First Lessons in Chemistry and Geology, as Applied to Agriculture.
BY J. EMERSON KENT, A. M., M. D.

A NEW school book—the first American work ever issued as the first book, or "First Lessons in Chemistry and Geology, as applied to Agriculture," designed as the first step for the young, to be used in all our common schools, is now submitted to the educational public. Some indeed protest against the introduction of all modern improvements in making the earth productive; still the great agricultural interests of our nation depend upon a rising generation of practical farmers, who will till the soil as much by a comprehensive knowledge of the laws of chemistry, as by the sweat of the brow.

The subject of agricultural chemistry cannot but soon commend itself to the world as the most important of all studies, and, in fact, the wealth of this country would be doubled within one year were all that saved which is now lost by stupid, dawdling agriculture. A volume of recommendations could be given to the public, but it is not necessary.

School Committees and Teachers will be furnished with a copy, gratis, for examination, by mail, post paid, on application to the undersigned. Price, 25 cents.

DAYTON & WENTWORTH, Publishers,
88 Washington St., Boston, Mass.

Also for sale in quantities at F. Cowperthwait & Co., Philadelphia; Daly & Burgess, New York; Phinney & Co., Buffalo, N. Y.; Darrow & Brother, Rochester, N. Y.; Wm. Wilson, Poughkeepsie, N. Y.; H. H. Halleon, Cincinnati, O.; and by all other booksellers in the United States.

N. B.—A few men of the right ability are wanted to travel through every State in the Union, and introduce this work into schools. A liberal commission will be paid. Gentlemen who travel for health or recreation will find this occupation a lucrative and agreeable employment. Address as above. 247-3t

CHEMICAL ANALYSIS.
J. BRYAN, Practical Chemist, 112 State St., Rochester, N. Y., is prepared to make *full and accurate* analysis of Minerals, Soils, Metals, Mineral Waters and Chemical Compounds, and articles suspected of adulteration and *Poisons*, either organic or inorganic, and in quantity or quality. It is necessary to send one or two ounces of a solid, and a pint or more of a fluid for examination. 241-13t

HOME PROTECTION.
TEMPEST Insurance Company, Capital $250,000, Organized December 24, 1852; Chartered March 1, 1853. Homes only Insured by this Company. No one risk taken for more than $3,000.

Many distinguished persons have insured their homes, to the amount of $3,000 each, in this Company, among whom are Ex-President VAN BUREN, Kinderhook; Ex-Governor SEWARD, Auburn.

AUBURN, May 16th, 1853.

To whom it may concern.—We are personally acquainted with many of the Officers and Directors of the Tempest Insurance Company, located at Meridian, Cayuga Co., N. Y. In our opinion they are among the most wealthy and substantial class of Farmers in this county.

J. N. STARIN,
ELMORE P. ROSS,
THOMAS Y. HOWE, Jr.

The above gentlemen will be recognized as the Cashier of Cayuga County Bank, Auburn; Postmaster, Auburn, and Ex-Member of Congress, Auburn, Cayuga County.

N. B.—The public are cautioned to bear in mind the name, (*Tempest,*) and not submit to an imposition daily practiced by two-by-four Mutual Co's.

234-1t T. R. TIMBY, Secretary.

EYE AND EAR INFIRMARY.
DR. WALKER, Oculist and Aurist, (from London, England,) may be consulted daily, and testimonials obtained at the office, 52 State St., Rochester, N. Y. 242-tf.

Poetical.

THE VOICE OF AUTUMN.

BY W. C. BRYANT.

THERE comes from yonder height,
A soft repining sound,
Where forest leaves are bright,
And fall like flakes of light,
To the ground.

It is the Autumn breeze,
That lightly floating on,
Just skims the weedy lees,
Just stirs the grassy trees,
And is gone.

He moans by sedgy brook,
And visits with a sigh
The last pale flowers that look,
From out their sunny nook,
At the sky.

O'er shouting children flies
That light October wind,
And, kissing cheeks and eyes,
He leaves their merry cries
Far behind.

And wanders on to make
That soft uneasy sound,
By distant wood and lake,
Where distant fountains break
From the ground.

No tower where maidens dwell
Can win a moment's stay;
Nor fair untrodden dell;
He sweeps the upland swell,
And is away.

Mourn'st thou thy homeless state,
Oh soft repining wind!
That early seek'st and late
The real it is thy fate
Not to find?

Not on the mountain's breast,
Not on the ocean's shore,
In all the east and west;—
The wind that stops to rest
Is no more.

By valleys, woods, and spriags,
No wonder thou should'st grieve
For all thy glorious things
Thou touchest with thy wings
And must leave.

Rural Sketch Book.

JOE BARKER;
OR, A STORY OF THE MAINE LAW.

BY T. S. ARTHUR.

JOE BARKER was weak-minded, and fond of strong drink. His earnings, not large at best, were heavily taxed by the rum shops, and his poor family, fed on the coarsest food, and clothed in multi-patched rags, were left to struggle with adversity. Joe was good-natured, even when drunk, but his weakness was, he could not pass a rum shop. He would make resolutions, when entreated by his wife; and break them when tempted by the landlord. He did not read the newspapers, and knew nothing about the Maine Law, except what he gathered from the liquor venders. Well, Joe had been, under the monitions of his wife, abstinent for a whole day, when his week's wages was in his pocket, and his throat hot with the rum thirst, he sallied out in search of a rum-toddy. His first call was at "The Diamond." It was shut up. In much wonderment he passed to Spriggs'. Spriggs' den was closed, and Spriggs himself, in answer to Joe's importunate knockings, put his head out of the window and surlily growled, "Off with you.' More mystified than ever, Joe started for Paul Dixon's. But there too, all was dark and silent. Joe was utterly amazed; and commenced retracing his steps, but not taking good heed thereto, he ran against a pump.

"Hi, hi! what's the matter now?" ejaculated Barker, moving back a pace or two, and trying to re-link the broken chain of his thoughts.

"Only the pump! I've had many a cool drink here in my time both as boy and man; and it never cost me a cent, nor made me more of a fool than some people say I am by nature. Good evening Mr. Pump! Let us shake hands or handle, just as you please, for old acquaintance sake. I've been trying to get a drink this half hour, but not a drop to be got for love or money. The rumsellers have all shut up shop, it seems: I hope you are not on a strike too. Let's see.

Joe lifted the handle, putting the iron ladle under the spout as he did so, and brought it down with a strong jerk. Out gushed the crystal water, looking clear and beautiful, even in the feeble starlight. It filled the ladle, overran its side, and went splashing down the pavement. There was something pleasant in the sound, even to the dull ears of Barker; and there was a feeble awakening in his mind of the dear old memories of boyhood, and the early times when he was a better man.

To his mouth he placed the brimming ladle, and drank a pure draught of the nectar. Just as he had removed the vessel from his lips, and had taken a deep inspiration, a hand was laid on his shoulder familiarly, and a friendly voice said—

"Cheaper drinking, that, neighbor Barker, than was ever found at the 'Diamond,' across yonder, and a thousand times better in the bargain. I'm glad to see you are returning to your old friend again, and hope you will never have occasion to desert him. Friend Pump is worth a score of your Spriggs. What a blessed thing you are forever rid of their friendly offices."

"Forever rid of them?" said Barker. "What does it all mean, neighbor? What have they done? Has any one been murdered?"

"Murdered! No, not exactly that, but didn't you know that the old villain Alcohol died last night?"

"Died! what? I don't understand." And Joe Barker looked more bewildered than ever. "Died! How?"

"Why Joe Barker! is it possible you don't know the Maine Law went into operation in our State to-day?"

"The Maine Law!" Joe took off his old hat and laid one of his broad hands upon his forehead. *The Maine Law!* I heard them talk about one last election. They said it was a dreadful outrage on our liberties, over at the 'Diamond,' and so I voted again it. What does it do, neighbor? Will it shut up all the taverns?"

"That's just what it has done already. You can't buy a drink of liquor in the whole town."

"You don't tell me! Good, say I to that! Well, I couldn't make it out no how. I tho't something strange had happened. All shut up? Ho, ho! Spriggs said it would be the ruination of the town if the law passed. I rather guess he thought there was nobody left in town to be ruined except rumsellers. And you're sure every tavern has been closed?"

"I know it," was the decided answer.

"Then I'll run home and tell Betsey. But won't she be glad."

And away the excited creature ran, as fast as his legs would carry him.

Poor Betsey Barker! When she found that Joe had gone off with all his week's wages in his pocket, she felt like giving up. They were out of meal and meat, and the children's shoes no longer kept their feet from the ground.—For herself, she had not a garment but what was patched and re-patched until scarcely a whole breadth of the original fabric remained. She had laid it all out in her mind how she was going to spend the four dollars which her husband told her, in the morning, he would be paid for his week's work. It was a very small sum when set off against her many, many needs; but she had apportioned it, in her thoughts, in such a manner as to make it go the farthest in supplying things absolutely necessary. But, alas, Joe had gone off with the whole sum in his pocket, and she knew the chances were ten to one that he would not have the half of it left—perhaps not a dollar left—when he came home.

The poor wife was disheartened; and who can wonder? She cleared off the supper things and then sat down to mend an old jacket belonging to her eldest boy. As she turned it over and over, and noticed how torn and worn it was—more fit for the rag-bag than anything else—she let it fall into her lap, and, bending over the table by which she was sitting, buried her face in her hands. She did not weep, her feelings of despondency had in them too much of hopelessness for tears.

As she sat thus, the door opened, and her quick ears recognized the footsteps of her husband. Her heart fluttered instantly with a new hope, while half the oppressive weight on her bosom was removed. His return, so early and unexpected was an augury of good. That he had been drinking, she doubted not; but there was ground for believing that he had not wasted the money she so much needed. She did not raise her head until Joe came up to where she was sitting, and, in a tone of exultation which he could not repress, exclaimed—

"Hurrah, Betsey! Good news! There is all my money—not a cent gone!"

And he threw a handful of silver coin on the table. "Good news! What do you think?—Old King Alcohol's dead; I've just heard the news."

"Are you crazy, Joe?" said Mrs. Barker, looking in wonder and bewilderment at her excited husband.

"Not a bit of it, darling!" answered Joe, as he threw his arms around his wife's neck, and kissed her. "Nor drunk either," he added, as she pushed him away. "Why Betsey, don't you know that we're got a Maine Law? I've been to Gilbert's and Spragg's, and to Dixon's, but they're all shut up. Tompkins told me that a drop of liquor couldn't be bought in the whole town. Ain't that good news for you, old girl? Hurrah, boys! I'm as glad as if I'd found a new dollar. I never *could* pass their doors without going in for a drink, whether I wanted to or not. Somehow or other I couldn't help it."

"Joe, Joe! is this all true what you say?" exclaimed Mrs. Barker, now pressing forward upon her husband, and drawing, almost involuntarily her arms around him. "*Is it all true, Joe?*"

"Every word of it, as I'm a living man."

"Thank God! thank God!" was the overjoyed wife's response, as her face fell upon the bosom of her kind-hearted, but weak and erring husband.

A month from that time, and what a change was visible in their humble dwelling. And not in their's alone, but in thousands of other dwellings throughout the State, from which prompt legislation had driven the vile traffic, with all its attendant crime and wretchedness.

"THIS FARM FOR SALE."

IN the course of a ride, out among the rusticities, where air smells of clover, the foliage is fresh, and the birds are not afraid, we came across a sign which bore the above inscription. It was not lettered in a style which Wilgus or Smith would select as a model, but the characters were sufficiently plain to answer the object intended; on the same principle that one can as well understand the English language when it jumps from the mouth of the untutored boor, as when it murmurs on the velvet lips of the languid beauty.

The inscription took the form of a text, at once—and, straightway, a mental sermon succeeded, which we will recall and jot down, as our memory serves us:

Why sell the farm? It looks in excellent condition. Were it a female and not a farm, it would hurt somebody's heart grievously.—Instead of being offered, it would be sought after, and as only one out of a hundred suitors could prevail, there would be ninety and nine statues of despair reared in ninety and nine bosoms. We cannot see how a man whose discrimination is not blunted can part with such a farm. Its owner must be a prince.—From its fertile heart cometh sustenance in abundance. It beareth corn and fruit—sheep wander in its valleys, cattle browse on its hillsides. The chatter of fowls and the neighing of horses are heard from its yards and its meadows—its garden is full of fatness, and the grape vine laden with promising clusters, festoons the nursery wall. Everything betokens fruitfulness and plenty—of which the dissatisfied farmer is owner and lord. What earthly reason can he have for wishing to sell it?

Why sell the farm? Has his owner become ambitious as well as restless? Has he read in books and newspapers of some far off land where money lies upon the turf, and all you have to do is to stoop and take it? Does the glitter of Australia haunt his eye, his mind, his dreams? Or does he regard himself as rich enough to move into the city, and spend in luxury what he has earned by unflinching toil? Well, human nature is full of freaks.

If there is one adage that is truer than another, it is the one that says "a man never knows when he is well off." A farmer—staunch, well-to-do farmer. Why, he is the very King of comfort. Health, enjoyment, independence hide among his grass and nestle in his tree-tops. He needs not to sigh for Australia, when his own soil teems with profit. He need not travel for gold when he may dig it in his fields. And as for the city, it is a great deal better to visit it now and then, than to make it a continual abiding place. It is infinitely better to be a guest than a resident.—These are gospel inferences—and the farmer will find them so.

Why sell the farm?—Strange that we shou'd pass an unpretending churchyard just at this moment and that our unconscious eyes should fall upon a new made grave. Perhaps we have been too hard with the farmer, after all. That very mound, so freshly heaped, may be the secret of his discontent. It is not the grave of a child; its proportions do not correspond with the "little earth" to which a youngling or a youth is entitled. There is no stone yet raised to tell of its occupant—but somehow, we cannot help thinking that the farmer's wife sleeps there. Forgive us, that we did chide thee, good and honest friend. We do not blame thee now. That rude inscription, "This house for sale," now stands as sponsor to a volume of suffering.

Why sell the farm? Because it is home no longer. The dear old house seems gloomier than a prison, for that, but now, an angel passed its threshold to return no more. The beauties and comforts it possessed are changed to clouds and ashes—the air, that haunts its foliage and skims across its meadows is full of melancholy meaning. The tree has fallen, and the vine has nought unto which to cling. So sell the farm, most worthy friend. Would to heaven the bargain might include thy sorrows.

The commonest records are often invested with awful eloquence. If we will but dive beneath the surface we may bring up a handful of pearls.—*Buffalo Express.*

THE CHARTER OAK.

ALL our citizens venerate the Charter Oak, the grand old tree that so completely shielded the written charter, which continued to be our organic law until 1818. In song and story the old Oak is made famous, and thousands of strangers from abroad annually visit it. The tree stands upon the Wyllys place, now owned and occupied by the Hon. I. W. Stuart, who has kindly cared for it. A few years since some boys kindled a fire in its trunk, which burnt out most of the rotten parts of it. Mr. S. soon discovered the fire, and at once had it put out. He then, at considerable expense, had the hollow inclosed by a door, with lock and key. He also had the stumps of branches that had been broken off covered with tin and painted. The tree, from this time seemed to be imbued with new life—each succeeding spring dressing itself in a richer and denser foliage. On the 22d inst., the New Haven Fire Companies, who came up to join their brethren in Hartford, on the occasion of their annual muster, visited the famous oak. They were, of course, kindly received by Mr. Stuart. To show them the capacity of the tree he invited the firemen to enter the hollow trunk, when twenty-four of the men belonging to Capt. McGregor's Company (Neptune No. 6.) entered together. They came out, and twenty-eight of Capt. Thomas' Company (Washington No. 6,) then entered. By placing twenty-eight full-grown men in an ordinary room of a dwelling, one may judge of the great size of the famous old Charter Oak.—*Hartford Times*

A SLIGHT MISTAKE ON BOTH SIDES.

THE other day a person who is somewhat of a linguist, speaking French fluently and Spanish tolerably well, found himself in company with two other travelers in a stage that was conveying them from Peershill to Carmel.—The strangers were conversing in German, and one of them alighted at a farm house mid-way between two villages. Our friend was left with the other traveler as his companion for the journey. The conversation between the two friends had been lively and the silence that ensued when the aforementioned traveler left was painful. At last our hero thought he would endeavor to get up some sort of conversation in order to beguile the time.

"*Parlez vous Francais, Monsieur?*" said he, addressing the supposed German.

"*Non, no, entendez,*" replied the other, "*Canst sie Deutch sprechen?*"

"*Nicht,*" replied our hero with a shake of the head; but he added, "*Habla V. Espanol?*"

"*Si, Senor, poco,*" replied the traveler, and a sort of mongrel conversation in tolerable indifferent Spanish, was maintained between the two until the stage stopped at its destination, when both travelers prepared to alight.

"Take care of my baggage, Jim," shouted the supposed German in unmistakable vernacular, to the driver, as he stepped on the stoop of the hotel.

"What, sir! do you speak English?" asked our hero in a tone of surprise, "I thought you were a German."

"To be sure I do. I ought to. I'm a Bostonian, but I thought you were a Frenchman!"

MAN, while he loves, is never quite deprived

Youth's Corner.

ILLUSTRATED REBUS, NO. 43.

☞ Answer in two weeks.

[Written for the Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I AM composed of 51 letters.

My 49, 24, 5, 46, 41, 17, 32 is a violent gust of wind.

My 20, 1, 30, 10, 52, 10, 1 is a person appointed to hear.

My 8, 18, 13, 3, 19, 42, 12, 44, 38 is excellence unequalled.

My 33, 6, 19, 41, 21, 31, 45 is union.

My 37, 11, 22, 17, 8, 36, 9 is brief.

My 11, 6, 27, 41, 29, 11, 16 is a Turkish vehicle.

My 23, 7, 39, 6, 25, 26, 16, 29, 13, 5 is a worshiper of the sun.

My 18, 2, 9, 51, 26, 15, 6, 31, 52 is more elevated.

My 34, 28, 5, 14, 37, 28, 21 is an excess.

My 35, 50, 36, 21, 29 is a game at cards.

My whole will be found by all to contain truth.

Root, N. Y., 1854. O. H.

☞ Answer next week.

CHARADE.

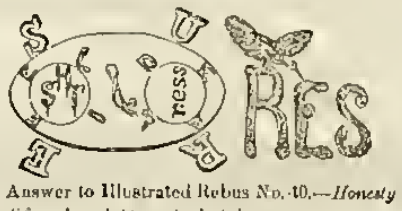
My first two letters show the man,
So do my fire—to whose last three
Are owing many a plot and plan
Of wisdom, wit, and knavery.

My four first would exhort in vain
If their three last should be dead letters;
My five last all the world contains,
And even bind the arm in fetters.

I'm quite at home in letters six—
To friendship warm, to coldness hateful;
And still th' inconstant heart I fix.
That without me would be ungrateful.

(Blackwood's Mag.

☞ Answer next week.



Answer to Illustrated Rebus No. 40.—*Honesty in life and uprightness in deal, insure respect.*

Answer to Miscellaneous Enigma in No. 40.—*In the name of the Great Jehovah and the Continental Congress.*

Answer to Charade in No. 40:

It were a folly to deny
A speculation to the eye,
And 'tis as clear as rye can speak
In language sure as Stiggins' Greek.
Yet, though it speaks, is mostly under
A brow that looks it speaks not thunder;
Such brow as Hunter gave to Zeus
When he was press'd as was his use,
'Mong gods and men to play the deuce,
Thus rye and brow, tho' seeming two,
United execution do.
Like thunder first announced by flashes,
Our ills by frowns, our kills thro' lashes!
And yet they do so surely pair,
They rail each other to a hair.
The rye-brow—what would it be only
Without one?—like—why let us see!
Its eyes like jewels badly set,
A house without a parapet,
A window without architrave.
The sea without a curling wave—
The finest features lacking rye brow,
Would not be worth a single flybiow;
Beauty herself, without its aid
To lend the modesty of shade,
No better than a barefaced jade

Wit and Humor.

MERELY A TRANSPOSITION.—"Wouldn't you call this the calf of a leg?" asked Bob, pointing to one of his nether limbs, rather compactly encased in representations of harlier poles and running vines. "No," replied Jim, "I should say it was the leg of a calf."

"How are ye, Smith?" says Jones.

Smith pretends not to know him, and replies hesitatingly,

"Sir, you have the advantage of me."

"Yes I suppose so; everybody has that's got common sense.

A FRIEND said to another, on seeing a handsome equipage waiting in the street, "I should like a drive out, wouldn't you?"

"Get in," replied the wag, "and I'll be bound for it, they'll soon drive you out."

THE briefest charge to a jury in an action trial, was given by one of the courts. It was as follows:—"Gentlemen, if you believe all the testimony in the case, your verdict should be for the plaintiff."

THERE are two reasons why you should not interrupt an editor when he is writing. One is, it is apt to put him out—the other is, you might get put out yourself.

A WESTERN paper speaks of a man who "died without the *aid* of a physician." Such instances of death are very rare.

Fairfield Classical Academy and Female Collegiate Institute.

REV. L. D. STEBBINS, A. M., PRINCIPAL.

THIS Institution is located at Fairfield, Herkimer Co., N. Y., upon a beautiful range of hills, in one of the healthiest villages in the State, and is reached by a line of stages from the Central Railroad at Little Falls and Herkimer, by a collateral road. It has for more *fifty* years of faithful instruction and good discipline, attained a large reputation. Its libraries and Apparatus are hardly equalled by any Academy in the State.

It has 3 large, commodious buildings all in a pleasant grove. Its Faculty is large and competent. The Female is a gentleman of superior qualifications. The first term will begin November 8th. Board, room furnished, fuel, washing, incidental expenses, tuition in common English, only $19 per quarter. Conveyance free from Rochester, Auburn, Syracuse, Waterloo, &c., if fare being remitted on payment of Tuition. There is a complete graduating course for Ladies, and full courses for young men for business and College, and teaching. For the Latter there is a large Gymnasium for daily exercise.

For circulars and rooms, address the Principal at Fairfield, Herkimer Co., N. Y. J. SMITH, Pres't.

LAND PLASTER

AT Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.
217-3m. JIBER ROWLEY.

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

THE WOOL GROWER AND STOCK REGISTER is the only American journal devoted to the important and profitable branches of *Wool and Stock Husbandry.* It contains a vast amount of useful and reliable information on the above and kindred subjects, and should be in the hands of every owner or breeder of Sheep, Cattle, Horses, Swine, or Poultry—whether located East or West, North or South, for the most of the matter given in its pages is equally adapted to all sections of the Union, the Canadas, &c. The Sixth Volume, commencing July, 1854, will be

Enlarged to 32 Octavo Pages Monthly!

And improved in both Contents and Appearance. Among other matters of interest to Wool Growers, Breeders, Graziers, Dairymen, &c., the new volume will contain PORTRAITS OF PURE-BRED CATTLE, Horses, Sheep, etc., and the Names and Residences of the principal Breeders and Owners of Improved Stock throughout the country. It is published in the BEST STYLE, AND ILLUSTRATED WITH MANY ENGRAVINGS—including Portraits of Domestic Animals, Designs of Farm Buildings, &c., &c. Three useful HEADINGS OF THE WOOL AND CATTLE MARKETS, given in each number, are alone worth many times the price of the paper.—To Wool Growers this feature is invaluable.

TERMS—Only Fifty Cents a Year!

Five Copies for $2; Eight for $3,—*in advance.* Any additional number at 37½ cents per copy. Club papers will be sent to different post-offices, if desired. ☞ Back volumes (well bound in paper, for mailing) furnished at above rates.

☞ NOW IS THE TIME TO SUBSCRIBE and form Clubs. Money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

☞ Mr. C. MOORE, of Gerry, Chau. Co., is authorized to act as Agent for the RURAL NEW-YORKER, and for the WOOL GROWER AND STOCK REGISTER, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 26 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $2,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

☞ The postage on the RURAL is but 2½ cents per quarter, payable in advance, to any part of the State—and 5½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. BIXBY,—H. C. WHITE,—T. E. WETMORE.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete AGRICULTURAL, LITERARY and FAMILY NEWSPAPER.

☞ FOR TERMS, &c., SEE LAST PAGE. ☜

Rural New-Yorker.

Progress and Improvement.

MANAGEMENT OF BARN-YARD MANURE.

WE gave a series of articles on this subject, in the last volume of the RURAL. In them we asserted that by judicious management all the ammonia might be retained in the manure without the application of any of the so-called fixers. Mr. S. W. JOHNSON, who is now a student at Munich, under the celebrated LIEBIG, translates for the *Country Gentleman* a series of able articles from the German of Prof. WOLFF; the last is on the "Fixing agents in connection with liquid manures," and we are pleased to find our opinion confirmed by such high authority. He considers "the addition of chemical fixing agents to the mass of yard manure as unnecessary," and further "that where yard manure and composts are skillfully prepared the loss of ammonia is very slight, even without the use of fixing agents."

In our articles, however, we recommended the construction of a large tank for the reception of the drainings of the yard. Into these drainings as much sulphate of lime or plaster was to be thrown as they would dissolve. The reason of this was that sulphate of lime in solution will convert the volatile carbonate of ammonia into the fixed sulphate of ammonia, while it will not do so in its dry state. This solution of sulphate of lime, when pumped back again in dry weather, not only serves to check excessive, injurious fermentation, but it converts the carbonate of ammonia in the mass into a fixed sulphate, and thus renders the loss of ammonia from volatilization almost impossible. We still think this method equal to any other we have seen suggested.

Professor WOLFF recommends substantially the same process; he thinks the drainings of the tank should be pumped back upon the mass, and that they would be improved upon by adding green vitriol, (sulphate of iron) or, where this is costly, dilute sulphuric acid, or even plaster of Paris to the collected liquids in quantities sufficient to fix their ammonia, which may then be used to drench repeatedly the solid portions. In this country, plaster is decidedly the cheapest substance that can be used for this purpose. Professor WOLFF says, "in England sulphuric acid is preferred." This may be so theoretically, but the *practice* is not at all general. In fact we have never seen it used except in more than two cases,—MECHI, on his Tiptree farm, and the Royal Agricultural College at Cirencester, and this while sulphuric acid is cheaper, and plaster much dearer than with us.

As showing the extent to which ammonia may be lost when common liquid manure is allowed to ferment, unmixed with the fixing agents, the experiment of D. KNUTZSEK is quoted. He found that the solid residue remaining after the evaporation of perfectly putrid yard liquid, gave 3½ per cent. of ammonia; while the same liquid, treated with an acid (fixer) before evaporation, gave a residue which contained 12½ per cent. of ammonia. In the Rothamstead experiments, if we recollect right, sheep urine, evaporated without acid, lost even a still greater amount of ammonia.

Yet we should be careful how we apply such results to common practice. It is known that water will hold a large quantity of ammonia, and we believe the loss of "this spirit like essence of the farm, ever struggling to be free" from fermenting common barn-yard drainings, is vastly less than the above figures would indicate. Yet it is sufficiently great to warrant the use of any CHEAP method of fixing it, such as the one we have suggested.

FINE AND COARSE-WOOLED SHEEP.

IT is with sorrow we learn, what, however, we had anticipated, that thousands of sheep in every part of the country are being sold at about a dollar a head, and slaughtered for tallow. The low price of wool, the extreme drouth of the past summer, and the high price of hay and grain of all kinds, are the principal causes of this result. But farmers, as well as other men, are short-sighted mortals. They do not *think*. Wool-growing at 30 to 35 cents per lb., is not as profitable as wheat-growing at $1,50 to $2,00 per bushel. This is sufficient to induce multitudes to abandon the former and rush into the latter. Forgetting the past and mindful of the future, the wool-grower sacrifices his sheep by thousands, because, forsooth, they have not this year been quite so profitable as some other branches of farming.

But what would you do? Will wool be any higher next year than it is now? And will it pay to keep our sheep, when hay, stalks, and all kinds of fodder and grain are so scarce and high? We do not know that wool will be any higher next year. Wool, like everything else in an intelligent community, will sooner or later find its level. If fine wool cannot be raised for less than 50 cents per lb., the supply will fall off till that price is obtained. We desire simply to guard wool-growers from being too precipitate. If fine wool-growing this year has not been so profitable as usual, don't sell your sheep at ruinously low prices, and thus make the matter worse. There may be a difficulty in wintering as many sheep as usual, but economise the fodder as much as possible—cut up all your corn-stalks, straw, &c., and use a little grain or oilcake—give the sheep dry, warm and comfortable quarters, sell off only such sheep as are old and worthless as breeders, and our word for it, you will be the gainer.

Till within the last month or two, we have paid in this city from eight to twelve cents per pound for what is facetiously called "lamb" or mutton. In New York and other large Atlantic cities, mutton or lamb has been much higher. In fact, mutton worthy of the name could hardly be obtained at any price. We believe the large hotels had standing contracts for "South-Down mutton," at *twenty-five cents per pound*. It will doubtless be the same this time next year. We call the English beef-eaters; it would be much nearer truth to call them *mutton*-eaters. Professor NASH, in his letters from England, alludes to this fact, and accounts for it by saying that their beef is much inferior in quality and fine flavor to that of our corn-fed cattle, while their mutton is in every respect much superior. The latter proposition is unquestionably true. Who that has been in London, has not some savory recollections of mutton chop,—to say nothing of a glass of BARCLAY & PERKINS' "Stout." We never knew an American visit England without falling in love with English mutton. From this we are fully satisfied that *good* mutton will find plenty of customers at remunerative prices in this country.

No one can question but that the "long" or "middle"-wooled sheep will mature earlier, fat easier, and afford more, not to say *better*, mutton for the food consumed than the fine-wooled breeds. It is well known that *elaboration*, or highly organized matter, whether vegetable or animal, is obtained only by a great consumption of matter or force. In a *scientific sense*, therefore, fine mutton or fine wool can not be raised as cheaply as coarse mutton or coarse wool. The South-Downs are probably the fairest and most highly organized breed of mutton sheep, and the Cotswolds the coarsest. And we know from actual experiment that much more mutton and wool, such as it is, can be obtained *for the food consumed*, from the Cotswolds than from the South-Downs. And it is probable that Merinos, being a still more highly organized breed than the South-Down, would require still more food for the production of mutton and wool. Fine mutton and wool, therefore, must command a higher price than coarse, or they cannot be produced. But we must not dwell on this idea.

Mutton is in demand. In a year or two fine wool will also be in demand at fair prices.—Now it will not be politic to sacrifice your fine-wooled sheep and buy mutton sheep, for before you have many ready for the butcher, fine wool will be again in the ascendancy. A wiser course would be, we think, to carefully examine the flock, and select out every worthless animal for immediate disposal. All the wethers that were tolerably fat, should be placed by themselves and allowed a liberal diet. Before next February they would command a high price for the butcher. The ewes we would divide into two lots. If the flock is derived from the common stock of the country, crossed with fine-wooled bucks, you will find some ewes with much finer and heavier fleeces than others, which rather exhibit a fat-forming tendency. The former should be placed by themselves, and at the proper season run with a fine-wooled buck. The others we should put immediately to a coarse-wooled buck. Coming about the first of April, provided with dry, comfortable quarters and nutritious food, such lambs, if we may judge from the past, will be worth by the middle of June in any of our large cities *from three to five dollars a head*.

This is not theory. Many farmers in this vicinity adopt such a method, and find it exceedingly profitable. They think the mutton from such a cross—say Leicester and common Merino—is better than that from the pure breed. This we can believe. They also assert that the lambs are stronger and healthier, and fatten quicker. This, however, is not so probable, especially in relation to fattening and early maturity.

It will of course be understood that we do not recommend breeding from such a cross, but simply raising them for the butcher. We know intelligent farmers, however, who are taking a flock of common sheep and crossing it with Leicester bucks, with the intention of breeding from the progeny, and who hope, thus, in a few years, to get a flock of superior mutton sheep. We fear they will be disappointed. Such cross-breeding generally leads to deterioration of the good qualities of the original breeds. However, they have our best wishes for success. We shall be interested observers. If any of our readers have experience in the matter, we should be pleased to hear from them.

DURABLE FENCES.

THE *Michigan Farmer* for September has an article from Mr. A. B. MARKHAM on "Mortar Houses and Fences," in which he describes some successful experiments in the use of gravel for erecting these structures. His fences have stood six years, without any crumbling, cracking or decay of any kind. To all appearance he says they are harder than ever. In building fence-wall he uses one third water-lime. He digs down about one foot, lays in large stones, banks up to the top of these foundation stones, and then begins his gravel wall on this foundation. He uses boxes to confine the mortar until it becomes stiff or hard, in the same way as when constructing house wall.—He makes the mortar quite thin, and then crowds in all the stones, large or small, which can be conveniently come at. To two bushels of stone lime, he puts about forty to fifty pailsful of water, and one bushel of water-lime.—These he stirs and mixes well, and then adds forty-five to fifty bushels of gravel,—less when the gravel is fine, and more when it is coarse; as the finer the gravel, the more lime is necessary to make a good cement. Mr. M. has made fences in this way with lime alone, without the addition of water-lime, but finds that they do not stand well.

TAKE a pleasant afternoon and go and see how others are managing their farms.

GROUP OF POLAND FOWLS.

ABOVE we present an engraving of a fine pair of Poland or Top-knot fowls, one of the best varieties for the abundant production of eggs, and at the same time of fair size and good quality for the table. A friend who has tried all kinds of poultry, tells us that the Polands are very good layers, and but little inclined to set, sometimes not one in ten showing any disposition that way. They cease laying occasionally—recruit for a few days—are cheerful and sprightly—and then commence laying again. With a warm basement room for winter, admitting daily the cheering rays of the sun, they would lay every month in the year. Our picture shows them as a very handsome variety of fowls.

THE OREGON PEA.

GLOWING accounts have been published of this new plant, and considerable inquiry elicited for further information. For a Southern latitude, it may be all that is claimed for it.—But hereabouts, those who undertake its cultivation, we opine will be much disappointed.

The writer received samples of this pea from three or four different sources the past winter, a portion of which he planted out the 6th of May, alongside the Japan Pea and a Stock Pea from Mississippi, on soil but moderately rich. The plants came up well and made a tolerably fair growth, but not equal to either of the other kinds. Not a vestige of a flower had made its appearance on the 21st of Sept. when we had a frost that killed the plants, while the Stock Pea had ripened a few pods, and the Japan had so far matured a portion of its fruit as to leave no doubt of its vegetative power. In fact the Japan was but little affected by the frost which completely killed the foliage of the Oregon Pea. Like the Japan the stalks and branches of the Oregon are half woody, but not of so vigorous a growth.—Neither were at all, apparently, affected by the drouth, but presented a green and thrifty habit. The plants of both varieties have more the look of giant bush beans than of peas—the Japan having much the largest leaves, which with the stems, pods, &c., are hirsute. It may be the Oregon is an excellent renovator of the soil, but where one will have to depend on seed from a distance, it seems our northern farmers can find other plants more reliable, better tested, and far cheaper. T. E. W.

THE POTATO DISEASE IN IRELAND.—We continue to receive the most conflicting accounts in regard to the extent of the potato disease in Ireland. Some of the Irish papers state it to be worse than in any year since 1846, while others say the crop is scarcely injured at all. It is probable that the disease is much worse in some districts than others.

CARBONACEOUS MATTER IN THE SOIL.

MESSRS. EDS.—I am glad to learn in the RURAL of the 14th October, the probable mechanical and chemical value of carbonaceous matter in the aerated soil, as proved by the eleven years of experiments on the Rothamstead farm. These experiments, as I understand them, show—1st. That the atmosphere cannot supply ammonia sufficient for a maximum wheat crop, yet, if nitrogenous matter is supplied to the soil to make up the deficiency, the atmosphere will supply whatever the soil may lack of carbonic acid for a maximum crop of wheat. 2d. That in the same soil where there is carbonic acid enough to supply forty bushels of wheat to the acre, with the aid of that from the atmosphere, there is only nitrogen enough in both soil and atmosphere to give seventeen bushels of wheat to the acre; hence the application of nitrogen to the soil is indispensable to a full wheat crop, when carbon is not. 3d. That turnips require less nitrogen than wheat, but more carbonic acid than the atmosphere, rain, and dew can supply; hence a carbonaceous soil is as necessary to turnips as a nitrogenous one is to wheat.

Every New York farmer who has attempted to grow wheat on newly cleared beech and maple land, will endorse the above experiments; because on new land the carbonaceous matter induces a large growth of straw at the expense of the cereal crop, while it is on such mucky soils only that English turnips can be grown with success in Western New York.—But after the humus or carbon in the soil is reduced by cropping, the cereal yield is greater and the straw less, provided always that the nitrogen and the calcareous principle in the soil is not also exhausted. What a pity that our cereal King, Indian Corn, was not also indigenous at Rothamstead farm, so that the truly learned, practical and indefatigable Mr. LAWES might experiment with a plant which assimilates alike carbon and nitrogen, with an appetite so omnivorously gross and indiscrimi

unte as to imitate the hog of the animal kingdom; but with the great advantage of its tenfold usefulness as an edible to sustain both man and beast, biped and quadruped?

Indian corn never *runs* too much to stalks, as the farmers say wheat does to straw, when the land is new and full of carbonic acid; yet to produce a maximum cereal yield of corn, ammonia in the soil is as indispensable to the corn crop as to the wheat crop. You are undoubtedly right in ascribing the large corn crop in the drained swamp referred to as much to the presence of ammonia as to carbonic acid, both of which would have failed to have made a large crop, in this season of continued drouth, but for the mechanical aid of the soil, which retained water in that equable supply for the wants of the plant, that there was no lack even after the wells in the neighborhood had become dry.

If, as Schubler says, humus imbibes 100 per cent of water, while sand only imbibes 25 per cent, the mystery of the great corn crop this dry season in the great, partially drained Waterloo swamp, is no longer a mystery. Hence it must be admitted that Liebig's theory of the power of carbonic acid to increase vegetable growth, is only correct, if we take into the account its mechanical as well as its chemical aid and effect to both soil and plant.

Waterloo, N. Y., October, 1854. S. W.

TOWN FAIRS.—LE ROY AND PAVILION.

The most appreciable and decidedly *enjoyable* Fairs we have attended this season, have been those of Town Agricultural Societies, and such as comprised only two or three Towns—The Phelps Fair, heretofore briefly noticed in the Rural, was highly creditable in many respects—while the show of the Union Ag. Society (comprising the towns of Phelps, Manchester and Hopewell,) was well attended, and not altogether uninteresting. The show of horses was very fine. The address, by Rev. Mr. Conrad, was able and appropriate. We have favorable reports concerning the exhibitions recently held by other Town Societies, and can speak of two or three from personal observation. For instance, we had the pleasure of attending—

The Le Roy Town Fair, held on Wednesday of last week,—and the show of the Pavilion and Corington Society, the day following. These exhibitions were better than many anticipated under the circumstances—a Menagerie and other side shows competing with *the* Show at Le Roy, and the weather being unfavorable on the day of the Pavilion Fair.

Our Le Roy friends made an excellent show of Cattle, particularly Durhams and their grades. The President of the Society, C. K. Ward, Esq., exhibited some superior animals, both full bloods and grades. Mr. Murray, D. Ward, Jr., H. Holmes, and others whose names we could not ascertain, also had fine blood and grade animals on exhibition. The display of working oxen, steers, &c., was decidedly superior for a Town show.

There were but few horses shown, though we noticed some fine teams, and several good colts. D. Ward, Jr., exhibited a very fine draught stallion—said to be a cross of the Sampson and Morgan breeds.

The show of Sheep was not large. N. B. Kenne, however, had several pens of superior coarse wooled sheep—principally Leicesters and their grades, we believe. Of Swine there was a fair show—including very good specimens of the Suffolks and Lincolnshires. The Fowls were not forgotten, as the display of several coops, embracing different varieties, attested.

The display of implements was limited. C. R. Brinckerhoff & Co., of Batavia, exhibited their patent self-holding, furrow-gauge Plow—a new and superior Corn Cultivator, with reversible mould boards—and Davis's Corn Planter. The Plow has the appearance of being a capital implement, and the fact that some five hundred have been used the past season, and none returned, augurs that it performs satisfactorily. Seymour's Grain Drill was shown by the agent, Mr. Gillet, and attracted deserved attention.

Of Fruit the exhibition was very fair—especially of apples, pears, and grapes. By the way, we noticed that in portions of Le Roy and Pavilion through which we passed, the yield of apples appeared more prolific than in the sections of Monroe, Ontario and other counties we have recently visited.

The display in the Ladies' Department was not extensive, but highly creditable, particularly in embroidery, wax and needle work, &c.,—combining, as the "fairer portion" always do, the useful and the ornamental.

On the whole, though not, we are assured, equal to former ones, the Fair was most interesting, and well attended. The attendance in the evening was large, and it is a source of regret to the writer that a more capable person was not selected to address such an assemblage. Our Le Roy friends have, however, learned that it is not the *forte* of at least one Editor to "speak in public on the stage," albeit he is determined to "try again," though before a less discriminating audience! The spicy and interesting discussion which ensued, and the resolution adopted by the Society relative to holding regular meetings to discuss practical subjects, made some amends for the inauspicious opening of the evenings proceedings.

—We cannot close our notice of the Fair, without expressing the pleasure experienced in revisiting the beautiful village of Le Roy, and the fine farming region by which it is surrounded, and more than all meeting hundreds of intelligent and enterprising friends of improvement. The kindness and hospitality of Le Royans will long be gratefully remembered.

The Pavilion and Corington Fair (held at the former place,) excelled in showing fine cattle, notwithstanding the unfavorable weather. In other departments we observed nothing particularly noteworthy, except the *persons* in attendance. Indeed the enterprising and progressive men and women who attend are, to us, among the most interesting features of such exhibitions—for improvement in *Homo*-culture and *Agri*-culture are inseparable. In other words, the culture and improvement of the Soil, and the Mental and Physical Man, are alike necessary to the highest prosperity and civilization.

But to the show of stock. H. T. Brooks, President of the Wyoming County Agricultural Society, exhibited a number of very fine Durhams, including several superior cows bred in Kentucky. Also a few fine Devons—steers and heifers. J. W. Dunham, President of the Society, made a creditable show of Durhams and their grades. Messrs. D. J. Sprague, J. S. Walker, Shumway, Wm. Ward, Carlisle, and others, severally exhibited fine animals—full bloods, grades and natives. The display of working oxen and steers was very good; those of Ward and Walker were much admired.

The show of Sheep included some superior specimens of both coarse and fine wooled breeds. Col. Hannum's Leicesters, and a lot of South-Downs, were very good representative animals. J. S. Walker's Atwood Merinos were superior in fleece and carcass. The Spanish Merinos shown by Messrs. Cameron and Gilmore, were also noteworthy.

STEUBEN COUNTY FAIR.

Ens. Rural:—The Second Annual Fair of the Steuben Co. Agricultural Union, was held at Bath, Oct. 11 and 12,—and well attended.—Owing to the unprecedented drouth of last summer, the exhibition was not so great an improvement upon that of last year as was then anticipated, but was nevertheless creditable. The Society have leased grounds for a term of years, and by means of generous donations from the citizens of Bath, have put thereon permanent fence and fixtures. The receipts from memberships and admission fees, amount to little short of $1,000, which, with the fund from the State, will enable the Society to make decided improvements upon the grounds, and leave a handsome fund for another year.

Mr. Allen, of Buffalo, gave a sensible address at the Court House on the evening of the 11th, to a crowded auditory, and was followed by A. B. Dickinson, in practical remarks upon agriculture. The exercises of the evening, as indeed of the entire show, were enlivened by a band of music from your city—a gratuitous offering of the public-spirited citizens of Bath to the Society. The performances of the band elicited flattering encomiums from many lovers of music.

Besides the usual cash premiums, the last Patent Office Report was freely dealt out by the Awarding Committees, one hundred copies thereof having been promised to the Society by Hon. George Hastings, the present Representative from this Congressional District.

The weather was unpropitious the afternoon of the second day, and the show was injuriously affected by the season, else all would have been satisfied with this second effort of our youthful organization. R.

Hand-rearing Calves.—At a recent meeting of the New York Farmers' Club, A. A. Moss, of South Norwalk, Conn., exhibited a simple plan for rearing calves. A gutta percha teat is affixed to a tin can, filled with skim milk, hay tea, or other food, which, being hung up in the calf pen, is taken as naturally as though it was the teat of the cow. With the use of this little machine—costing perhaps a couple of dollars—the 2,000 calves weekly sacrificed in this city before they acquire age enough to make food fit for human stomachs, can be saved, without loss of milk to those engaged in dairy business, and thus save a vast number of animals for beeves, now wholly lost to the world.

When farm stock is kept in well littered stalls, and every other judicious means taken to manufacture manure, one head will produce sufficient to keep an acre of ground in the highest state of fertility.

DISEASES IN THE EYE OF HORSES.

We take the following extracts from Dr. Dadd's *Modern Horse Doctor*. Though written more especially in reference to preventing diseases of the eye, they are equally applicable to all other ills that horse-flesh is heir to, for it is quite obvious that a horse or any other animal in a perfectly healthy condition is more likely to escape disease of any kind than one in a depressed state:

As prevention is much cheaper than cure, it must be obvious that it is of great importance to practice that system of management, with respect to feeding, exercise, cleanliness, and ventilation, which is most likely to prevent *ophthalmia*. When horses are put to regular daily work, their health will be best maintained by feeding them regularly three times a day with mixed diet, composed of bruised oats, shorts, meal, cracked corn, and cut hay.—These should be allowed in sufficient quantity and no more; for too much food must impair the digestive organs and derange the general health.

As regards *exercise*, it is indispensable. No man or horse can ever enjoy good health unless habituated to daily exercise; it tends towards their health and strength, assists and promotes a free circulation of the blood, determines morbific matter to the various outlets, develops the muscular powers, creates a natural appetite, *improves the wind*, and finally invigorates the whole system. The exhaustion produced by want of rest is equally dangerous; such horses, at certain seasons of the year, are always among the first victims, and when attacked their recovery is generally protracted.

As regards *cleanliness*, the brush and curry-comb should be used morning and evening; the latter, however, must be dispensed with when the horse is laboring under any form of cutaneous disease, at least while in its acute stage. Good *rubbing* promotes the circulation of blood through the capillary vessels, acts as a counter irritant, and relieves congestions.—Many of the diseases to which horses are subject, more particularly those of the alimentary canal, have their origin in a filthy skin. We are decidedly opposed to the use of the curry-comb with a view of divesting the horse's legs of mud and filth, for the parts below the *knee* and *hock* are destitute of fleshy fibre; from which circumstance the periosteum, enveloping the bone, is more exposed to violence from the teeth and edges of the curry-comb.—If a horse comes from his work covered with mud, the better plan would be to detach it, when dry, with a wisp of straw, after which a good stiff brush will *put on the polish*.

The admission of light into stables, being a subject next in importance to the former, deserves a passing notice. Nothing is so detrimental to the eyes as sudden transitions from comparative darkness to a glaring light; and probably many of our readers have, at some time, experienced the very unpleasant sensation of mingled pain and giddiness, which is not readily dismissed, after emerging from a dark room, and suddenly coming in contact with the glaring rays of the sun; and if they have they know how to sympathize with a poor horse.

NATIONAL CATTLE SHOW.

The U. S. Agricultural Society will hold a National Show of Cattle, open to general competition, without sectional limit, on the 24th, 26th, and 27th day of this month, at Springfield, Ohio. *Six thousand dollars* will be awarded in Premiums, several of which are larger than have ever been offered by any Agricultural Society, either in this or other countries.

Extensive preparations have been made for the accommodation of strangers. Extra trains will convey passengers to the neighboring cities and towns, who cannot obtain lodgings at Springfield. Private houses will be open for the reception of guests.

The principal railroads will take stock *free of charge*, and passengers at *half price*. On stock the freight must be paid on the passage out, and on the certificate of the Secretary of the Show, that the animals have been exhibited and have not been sold or exchanged, the money paid for transportation will be refunded, and they returned free to the point from which they started.

Visitors should be careful to obtain excursion tickets on the several railroads, and at Springfield to have them stamped by the Secretary of the Show, in order to make them available on their return at half price.

On Thursday, October 26th, at 2 o'clock, P. M., a grand Agricultural Banquet will be held on the grounds. It is anticipated that this will be one of the most interesting and imposing parts of the exhibition, and in which ladies, as well as gentlemen, will participate. The exhibition of cattle will probably be the largest ever held in America, if not in the world, and the concourse of people immense.

New Food for Sheep.—While I was at Geneva, I observed every one collecting carefully the fruit of the horse-chestnut, and on inquiry I learned that the butchers and holders of grazing-stock bought it readily at a certain price per bushel. I inquired of my butcher, and he told me it was given to those sheep in particular that were fattening. The horse-chestnuts were well crushed; something in the way, so I understood, that apples are, previous to cider being made. They are crushed or cut up in a machine kept solely in Switzerland for that purpose; then about two pounds' weight is given to each sheep morning and evening.—It must be portioned out to the sheep, as too much would disagree with them, being of a very heating nature. The butcher told me that it gave an excellent rich flavor to the meat. The Geneva mutton is noted for being as highly flavored as any in England or Wales. —*Ag. Gazette.*

Talk of starving! The assessors' rolls in Indiana show that there are as the present season 588,377 more hogs in that State than there were during the same season last year.

PREMIUMS AWARDED

At the N. Y. State Agricultural Society's Fair, at New York City, October 6, 1854.

FLOWERS.

John Howell, New York city, silver medal; J W Wood, Worthington Heights, silver medal.

Hothouse—H Buell, Astoria, L. I., $6; John Howell, S; J W Wood, 3; James Weir, Barry Ridge, L. I., silver medal.

Roses—H Buell, N Y city, 5; M Donald, 3; M Donald, 2; James Weir, 2.

Phlox—D Bell, 5.

Petunias—John Illingwell, Albany, 5.

German Asters—Michael McGuines, Staten Island, silver medal.

Best Cut Flowers—S Moran, Mott-Haven, Westchester co, silver medal; 2d, Mrs William Newcombe, Pittstown, Rensselaer co, 2.

Dahlias—Greatest and Best Varieties—Geo W Thatcher, Sunnyside Place, West co, 5; 2d, James Weir, 3.

Best Twelve distinct Varieties with Names, Jas Weir, 3.

Best Twelve Varieties Roses with Names, James Weir, silver medal.

Verbenas—Greatest Number and Varieties—Mrs Jas T Van Namee, 5; 2d, Mrs William Newcombe, Pittstown, Rensselaer co, 3.

Best Twelve distinct Varieties with Names—Jas Weir, 3; 2d, Mrs James T Van Namee, 2.

Best Six distinct Varieties with Names—Mrs James T Van Namee, 3; 2d, Samuel Moon, Mott-Haven, Westchester co, 1.

Phloxes—Greatest Number and Varieties—Mrs William Newcombe, 4

German Asters—Best Collection—Mrs William Newcombe, 3; 2d, Mrs Jas T Van Namee, 2.

Best Collection Pansies—Best Display—Mrs William Newcombe, 3; 2d, Mrs Jas T Van Namee, 2.

Best Collection of House Plants in Pots—A P Cummings, Williamsbridge, silver cup; Samuel Moon, Mott-Haven, Westchester co, 5.

Floral Design or Ornament—H A Graef, Bronklyn, 5; Mrs Jas T Van Namee, 3.

Bouquets—H S Parke, Brooklyn, 5; Wm Reid, N Y city, 3; James Weir, 2; W and S Parke, Brooklyn, 1.

Pyramids—Samuel Moon, Mott-Haven, silver medal.

Green-House Plants—Thos Hogg & Son, Yorkville, diploma; Ellwanger & Barry, Rochester, diploma.

FRUITS.

Apples—Greatest number and best specimens—J W Bailey, Plattsburgh, N Y, silver cup, value $15.

Best 24 varieties—A Frost & Co, Rochester, 10; 2d, Norman Crittenden, Ithaca, Tompkins co, 5.

Best 12 varieties—John H Coy, Ithaca, Tompkins co, 5.

Pears—Greatest number of good varieties and best specimens—Ellwanger & Barry, silver cup, value 15.

Best 20 varieties and best specimens—Ellwanger & Barry, silver plate, value 10; 2d best, A Frost & Co, 5.

Best 12 varieties—Ellwanger & Barry, 8.

Best 6 varieties—Ellwanger & Barry, 6; 2d, Dr Norman Crittenden, Ithaca, 3.

Plums—Greatest number of varieties and best grown specimens—Ellwanger & Barry, 2.

Prunes—Best variety, 12 specimens—John R Woolsey, New York, 2.

Quince—H Frost, Rochester, 3.

Grapes—Greatest number of native varieties and best specimens—R T Underhill, Cedar Point, N Y, 5; 2d greatest do, R T Underhill, 3.

Best one variety—R T Underhill, 2

Greatest number and best specimens of Foreign Grapes, grown under glass—S W Ludlow, Yonkers, Westchester co, 10.

Best one variety—S W Ludlow, 3.

Watermelons—Greatest number and best specimens—John Hoge, Cooper's Island, Duchess co, 2.

Peaches—Greatest number and best-grown specimens—H G Hickenson, Lyons, N Y, plate value 5; 2d, E Sherman, Crawford, Orange co, 3.

Best one variety, 12 specimens—H G Hickenson, 2.

Plums—Greatest number of varieties and best-grown specimens—Elisha Dorr, plate, value 5.

Best six varieties—Elisha Dorr, plate, value 3.

Best one variety—Elisha Dorr, 2.

Grapes—Greatest number of native varieties and best grown specimens—Theodore Fowler, Fishkill, Duchess co, 5; 2d, Isaac Merrill; Hartsville, Duchess co, 3.

Best one variety—Isaac Merrill, Hartsville, 2.

FOREIGN FRUIT.

Pears—out of the State.—For the greatest number of varieties and best specimens of Pears correctly named—Hovey & Co, Boston, silver cup, 15.

For the best twenty varieties of Pears, best specimens, correctly named—Hovey & Co, silver plate, 10.

Grapes—Best variety of good Native Grapes—Hovey & Co, 2.

Best specimens and greatest number of varieties Foreign Grapes grown under glass—James Potter, Princeton, N J, 10.

Best one variety of "Black Hamburg" grown under glass—James Potter, 3.

Apples—Best specimens and greatest variety of Apples—L S Pennington, Whiteside, Illinois, silver cup, value 15.

For the best twenty varieties of Apples, best grown and correctly named—L S Pennington, 10.

DAIRY.

Butter—A Rider, Litchfield, Herkimer co, N Y, $15; Thomas Fagan, Eden, Erie co, N Y, 10; E Sherman, Crawford, Orange co, 5.

Butter made by Girls under 21 years of age—1st Prem.—Emily J Clark, Pittstown, Rensselaer co, silver cup; 2d, Susannah Iler, Greenwich, Washington co, pair butter knives; 3d, Miss Otley, Oaks Corners, Ontario co, set of tea spoons; 4th, Miss Mary J Morrison, Montgomery, Orange co, silver pencil.

Cheese—D & S Bonfoy, Winfield, Herkimer co, 20; Wm C Young, Litchfield, Herkimer co, 15; A Rider, 10; S Sarsh, Hamburgh, Herkimer co, 25; D & S Bonfoy, 15; J Rice, Salisbury, Herkimer co, 10; J Hurst, Little Falls, Herkimer co, 5; A Corn, Russia, Herkimer co, Jr, 1mr

J O Williams, Rome, Oneida co, N Y, had on exhibition two large Cheeses weighing 600 lbs each—especially commended and worthy a discretionary premium.

HONEY.

Henry Eddy, North Bridgewater, Mass, 8; William Curtis, Blooming Grove, Orange co, 3; M Quinby, Palatine Bridge, N Y, 1mr.

No Sugar exhibited.

GRAIN AND SEEDS.

(Not less than a barrel.)—Best sample white winter Wheat—William P Otley, Oaks Corners, Ontario co, 5.

Rye—Solomon D Crispell, Hurley, Ulster co, 5; 2d, E Sherman, Crawford, Orange co, 3.

Oats—William P Otley, 5; 2d, Dr P Crispell, Hurley, Ulster co, 3.

Barley—O Howland, Owasco, Cayuga co, 5; 2d, O Howland, 3.

Indian Corn—W P Otley, 5; 2d, Solomon D Crispell, 3.

VEGETABLES.

Turnips—A Fitzgerald, N Y, 3; H Greeley, Chappaqua, Westchester co, 2.

Carrots—William Daley, 132d st, N Y, 3; Francis Hall, Long Island, 2.

Beets—Wm Daley, 3; Morris & Daly, West Farms, Westchester co, 2.

Parsnips—William Daley, 3.

Onions—Z M Saunders, Albany, 3; James Hallock, Whitestown, Oneida co, 2.

Cabbage—James Hallock, 3; Morris & Daly, 2.

Tomatoes—Morris & Daly, 3; James Pell, 1, 1, 2.

Egg Plant—Robert R Morris, Westchester, N Y, 3; E Sherman, 2.

Sweet Potatoes—E Sherman, 3.

Lima Beans—James Hallock, 3; F Buell, 1, 1, 2.

Lettuce—J Corkey, Seventy-ninth st, New York, 3.

Parsley—J Corkey, 3; Z M Saunders, Albany, 2.

Garden Squashes—Jas Hallock, 3; J Corkey, 2.

Field Pumpkin—John Butterfield, Utica, N Y, 3.

Twelve 2d best ears of White Seed Corn—H Greeley, 2.

Potatoes—Ja. Hallock, Whitestown, Oneida co, N Y, 3.

Best and greatest variety of Vegetables raised by exhibitor—John C Heckman, N Y, 10.

Special Premiums Recommended.—Savoy Cabbage—F Brill, Long Island, 2.

Million Squash—C F Gray, Massachusetts, 2.

Six Cheese Pumpkins—F Brill, Long Island, 3.

French Pumpkins—E Archer, N Y, 1.

Salsify—Wm H Mitchell, Dutchess co, 3; A Fitzgerald, New York, 2.

Peppers—C E Thrasher, New Jersey, 3.

Seedling Potatoes, "Nonpareil"—H D Fenks, Whaleley, Mass, 3.

30 varieties Potatoes—H Morrison, Montgomery co, 3.

5 fine specimens Potatoes—J Nye, Vermont, 2.

25 varieties Potatoes—D Grinton, Westchester co, 2.

Wood's Seedling Potatoes—W W Averell, Connecticut, 1.

1 fine variety Potatoes—H A Barklay, Massachusetts, 1.

Green Corn, Peas, Tomatoes, String Beans, preserved in tin cans—E D Edget, Onondaga co, diploma.

FLOUR.

Best barrel Flour—Becker & Brothers, Croton Mills, 10.

PLOWING MATCH.

First premium, Newell French, Detroit, Mich, 10; 2d, G E Sheldon, Seneca, Cayuga co, N Y, 8; 3d, D H Wertell, Lyons, Wayne co, 6; 4th, Morris & Purdy, Morrisiana, Westchester co, 4; 5th, William Daly, Morrisania, 2; 6th, John Rae, Morrisania, trans.

SPADING MATCH.

Best spading, John Dare, silver cup, value $10; 2d, Daniel Norton, Morrisania, silver cup, value 5; 3d, Richard Shelverton, silver medal; 4th, John White, Morrisania, Gardener's Companion and Manual; 5th, Joseph Fitzadler, trans; 6th, Wm McCoy, diploma.

FARM IMPLEMENTS.

Best Harrow, Wm Anderson, Jacksonville, Tompkins co, 5; 2d, Mayhew & Co, N Y city, 3.

Best Corn Cultivator, J & S Peckham, Utica, N Y, 5; 2d, James Cramer, Schuylerville, 3.

Best Fanning Mill, (Grant's patent,) Mayhew & Co, New York city, 5; 2d, H J Ledlow, Springville, Rockland co, 3.

Best Cornstalk Cutter, Reuben Daniels, Woodstock, Ct, 5; 2d, J C Rich, Penfield, Monroe co, 3.

Best Hay and Straw Cutter, H C Cunningham, Fulton, Oswego co, 5; 2d, Spiral Cylinder Machine, Hayden & Co, New York city, 3.

Best Corn and Cob Crusher, by Horse-power—G B Hotchkiss, Auburn, N Y, 5.

Best Clover Machine, Mayhew & Co, New York, 5.

Best Horse-Cart for Farm—Kipp & Sam, Newburgh, 5.

Best Horse-Rake—Langell & Drilling, N Y city, 5; 2d, R L Allen, N Y city, 2.

Best Ox-Yoke—Dering & Dickerson, Albany, 2; 2d, R L Allen, 1.

Best Churn—John Mayhew & Co, 5; 2d, R L Allen, 2.

Best Cheese Press—H L Allen & Co, 5; 2d, John Mayhew & Co, 2.

Best Grain Cradle—John Mayhew & Co, 3; 2d, G G Kilsey, 2.

Best six Hay Forks—Shebler & Lawson, Philadelphia, 3.

Best six Grass Scythes—Silas Harris, Pine Plains, N Y, 3.

Best six Cradle Scythes—Silas Harris, 3.

Best six Manure Forks—Harvey Partridge, 3; 2d, Shebler & Lawson.

Best Potato Digger—Henry Partridge, 5.

Best dozen Wire Brooms—S Dennis & Co, N Y city, 3.

Best Hive and Bees—E W Phelps, 5; 2d, Asa Johnson, 3.

Best Sausage Cutter—John Mayhew & Co, 3; 2d best Sausage Stuffer—John Mayhew & Co, 3.

Best Manure Fork and two Horse-Shoes—S B Dodge, 2.

Best portable Sawmill, for wind, horses and farm use, E W Bridger & Co, Fly Creek, Otsego co, 10.

Best Corn Sheller, hand power, Dering & Dickson, 6; 2d, Mayhew & Co, 4.

Best Vegetable Cutter, Mayhew & Co, 6; 2d, Geo Campbell, N Y city, 4.

Best portable Grist Mill, R L Allen, 3.

Best Farm or Road Scraper, R L Allen, 5; 2d, Mayhew & Co, 3.

Best dog-power Churning Machine, Mayhew & Co, 5.

Best Pump for farm use, Cowing & Co, Seneca Falls, 5.

Best horse-hoe for cleaning drilled grain crops, Mayhew & Co, N Y city, 20.

Best and most numerous collection of agricultural implements, R L Allen, 25; 2d, Mayhew & Co, 15.

Best and most numerous collection of agricultural implements, manufactured in the State of New York, by or under the supervision of the exhibitor, materials, workmanship, utility, durability and prices to be considered in both cases, R L Allen, 25; 2d, Mayhew & Co, 15.

THE FARMER'S HOMESTEAD.

If now, finally, we go back with him from all these exterior liabilities to his own premises again, we shall need, by this time, to memorialize the farmer of what is required of him in his house. If the school has disciplined his thinking faculty and refined his taste; if the town meeting has awakened in him the exalting sense of citizenship; if the church has lifted his heart into communion with the Father of all families, and inspired his conscience by the prophecy of life eternal, he will scarcely be content to live a driveling dullard life at home, to ply the selfish tyrant in the little political economy of kitchen and parlor, or to be worse than an infidel by providing not for his own.—By derivation, the significance of your common title husband-man, holds you to do something. Husband-men, I suppose, are not bachelors. Now, as Nature has done her part towards furnishing a husband-man, by making you a man, she seems to presume you finish the business by making yourself a husband.—Husband, is house-band, or organizer of household life. Organize it by not only the sterling, homebred, domestic moralities, but by the binding charm of those thousand amenities that distinguish a cultured home from the barbarian's hut.

The delicate angel of the beautiful knocks at your door and begs admission, as well as the strong angel of the useful. Is there the fine eloquence of order; is there the disposing touch of taste; is there the simple and just coloring hand of nature round all your door stones, in all your front lawns, on the walls and tables, and furnishing of your dwellings?—How many hours of a spring would it take to embower your windows with all that is graceful in green foliage, and winning in floral splendor? Plant trees before you purchase Venetian blinds and painted pickets. You will carry a tenderer, and therefore a manlier heart in your breast all day, if you pass out of a genial circle through the fragrance of lillies, and roses, and honey suckles. See that the sons and daughters are interlaced by hands more spiritual than gregarious bipeds. Let the harmonies of evening music weave their souls into some gentle and lofty sympathies, gaining the boys from their ruder pleasures and doubtful companionships by the pre-occupying satisfactions of a cheerful, courteous, and hospitable fireside. Starve your palate, if need ever were such denial, to stock your library. Raise the tone of farm-house table-talk if you can, and let the ladies help, where stale gossip, common places of the day's work, and scrubbing tattle. Hang the proceeds of your premiums at cattle-shows on the wall, not in bottle stores, or flaunted millinery, but in the shadings of some pleasing picture that reflects a glorious idea or heroic sacrifice. Household life is not to unfold into grace and moral loveliness by accident, any more than the wealth of your garden or orchard. It must be cultivated.—And I take it, Christianity speaks of that higher kind of economy as much as of butcher's meat and breadstuffs, when it pronounces him that provideth not for his own, worse than an infidel.—*Rev. F. Huntington.*

A Hint to Farmers.—A late writer says that "the less land a farmer has the more corn he will raise." This is so. Our friend S. once owned a farm of 300 acres, while his capital was so small that he could only half manure it. The effect was that he could scarcely pay expenses. The money he expended on fences should have been expended on guano; while the wear and tear of plow and harness, was nearly equal to the par value of his potato crop. Some three years ago S. endorsed for a friend. The friend forgot the day it was to fall due. S. had to take it up for him. To do this, he mortgaged his farm. The mortgage was foreclosed, and one half his farm struck off to the highest bidder. He thought he was ruined. No such thing. The manure, labor and horse-flesh, which he formerly scattered over three hundred acres, were spread over one hundred acres, and what was the result? We will inform the reader. He now clears $2,000 a year, which clearing is effected with one-third the labor, swearing and chuckleheads, which he formerly made use of to keep himself poor and ill-natured. We conclude with the same text we set out with—"the less land a farmer owns, the more corn he will grow."—*Anon.*

When an implement is no longer wanted for the season, lay it carefully aside.

Orchard and Garden.

DIFFERENT VARIETIES OF MELONS.

The writer received from various sources a number of different samples of melon seeds, and from various parts of the Union. Most of the senders being subscribers to the RURAL, I propose to speak here of my success with them. My melon vines were all planted on ground which was of but moderate fertility—the same as was planted to corn. In fact my melons received no other attention than did my corn crop. I kept them free from weeds, and in order to keep the varieties from mixing, each one was planted by itself and at some distance from any other. The drouth, too, affected them severely just as they were nearly grown, ripening them prematurely, dwarfing them in size and injuring them perceptibly in their flavor.

First among them stands the *White Mexican*, which fully maintained its character as shown last season. This watermelon, so far as the writer's experience goes, stands pre-eminent as a luscious, tender, juicy and sweet melon, the rind very thin and tender.

Next to it I found the *South American*, the seed of which I received from Mr. WM. S. DENNY, Royal Oak, Talbot Co., Md. Mr. DENNY gave me the history, &c., of it as follows:—"This water melon was originally bro't from S. America, (by an old sea Captain, a great uncle of mine,) before I was born, and, I believe, has been kept genuine to this day. I can recollect that when a boy my father would not plant nor suffer to be planted any other kind on his farm for fear of mixture, and I am sure these seed are as pure as when first received from S. A., except what deterioration might come from a constant cultivation in the same soil for 50 years. They grow tolerably long, of medium size, red-fleshed, very juicy and sweet; pure white seeds; generally of a dark green rind, and are decidedly the best melon we have in this neighborhood." Mr. DENNY's encomium of them is well deserved, for they are a superior melon, and all my neighbors who tasted them, were lavish of their praise. For a red-fleshed melon I believe they have no superior."

I received from Mr. HIRAM BRADFORD, of Brownsville, Tenn., seeds of a variety which he termed his "*favorite melon*." These gave promise of being very fine. The vines were very prolific with fine looking, long, oval-shaped melons, but just as they were ready to ripen they were visited by some night prowlers and all destroyed. From the fragments scattered about they gave token of being nearly or quite equal the *South American*. They were red-fleshed, and the seeds received, much resembled in shape and color those of the *White Mexican*.

The *Red Mexican* proves very good, somewhat variable in quality and in color of seeds. Not equal to the white variety but better than many of the common varieties. Melon seeds from JAS. R. MARTIN, of Tenn., also proved to be very excellent melons, somewhat variable in quality, color of flesh and seeds.

Mammoth Melon, from J. MCKEE, of Bristol, Vt., a very large, round, dark green melon, rather thick tough rind, but red-fleshed and of good quality. From this sample I had the largest melon. Mr. MCKEE, in a recent letter, states he has this season raised them weighing 30 lbs., which is double the weight of mine and argues a much richer soil and better attention than I was able to bestow upon them.

The *Georgia Melon*, received from Lexington, Ga., also proved, as recommended, a very fine variety. Somewhat variable as to color of seed and rind; color of rind light grey to a striped or mottled green; rind thin, melon long and red-fleshed, juicy, tender and sweet. So far as my experience goes, melons from the South and South and South-West are superior in quality of pulp and also in vigor of vine and leaf.

Winter Melon from G. W. ROUEL of St. Josephs, O., who claimed it to be superior to other melons only in one point, that of keeping in a dry cool place, till mid-winter, and allowing the lover of melons a treat of them on Christmas or New Year's day. The sample I had proved to be of inferior quality; of their keeping I cannot speak, as I have no means of testing it.

Apple Melon, from the same person—is a small, round, very early melon, said to be sweet and juicy and very prolific. I had but one vine of it, and that had a hard struggle for life. The three or four melons that set upon it were also destroyed by the midnight prowlers. I succeeded in gathering up a few seeds from the fragments for another trial, as I also did of Mr. BRADFORD'S melon. The same scamps also took to themselves the best of my *White Mexican* melons.

The *Ice Cream* and *Mountain Sweet*, are good melons, generally known.

Virginia Citron or *Cantelope*, is a choice melon, I have had for two years from a youthful correspondent in Va. It is small, nearly round, slightly furrowed, of a yellowish green rind when ripe, pale greenish flesh and very sweet and juicy. Altogether the best melon of the musk or cantelope variety within my knowledge. It is a prolific variety, and in this respect more than makes up for smallness.

Jenny Lind Citron, received from A. W TEST, of Camden N. J., who remarked in his letter, "It is a new variety of citron which has made its appearance in this vicinity within the last year or two. In shape it resembles a ball much flattened and indented at the stem end. Skin rough and of a green color, has deep furrows down its sides. Pulp of a yellowish color and not excellent flavor. In size not much larger than a man's fist." The drouth affected these before any other of my melons and in fact withered up the vines in a great measure before the fruit had attained its proper maturity, hence I could not form so definite an opinion of their merits. Under more favorable conditions I think they would nearly or quite equal the Va. variety.

With the *California, Melon* from friend I. W. BRIGGS, I had but poor success, maturing only one ill-favored specimen from which I saved a few seeds for future trial that I hope will be more satisfactory.

The muskmelon seeds from Paris, France, received by the kindness of Dr. HOLMES of the *Maine Farmer*, came so late to hand, I planted but a hill or two, and had, as I expected, but poor success. One specimen would, I think, have matured had it not been accidentally severed from the vine. Dr. HOLMES remarks of it; "I received the seed from my friend GEO. B. BARNORS, Esq., of this State (Me.) who visited England and France in 1851, and found the melon in the markets of Paris. The first year he only succeeded in raising one small unripe fruit, the seed of which, however, vegetated the next season, and produced melons weighing 10 to 12 lbs. It looks like a squash and is invariably pronounced such at first sight." Having a few seeds left I hope for better success another season.

The *Squash Melon* from a correspondent in Ohio proved to be a common muskmelon, and quite common at that. T. E. W.

A MODEL FRUIT AND FLOWER GARDEN, is that of WM. ANTIS, Esq., of Canandaigua. A visit to it on the last day of the Ontario Co. Fair, is among the pleasantest reminiscences of several weeks recreation and rustication in pursuit of health and strength. It is well stocked with both Fruits and Flowers, and exhibits good taste and superior cultivation. For the ground occupied—about an acre—the yield of choice strawberries, grapes, peaches, pears, &c., and display of flowers, is extraordinary, and clearly demonstrates that some things can be done *better* than others; or rather, that some *persons* do things in a manner most creditable and commendable. We have not seen or tasted finer grapes,—especially Catawbas,—this season; and the fruit exhibited at the Fair by Mrs. ANTIS, deserved, whether awarded or not, special commendation.

—By the way, Canandaigua is somewhat celebrated for its beautiful residences and their surroundings, including fruit and flower gardens worthy of imitation in Rochester and other towns, where a taste for rendering small plots of this mundane sphere beautiful and fruitful is supposed to abound. The example we have mentioned is a prominent one, and certainly entitled to this brief mention.

FIG TREES.

WHEN our citizens purchase figs in our market, they have but little conception of the size of the trees that have yielded the delicious fruit they are now tasting.

We have written this communication beneath the magnificent fig trees in the fruit garden of E. L. Beard, Esq., of San Jose. We have just measured two of a group of ten fig trees, the least of which measures 2½ feet in circumference. The trees of the group are forty feet high, and the largest measures 5½ feet in circumference; the limbs eleven feet from the ground measure 2 feet two inches in girth; limbs four feet from the ground measure 3 and 3½ feet in circumference. The leaves upon the trees measure 18 inches across. This may seem incredible, yet these are facts. The fruit is just now ripening, and one specimen before us measures eight inches in circumference. Such fruit can be easily raised, and will be by those who make California their home. The fruit gardens of Mr. Beard now present a cheerful sight. Pear trees are bending beneath the weight of their fruit, which hangs in immense *ropes* and clusters, causing the entire trees to assume the appearance of weeping trees. There are no grounds in the State that present a finer appearance than those we name; young orchards of acres, numbering thousands and tens of thousands of trees, are coming into bearing, giving promise of future abundance. Surely, such effort on the part of our cultivator deserves a corresponding reward.—*Cal. Farmer.*

THE GARDEN.—As an experiment, trench a portion of the garden, even if it be but a small piece, 18 inches deep, and note the effect on the crops next year, other things being equal. Trim out and tie up raspberries; dress strawberries; plant out hardy bulbs; and do all that may be done in the garden so as to save time in the spring.

THE BEST SOIL FOR FRUIT TREES.

AFTER almost a half century of experience in raising fruit, we are decidedly of opinion, as a general rule, that the best soil on which to raise fruit, is that just cleared of a forest. The surface should be rolling or descending, and moderately dry and rich. Such ground needs little or no preparation; the roots of the forest trees as they decay, keep it loose and mellow, and afford the exact food necessary for a rapid and healthy growth of the fruit trees; and the soil abounds plentifully in those elements which are requisite to form the most perfect fruit.—Another consideration, and a very important one, is, that fruit trees grown on recently-cleared forest land, are much less diseased than those grown on old land, and the fruit is not near so liable to be attacked by insects.

Any one going from an old settled country to a new one, will not fail to observe the remarkable difference between the trees and fruit of the one and the other. How much thrifitier they are in the latter than in the former, and how much larger, fairer, and more perfect the fruit.

We would advise those contemplating setting out new orchards, if they have no wood land to clear for this purpose, to set apart as much as they desire for fruit, and let it grow up with young forest or other trees as rapidly as possible. Even a few years' growth will answer a good purpose, provided they are cut down and allowed to lie on the land; and when dry, burnt off where they are, and the ashes permitted to remain. This is undoubtedly one of the best preparations and *manures*—if we may so use the term—that can be obtained.

In growing peaches, &c., we have found—other things being equal—that new orchards usually did best planted on old orchard ground, the trees set as near as possible to the decaying stumps. Previous to planting, however, the soil should be broken up at least two feet deep, if possible, and ashes and such other fertilizers added as are necessary to insure a good growth.

Granite soils are among the best for fruit, as this rock abounds in feldspar and mica, both of which contain potash—feldspar more than mica. As these rocks disintegrate and enter into the composition of the soil, they supply one of the most necessary elements for the formation of good trees and fruit. We will also add that some of the best orchards which we have seen, were on alluvial (loamy) soils, lying upon limestone rocks which came up near the surface.—*American Agriculturist.*

SEEDLING PEACHES.

WE consider it to be an object for all engaged in the cultivation of peaches to regard more favorably the importance of raising seedling peach trees, and not depend too much upon raising foreign varieties by budding.—September is the most favorable month for selecting pits of the most choice kinds to grow seedlings from. Procure peaches of the largest and most desirable sorts, ripening from the middle of August to the last of September and a few October peaches of good quality. When the pulp is removed place the pits in separate parcels, according to variety, in a cool and rather moist place. We prefer white peaches, because in a cold, wet season the yellow varieties are more acid. If possible save no pits from a tree that grew in a garden or orchard where inferior kinds were grown; if this cannot be done, get them from trees as far distant as possible.

At any time before the ground freezes up, select a safe place—put the pits in the earth and cover them with about three inches of soil, and permit them to remain undisturbed until early in the spring. Having prepared the ground, mark it off into drills with a plow or hoe. Crack such of the pits as are not opened by the action of the frost; plant them about ten inches apart in the drills, and cover about two inches. When sufficiently large prune all the branches off that are below *one foot* from the ground. Cut none from the tree above a foot,—in after culture trim according to the shortening-in mode of pruning. Transplant at one year old.

If proper care is observed in selecting and preparing the pits, there will hardly be a failure in having peaches as good, probably some superior, to the parent trees, the seedlings often partaking of the qualities of the two kinds growing near each other.—*Mich. Farmer.*

COLD VINERY.

ONE of the editors of the Am. *Agriculturist* in noticing the garden of J. H. Peck, of Burlington, Vt., says:

We saw in this garden a cold vinery, in which are matured every season the finest of the foreign grapes, and yet the structure was so cheap as to be within the reach of men of very moderate means. Most horticulturists are deterred from the cultivation of these grapes, by the idea that they are necessarily very expensive. But artificial heat is not at all necessary, and a building that one may extemporise with a saw and jack-knife, will produce as fine Hamburgs as a vinery costing from one to five thousand dollars. The great essentials are a good border and glass to protect them from the changes of our climate. Grapes that took the premium at Hartford last fall, we were informed, were raised in an old shanty vinery, not costing thirty dollars. We had the curiosity to visit it, and found the report no exaggeration. We have also seen this season, in the garden of a gentleman of note, a vinery of his own construction, cheaper still, where the Hamburgs seemed to be entirely at their ease.

THE object that attracted the most attention at the late Horticultural exhibition in Boston was a miniature peach tree, about two feet in height, growing in a pot, and laden with the most delicious fruit.

A FRENCH gardener has discovered that by painting his hot-houses with gas tar all the insects, so destructive to plants and fruit, die.

Mechanic Arts, &c.

A NEW KIND OF BRICK.

WE have been lately shown an entirely new material, says the Telegraph, for the construction of buildings. It is a preparation of sand and lime put into moulds, and operated upon with a most powerful press. The specimens we saw had about three times the superficial area of a common brick, though, of course, their size would depend upon the pleasure of the maker. They are made with an open space in the centre occupying one-half the length and about one-third the breadth of the brick. Those we saw were a handsome grey color, as smooth as dressed stone could be, and apparently as solid as granite. Their real solidity was about equal to a good burnt brick, though they had been made but about three weeks, and lime and exposure is expected to harden them continually. They can be furnished as cheaply as brick, and unless some difficulty is developed with regard to them not now apparent, it seems to us they must come into active demand for building purposes.—They would certainly appear as beautiful as the finest stone, and making, as they do, a hollow wall, with a smooth interior surface, they can be papered against, or painted or whitewashed, without the necessity of lathing or plastering.—*Kenosha (Wis.) Telegraph.*

HOW TO BURN COAL.—*Grahams Magazine* has an article on coal buying and burning, from which we select the following:—"The great mistake of all is to put on too much coal, as if it were wood—the greater the quantity, the greater the heat. If too much coal is applied, the combustion is necessarily imperfect, because the fire is 'choked up,' the draught destroyed, and the elements of the coal slowly escaping from it, pass off to the chimney unconsumed, or disseminated in gases through the room. Whereas, if the strata of coal be but moderate, a red flame will play around the interior of the stove, by which entire combustion and a healthy heat are secured. One ton of coal, therefore, by thorough combustion, will often serve more heat, and a healthier atmosphere, than two tons secured in the ordinary way; and this is a fact which can easily be demonstrated." It will be very important, this winter especially, to have attention paid to this rule.

FRENCH SCIENTIFIC EXPERIMENTS.—A curious experiment was made recently in the basin of a fountain of the Palais Royal, Paris. A glass globe, containing a certain liquid, immediately spread over the surface of the water, and taking fire spontaneously, continued to burn with an intense flame for about a minute, throwing out a dense smoke; the basin and the appearance of being all on fire. Three gentlemen, well known to science in Paris, have invented this fluid, after long and patient study, with the design of making it available in the present war, in burning ships, and in protecting or attacking fortified places, where there may be a ditch. Thrown by means of a forcing pump into an entrenchment, or a ditch full of water, or on a branch, at the moment of assault, or in a naval combat, this liquid would cause the most terrible ravages.

HUB BORING MACHINE.—An improvement in a machine for boring hubs has been invented by L. A. Dole, of Salem, Ohio, in which the feeding part is so arranged and combined with a feed screw, gauge plate, and mandril, that the latter is made to adjust itself at the instant the shoulder of the hub has been cut the required depth, and then be turned with a screw to allow the cutter to square the shoulder. A self-centering lathe chuck is employed, which consists of a scroll screw, and sliding jaws, combined with a mandril passing through the center having a cutter secured on its extremity for boring out the hub, by which arrangement a perfectly hole is always bored out. Measures have been taken to secure a patent.—*Sci. American.*

WALKING ON RED-HOT IRON PLATES.—Prof. Pepper recently delivered a lecture in the Polytechnic Institute, London, before a large audience of mechanics, in which he remarked that the setting of the Thames on fire was no longer a joke, but a reality. By dashing a small bottle of sulphuric ether with a few particles of metal potassium into a flat cistern, a bright flame was produced, which illuminated the whole place. He laid down four plates of red hot iron on four bricks, and one of his attendants walked over them barefoot, without any injury. By wetting his fingers in ammonia, the Professor dipped them into a crucible of melted lead, and let the metal run off in the shape of bullets into a shallow cistern of water.

MONTMORENCIE SUSPENSION BRIDGE.—The foundation stone of the proposed suspension bridge, below Quebec, was laid on Monday last with much ceremony. The bridge is to span the river at the brink of the falls. The site chosen is one of the most magnificent in the country, commanding a view of the city of Quebec, the island of Orleans, and the river St. Lawrence for many miles. The platform of the bridge will be 316 feet—the distance between the north and south sides of the river is 300 feet; between the stone towers 327 feet; width of the carriage way 20 feet, with a footway of four feet on the side next the great fall. The estimated cost is $32,000.

A CORRESPONDENT of the London Builder says that houses should be painted in the Autumn. Woodwork painted in October, he says, looks better at the end of four years than it would, if painted in June, at the end of two.

A CORRESPONDENT of the *Builder* says that houses should be painted in the autumn; woodwork painted in October, he says, looks better at the end of four years than if painted in June, it would at the end of two.

THE KANSAS SEAL.

WE have just seen, says the *Easton Argus*, the seal of the Territory of Kansas, engraved by Robert Lovett, of Philadelphia, according to the design of Gov. Reeder. It consists of a shield with two supporters and surmounted by a scroll motto, and is emblematic of the life of the pioneer and the agriculturist. The lower compartment of the shield contains the buffalo and the hunter; the upper contains the implements of agriculture. The left hand supporter is a pioneer with his smock frock, leggings, rifle and tomahawk; while on the right is the Goddess Ceres with her sheaf, and at their feet, and between them, lie a fallen tree and axe.—The motto is a beautiful and striking allusion to the principle on which the Territory was organized, and consists of the "POPULI FOEDUS NATA," translated—*Born of the popular will.* The whole design is, we think, well devised highly, suggestive, and in excellent taste.

TIMELY RESUSCITATION.—A few days since, on Boatman Creek, two miles from Benton Station, on the Covington and Lexington Railroad, a number of men were engaged in digging a well. After making a blast in the bottom of the well, (about thirty feet deep) a man descended, and immediately fell, apparently lifeless. A second man went down to his assistance and also fell. A third descended, and he too was struck with the noxious gas.—To all appearance the three men were dead.—It happened that a man was going by with a cask of water on a sled, and, recollecting that he had heard it said that a stream of water poured into a well would dispel the noxious gas, he drove up and poured the water from the cask into the well. The effect was instantaneous. The men were immediately revived and taken out with every prospect of a complete recovery. The fact is important, and ought to be generally known.—*Cincinnati Gazette.*

BLIND SLAT MACHINE.—G. C. Sweet, and G. W. Noyes, of Norwich, Conn., have applied for a patent for an improved machine for cutting tenons on blind slats. There are two cutter heads on this machine, which are placed on a suitable frame and made to operate in such a manner, that they approach one another by means of a treadle and lever connected to them by rods, and act upon the slat presented to them, cutting off the surplus parts and leaving perfect tenons formed on the ends of the slat. The cutters rotate, and both ends of a single slat are trimmed at one operation, which is exceedingly simple and effective.—*Scientific American.*

COAL ON RAILROADS.—The item of wood on all railroads in this part of the country is becoming very onerous, and coal, or some other description of fuel, must soon be used as a substitute. The price now paid by the New-Haven road is $8 per cord, (for Southern pine,) which is the highest ever given. We understand that it is the intention of the company to run all the freight trains with Cumberland coal—the same that is used on nearly all the Pennsylvania and Maryland roads—at as early a day as possible. Not long since the company ordered two powerful coal-engines, one of which is in use, doing excellent service, and the other will arrive in three weeks.

Domestic Economy.

ORIGINAL RECIPES.

IT is our intention to make this department of our paper more interesting than hitherto.—For this purpose we invite all our lady readers to lend a helping hand. If you have any recipes that you know to be *good*, never mind whether they are new or old, they will be acceptable. The following were given us by one of the best housekeepers we ever knew.

BLACK WEDDING CAKE.—2 lbs brown sugar, 2 lbs. butter, 2 lbs. flour, 24 eggs, 14 lbs. currants, 6 lbs. raisins stoned and chopped a little, 2 wine glasses brandy, ½ lb. citron, 4 nutmegs, ½ oz. mace, cloves to your taste.

WHITE WEDDING CAKE.—1 lb. flour, 1 lb. pulverized loaf sugar, ¾ lb. butter, 1 lb. of the white of eggs, 2 nutmegs, *oil* of lemon to your taste.

COMPOSITION CAKE.—1¾ lbs. of flour, 1½ lbs. sugar, ½ lb. butter, 4 eggs, 1 pint sour milk, a tea-spoonful of saleratus, spice and fruit to your taste.

BOSTON CAKE.—1 lb. 2 oz. flour, 14 oz. sugar, 12 oz. butter, ½ lb. raisins, 4 or 6 eggs, ½ gill brandy, 1 gill milk.

WAFFLES.—1 lb. flour, ¼ lb. butter, 1 pint of milk, 5 eggs.

TO MAKE APPLE CUSTARD.—Select good sweet apples, such as will cook well; pare, cut, and stew them; when thoroughly done, stir them briskly, till the pieces are all broken fine. Allow the apples time to cool, and thin down to the proper consistency with good milk, and bake with one crust, as you would bake a common custard or pumpkin pie. If a richer pie is wanted, a few eggs may be added. If the apples are totally sweet, but little sugar or other sweetening will be required. If desirable, spices may be added.—*Germantown Tel.*

INDIAN CAKE.—Make a quart of milk boiling hot, stir it into a pint of sweet, white Indian meal, after it has quite cooled, add four beaten eggs, one tablespoonful of wheat flour, one table-spoonful of butter, and a teaspoonful of salt; bake in shallow pans in a quick oven.

Educational.

TO THE TEACHER.

Toil, teacher, toil!
Prepare the soil;
Go forth to sow the precious seed,
To pluck up noxious plant and weed!
Toil, teacher, toil.

Pray, teacher, pray!
Ask God to-day
To fill thy soul with grace and might,
That thou mayst do and teach the right:
Pray, teacher, pray.

Hope, teacher, hope!
The promise take—
Faint not and thou shalt surely reap
In season due. Bear trials well;
Let each day's work thy patience tell:
Hope, teacher, hope.

Go, teacher, go:
The joy be thine,
Rightly to instruct from day to day,
To lead one mind in wisdom's way—
The bliss will all thy care repay:
Go, teacher, go.

LEARNING AND LABOR.—NO. I.

Learning and labor are inseparably connected. There can be no learning without labor, nor successful labor without learning.—The experience of ages attests that intellectual progress is the result of toil—the fruit of stern, untiring application. Those great truths developed by Newton are the golden reward of patient research and close investigation. The power of mind over matter evinced by Watt, in the successful combination of elements seen in the construction of the steam engine, is the result of deep and earnest thought on the part of its originator. Yes, it was hard study and constant application that captured the steam monster, and learning holds in check its fury. Education placed it upon the iron track and bade it move its ponderous train with a meteor's velocity, making the firm earth tremble beneath its angry tread. The hand that dragged the lightning from the mountain cloud, and hurled it with lightning strength in blazing circles on its fiery way, the sun to outstrip in flight, and time to stop in race, received its skill from mental toil.

Education has grasped the sunbeam and used it for a pencil. It has changed the face of this continent from an uncultivated wild, dissonant with the savage yell of the Indian, to a rich and populous republic, musical with the hum of busy life. Thousands of manufactories also bespeak our intellectual greatness. Commerce spreads her white wings to the sunlight of every clime—from Nova Zembla's ice-bound coast to the frozen regions of the Antarctic Sea, the flags of every nation court the same zephyr. Education has spanned the heavens as with a reel, and measured the foundations of the planetary universe, viewed systems beyond systems ranged in wild grandeur in space far beyond our unassisted ken, gave them names, taught the law that holds each in its native course, and weighed the sun in the balance of thought. Thus is learning the grand moving principle through whose agency all the good of which we are the recipients is effected.

Is it not true, however, that all who pretend to be educated are learned. Multitudes from sinister motives are base enough to put on the *show* of learning, while they are entirely destitute of the reality. They see that learning is wealth, and strive to obtain the latter, merely pretending the former. There are thousands at the present time, who, under the garb of a profession, draw from the laboring classes a support for which they return no equivalent. There was a time when learning was a commodity not possessed by all, and those who did possess it felt it duty bound to exercise their talents professionally. Comparatively few were able at those times to meet the expense of a thorough course of study, hence the community was dependant upon the few for instruction. They must devote their time and energy to meet this want. For this expenditure they must be paid. Thus originated the so-called learned professions, which soon became a source of pecuniary advantage as well as a means of accomplishing benevolent designs.

But the aspect of things is fast changing.—Knowledge is now placed within the reach of all. Colleges are springing up on every hand. In every village are established schools of high order. The path to learning is at present almost the only path to distinction. The battle field has lost its attractions, and the young man who pants for fame sees no other course to obtain it than that which lies through halls of science. Many, however, long for fame and wealth who are too indolent to put forth the necessary exertions to acquire an education, which would secure to them what they so much desire, and are hence induced to bring to the market their various professional commodities, glossed and gilded to be sure, and thus palm off mere trash, or worse even, upon a too credulous community. How long will it be, if those who merely ape professional men shall be able to impose upon the people, drawing from the common treasury a support without rendering an equivalent, ere the world will suffer a literary famine? Yet live they will, although this life is but a piratical one, and the people must support them. If the whole system of professional quackery could be exposed to the public in its true light, a glorious work would be effected. O. F. B.

Climax Prairie, Mich., 1851.

SELF-EDUCATED MEN.

In my last I spoke of the difference in schools reported to be good. Such schools, especially those of the second character, lay a foundation for self-education. The student has *learned to think for himself*, and has also *learned how to learn*—how to educate himself. He has only to carry out the plan already begun, and a few years will find him, without much interruption to the business of an ordinary profession, far on the road to a learned reputation. The writer has known many such, who in their early days were among the most unpromising, but who have since distinguished themselves by their attainments in knowledge, as well as in the business of their profession. It is not pretended, however, that even the best schools furnish to our youth the *only* opportunities of rising to eminence. There have been those who, almost without schools, or assistance of any kind, have found their way up through all conceivable difficulties, to eminence and distinction. The love of knowledge, and the determination to be something in the world, have enabled them to remove every difficulty, to surmount every obstacle, even to the astonishment of all. But how much more easily would the same end have been gained had the young aspirants been aided in the outset by a proper course of early mental training? How much greater might their attainments have been in the end? And how many there are of whom we now hear it said, "how unfortunate it is that they had not the advantages of early education?" Aye, and how many more there are whole talents are never developed in this world, for want of suitable early opportunities!

Now it is to aid those who may wish to climb the "Hill of Science," to call out the intellectual but latent energies of those who may otherwise be unknown to the world, as well as to benefit all, that *all* our schools of every grade should be of the right kind,—that they should be nurseries of thought,—that they should, as far as possible, "teach the young *idea* how to shoot," even from the commencement of and during the whole period of school days. Those, then, are the best schools which best answer this end; and that teacher who has awakened in the mind of his pupils a disposition to investigate, and has taught them *how to learn*, even though he may have done little else, has not labored in vain. H.

Ont. West, Aug., 1851.

EDUCATION IN ENGLAND.

According to the calculations and tables given, 968,557 children ought to be enrolled in the school books of England and Wales, over and above the 2,144,378 that are actually found there. This however, is not the only element that demonstrates the actual deficiency of education. A great number of existing schools are of a very inferior description. Out of 29,525 private schools, which sent in returns it is roughly estimated that 4,956 are superior; 7,095 middling; 3,495 undescribed; and no fewer than 13,879 inferior, being principally dame schools, where only reading and writing are taught, the latter not always. That many at least of these schools are rightly described as inferior, is but too apparent from the almost incredible fact, that in the case of no fewer than 708, the census returns were signed with only a mark! The same occurred with respect to 35 public schools, most of which had small endowments!

Yet, notwithstanding these drawbacks, Mr. Mann, who compiled the statistics, regards the condition of the youth of England as infinitely improved during the last fifty years:

"The records and the recollections which describe society so recently as fifty years ago, bear testimony to a state of ignorance and immorality so dense and general, that if any member of the present generation could be suddenly transported to that earlier period, he would probably be scarcely able, notwithstanding many abiding landmarks, to believe himself in England, and would certainly regard the change which half a century has witnessed in the manners of the people as but little short of miraculous. Comparison is scarcely possible between the groups of gambling, swearing children—no unfavorable example of young England then—whom Raikes, of Gloucester, in 1781, with difficulty collected in the first Sunday school, and any single class of the 2,400,000 scholars who now gather with alacrity, and even affection, round their 318,000 teachers."

Important Truths.—In a work lately published by Lieber on civil liberty and self-government, he says, "There is no right without a parallel duty; no liberty without the supremacy of law; no high destiny without earnest perseverance; no greatness without self-denial."

The toiling millions who dig up riches from the ground, are the true benefactors of the world. There is no intelligent and patriotic man who does not rejoice in their prosperity; for the benefits it confers upon themselves, and upon their country.—*Orleans Republican.*

Useful Olio.

PHILOSOPHICAL LECTURE.

We promised in our last lecture to give some account of the construction and management of a Canal, and will now endeavor to redeem the pledge. If the surface of the earth along the line of a proposed Canal were a dead level, or more philosophically speaking, if it were the arc of a circle at every point equidistant from the centre of the earth, all that would be necessary in the construction, would be to excavate a ditch of the proper dimensions and shape, and fill it with water; but in actual experience, no such line can be found of sufficient extent, and hence the necessity of engineering skill and an immense outlay of money and labor. Mountain barriers must be penetrated or overleaped, rivers must be crossed, deep ravines filled up, long terraces of country of different elevations connected by water communication, and innumerable other obstacles met and overcome.

In some respects the skill of the civil engineer is taxed to a greater degree in building a Railroad than a Canal; but in others, and in far the larger number of instances, the requirements of scientific knowledge in constructing the latter, must be easily superior. It is true that the curves of a Railroad must be much more carefully constructed than those of a Canal; the relative elevation or depression of the opposite rails, to counteract effects of centrifugal force, must be properly attended to; the true adjustment of switches, and frogs, and turn-tables, of rail-guards, and road-crossings, of viaducts, and transit bridges, of tie fixtures, and ballasting must never be lost sight of; but in the laying of a Railroad across a country, alternate rises and depressions of many feet in a mile, are no obstacle, while in the construction of a Canal the deviation of as many inches will render the work utterly ruinless; and the unskillful engineer will be chagrined to see the liquid medium intended to float his boats all rushing to the lower end of his new ditch. Indeed, the descent of a Canal line must not be made to exceed *half an inch* in the mile, while that of a Railroad varies from a dead level to fifty or seventy-five feet. The retention of the water in a Canal is an all important item; and hence the nature of its embankments requires great attention; its masonry, &c., must be carefully constructed, and placed below all chances of being undermined by water, which will penetrate every crevice, and speedily change the trickling leakage into a gaping breach. In a Railroad, the tender can take on a supply of water, in the vale below, sufficient to carry the train over a summit, and down again to the vale beyond; while in a Canal, a quantity must be found not only sufficient to fill the ditch and make up for natural leakage and evaporation, but also to supply the exhausting process of downward leakage, at both ends.

In the Erie Canal, which is the foremost work of its kind in the world, and a monument of more enduring fame than the Pyramids, the longest level on the line is about seventy miles. The earliest idea of its construction was a line of uniform descent from Lake Erie to the Hudson, by means of alternate excavations and embankments to suit the undulations of the intervening country; but a little knowledge of the difficulties in the way of such an undertaking, speedily exploded that idea; for the united energies of the world would scarcely be commensurate to its fulfillment. The true idea finally developed itself under the fostering care of master minds, and resulted in the construction of the present work. This was accomplished by means of successive and varying levels to suit the undulations of the country through which the Canal passes; the boats being lifted and let down from one level to another by means of locks. The greatest descent at any one point in the line is at Lockport, where the Canal passes from the level of the Lake Erie terrace above the Falls of Niagara, down to that below; which is effected by a series of six locks in immediate succession, like a pair of stairs.

Let us endeavor to explain the shifting of a boat from one level to another, on a Canal.—The water of the upper level is retained by means of guard gates, which, when opened, allows it to flow into the level below. There are two sets of these gates, one at each end of a strong flume, constructed of stone laid in hydraulic cement, and built in the most substantial manner. Now suppose the lower set of gates to be closed, and the water allowed to pass in above; it is evident that the flume will soon be filled even with the surface of the upper level, so that a boat will float into it without difficulty. If now the upper gates be closed, and sluice-gates opened below, the water will be drawn off from the flume or lock, down to the lower level, the boat at the same time settling with the water; after which the large gates can be opened below, and the boat permitted to pass on its way. When the water in the lock is even with that in the lower level, an upward bound boat passes in and the gates behind it are closed. Now fill the lock from the level above, and when the water rises in it even with the upper level, the large gates above are opened, and the imprisoned boat set free. The simple apparatus of a lock is more effective in elevating vast weights, than the most complicated engine; and the largest ship that ever floated, can thus be lifted as easily as a gentle zephyr would lift the downy thistle on its bosom.

The Erie Canal, when enlarged, will be seventy feet wide and seven feet deep, walled up with shping masonry on each side, and lined with double locks throughout its entire length. It will float boats carrying a burthen of two hundred and forty tons, which is equivalent to the burthen of two Railroad trains.—Through this vast avenue a mighty tide of internal commerce will be carried on, enriching the people East and West, and binding them together in indissoluble ties. Unlike the monopoly of a Railroad, every man can do business on the Canal; only paying to the State, for the privilege, an amount of toll sufficient to keep the line in repair, and ultimately pay for its construction. No profits, no dividends, no exclusive advantages are retained to a particular set of men, but the whole is thrown open on terms of the widest and freest democratic equality.

WILD ELEPHANTS.

A person who has never seen a wild elephant, can form no idea of his real character, either mentally or physically. The unwieldy and sleepy-looking beast who, penned up in his cage in a menagerie, receives a sixpence in his trunk, and turns around with difficulty to deposit it in a box; whose mental powers seem to be concentrated in the idea of receiving buns tossed into a gaping mouth by children's hands; this very beast may have come from a warlike stock. His sire may have been the terror of a district, a pitiless highwayman, whose soul thirsted for blood; who lying in wait in some thick bush, would rush upon the unwary passer-by, and know no pleasure greater than the act of crushing his victim to a shapeless mass beneath his feet. * * * I have even heard people exclaim, upon hearing anecdotes of elephant hunting, "poor things!" Poor things, indeed! I should like to see the very person who thus expresses his pity, going arm in arm with a savage elephant after him. Give him a lance to run upon if he dares, and see the elephant gaining a foot in every yard of the chase, fire in his eyes, and fury in his headlong charge; and would not the flying gentleman who lately exclaimed "poor thing!" be thankful to the lucky bullet that could save him from destruction? There are no animals more misunderstood than elephants; they are naturally savage, wary and revengeful, displaying as great courage when in their wild state as any animal known. The fact of their great mental sagacity renders them more dangerous as foes. Even when tamed there are many that are not safe for a stranger to approach, and they are then only kept in awe by the sharp driving hook of the mahout.

Elephants are gregarious, and the average number in a herd is about eight, although they frequently form bodies of fifty and even eighty in one troop. Each herd consists of a very large proportion of females, and they are constantly met without a single bull in their number. I have seen some small herds formed exclusively of bulls, but this is very rare. The bull is much larger than the female, and is generally more savage. His habits frequently induce him to prefer solitude to a gregarious life. He then becomes doubly vicious. He seldom strays many miles from one locality, which he haunts for many years. He breaches what is termed a "rogue." He then employs the natives, and, in fact, becomes a scourge to the neighborhood, attacking the inoffensive without the slightest provocation, carrying destruction into the natives' paddy-fields, and perfectly regardless of night fires or the usual precautions for scaring wild beasts. The daring pluck of these "rogues" is only equalled by their extreme cunning. Endowed with that wonderful power of scent peculiar to elephants, he travels in the day-time *down* the wind; thus nothing can follow upon his track without his knowledge. He winds his enemy, as the cautious hunter advances noiselessly upon his track, and he stands with ears thrown forward, tail erect, trunk thrown high in the air, with its distended tip pointed to the spot from which he winds the silent but approaching danger. Perfectly motionless does he stand, like a statue in ebony, the very essence of alert coolness, every nerve of scent and hearing stretched to its cracking point; not a muscle moves, not a sound of a rustling branch against his rough sides; he is a mute figure of wild and fierce eagerness. Meanwhile the wary tracker stoops to the ground, and with a practised eye pierces the tangled brushwood in search of his colossal foe. Still further and further he silently creeps forward, when suddenly a crash bursts through the jungle; the monarch has arrived for the undivided charge, and the elephant is upon him.—*Baker's Rifle and Hound in Ceylon.*

Fact.—The man who devotes a whole life to accumulate wealth is a donkey. The moment he obtains a competency he should quit trade, buy a neat little coop in the country for his hens and chickens, and immediately afterwards give himself up to the cultivation of drum-head cabbage and a higher grade of morality.

Neither in little things, nor in great ones, suffer your dread of singularity to turn your feet from the path of integrity. Arm yourselves with this mind, to do what is right, though you can find neither companion nor follower.—*Rev. J. A. James.*

Sunday Reading.

[Written for Moore's Rural New-Yorker.]

THE FORSAKEN TEMPLE.

BY HORACE S. KENSEY.

View life's temple; it was gleaming
Yesterday with beauty bright,—
Came through stained windows streaming,
Beams of intellectual light.

And its door, on smoothest hinges,
Swung was by the breath of love;
From its organ flowed sweet measures,
Such as angels chant above.

On this temple breathed Jehovah,
And with thought inspired the whole,
When from turret to foundation,
It became a "living soul."

Oh! how changed is its appearance,
Quenched its vivifying light;
Hushed its gentle, thrilling music,
"All within is dark as night."

To our call no voice will answer;
View the mildew and the rust,
"Perishing" is on it written,
"'Earth to earth, and dust to dust.'"

Vanished hath the gentle tenant,
See Death's signet on the door;
Where is she, Oh! angels tell us,—
Whom we love, but see no more!

"She of wild, forbearing spirit,
Sought a city far away,
And hath gained a glorious mansion,
Which shall never know decay."

Kanona, Steuben Co., N. Y., 1850.

THE PREACHING WE LIKE.

We ask for no polished periods, for no finished compositions, but simply for burning thoughts, couched in simple and homely phrase such as those which in other days drew men from the earth to heaven. The shibboleth which Roman priests and even the most dignified among the number, and also which some very learned Protestant divines are not ashamed to send forth to the world, is something quite inconceivable, to those at least who have not been nurtured on diet of this kind. We know some plain and unpretending ministers in the Lutheran Church, who seldom quote Greek or poetry, and scarcely ever stop to find fault with, or improve the translation of their text, whose language is so simple that a child can understand it, and who never for a moment aim at polish, elegance, or distinction, but only at converting sinners, and edifying saints. Such men are know and have heard, and would rather sit statedly under their preaching, and have them visit us on a death-bed, than be the parishioner of the most learned, accomplished, and so-called distinguished minister we ever heard, who is more concerned for his own professional reputation than for the salvation of his flock. Away with your elaborate, pretty, polished sermons, designed to show off the learning and rhetoric of the minister, and secure applause from a fashionable audience, while immortal souls are left to perish for want of simple gospel instruction. Such preaching is an abomination to God, the delight of the devil, and should be a reproach and a by-word among men. One simple, solid, gospel sermon, delivered with feeling and earnestness, and amid fervent prayer for God's blessing, is worth scores of beautiful, classic, and so-called eloquent efforts.—*Lutheran Observer.*

RELIGION.

There is a religion in everything around us; a calm and holy religion in the unbreaching things of nature, which man would do well to imitate. It is a mild and blessed influence, stealing, as it were, unseen upon the heart. It comes—it has no terror, no gloom in its approaches. It has nothing to rouse up the passions; it is unthinned, by the creeds and unshadowed by the superstitions of man. It is fresh from the hands of the Author, and glowing from the immediate presence of the Great Spirit which pervades and quickens it. It is written on the arched sky. It looks out from every star. It is among the hills and valleys of the earth; where the shrubless mountain top pierces the thin atmosphere of eternal winter; or where the mighty forest fluctuates before the strong winds with its dark waves of green foliage. It is spread out like a legible language upon the broad face of the unsleeping ocean. It is the poetry of heaven. It is this that uplifts the spirit within us, and it is tall enough to overlook the shadows of our place of probation; which breaks, link after link the chain that binds us to mortality; and which opens to imagination a world of spiritual beauty and holiness.—*J. G. Whittier.*

Light in Darkness.—"Unto the upright there ariseth light in darkness."—Psa. cxii. 4.

The great lesson of this text is the connection which obtains between integrity of purpose and clearness of discernment, insomuch that a dutiful conformity in what is right is generally followed up by a ready and luminous discernment of what is true. It tells us that if we have but grace to do as we ought, we shall be made to see as we ought; or, in other words, that if right morally, we are in the highway of becoming right intellectually. —*Dr. Chalmers.*

Embargo on Bibles.—Recently the British Foreign Bible Society went to considerable trouble and expense to have the Bible translated and printed in the language of the Mongol Tartars; but the Czar of Russia, who is the master of the Mongols, having, in advance, forbidden its circulation, the whole edition remains useless on the Society's shelves in London. The Czar evidently does not want Christian civilization among his Tartar subjects.—Religious light is no part of his system.

The passion of acquiring riches in order to support a vain expense, corrupts the purest soul.

Miscellaneous.

[Written for the Rural New-Yorker.]

AUTUMN.

BY J. W. BARKER.

Autumn again is here,
Upon the laid sky, her form
Is painted mid the gathering storm,
And the revolving year,
Its rich Autumnal offering brings,
The harvest of the genial Spring.

The bright and joyous Spring,
Danced o'er the earth, with laby foot,
Kissed the green sod, and the glad root
The gentle whisp'ring,
With joy received,—the balmy air
Caught the rich fragrance every where.

The Summer's golden blaze,
Athwart the landscape darting now
From valley to the mountain's brow,
To life inspiring rays,
Thro' nature wanders,—hill and plain,
Are rich in living green again.

'Tis vanished now and gone,
In sable folds around the sky,
The clouds in heavy columns lie;
As round some cherished form,
A group of weeping mourners stand,
And point you to the spirit land.

The silver-tongued rill,
That thro' the sultry day
Refused the wild to its gushing lay,
Now rushes down the hill,
And sings in measures wild and clear,
The requiem of the dying year.

Along the skirting shore,
Withered and pale the flowers lie,
Of late so charming to the eye,
Their days of beauty o'er;
Like the fair forms of life in bloom,
They sleep upon their peaceful tomb.

Amid the forest deep,
Where the bright leaves bare woven a screen
Thro' which the sunbeams slide between,
I hear a fairy step
Upon the tree-tops,—all around,
The leaves are sailing to the ground.

Autumn again is here,
I know her many voices well:
Nigh thirty times her songs have fell
Upon my listening ear;
Each leaf, each song, each faded flower,
Reminds me of life's transient hour.

Brockport, N. Y., 1854.

LEAVES FROM A TRAVELER'S NOTE-BOOK.

NO. II.—THE MILAN CATHEDRAL.

But thou, of temples old, or altars new,
Standest alone—with nothing like to thee.—BYRON.

The Cathedral, or Duomo, of Milan, enjoys great celebrity, and the Milanese, who may well be proud of the crowning glory of their beautiful city, have named it the eighth wonder of the world. This superb structure has often been minutely described, yet no description has, or ever will be given, that can convey the least idea of its beauty and magnificence. Let any one that has never gazed upon the beautiful proportions of 'Il Duomo,' picture to himself the most fanciful and most entrancing beauties of Gothic architecture he has ever seen or imagined, and he will fall far short of the splendor of this temple, that its talented projector has left behind him as a monument to commemorate forever his genius and his talent. This superb fabric, so unique in character and elaborate in execution, is without a parallel, and has been compared to a river of marble shot into the air and petrified while falling. Everywhere is a lavish profusion of ornament; every foot of the surface of its immense façade is decorated with statues and bas-reliefs in endless variety, and a thousand spires and needles, covered with beautiful fret-work and delicate tracery, rise above it like a marble forest, each pinnacle surmounted with a statue that stands out boldly upon the soft Italian sky. A flight of steps leading to five doors, in the Roman style, corresponding to the five naves within, offers entrance to the temple. Entering, the mind at once becomes bewildered in contemplating the new beauties that burst so suddenly upon the view; no matter how lofty one's ideas have been raised by description,—no matter how brilliant and how beautiful, how gorgeous and sublime, his fancy has painted its internal splendors, he will be overwhelmed with astonishment, and stand spell-bound beneath its high-arching roof, enraptured with its airy magnificence,—and as he stands there in the "dim, religious light" that plays so softly through the stained and painted glass of its enormous windows, a feeling of exquisite enjoyment and calm repose, mingled with a sombre and reverential awe, will steal gently upon him. Within, as well as without, everything is elaborated in the highest degree; exquisite productions of the sculptor's chisel, beautiful pictures, so astonishingly life-like and natural that you can only wonder at the painter's skill,—lofty columns, with caps and bases most artistically carved, and every other conceivable kind of ornamental devices in marble, are scattered profusely throughout the vast interior. In an underground chapel is deposited the remains of San Carlo, the Patron Saint of the Cathedral; they are in a glass coffin, through whose transparent sides his shrivelled, mummy-like body may be plainly seen, clothed in ecclesiastical robes; on his bony fingers are placed a number of costly glittering gems.

Ascending to the roof, or rather succession of roofs,—for there is more than one,—by a winding inclined plane, a beautiful spectacle delights the eye, and as you wander through the grove of marble pinnacles, you become amazed, and can but wonder at the patience that must necessarily have been exercised in their design and execution. Two hundred pinnacles, and over *fifteen thousand* other points, are reared high up above the roofs, embellished with more than *five thousand* statues of the human form, each different in design. On one of the roofs is the Botanic Garden, as it is called—*a garden stocked with marble flowers*. Here are to be seen plants of every kind, with flowers, leaves and buds, together with fruits of every clime and country that have sprouted from the sculptor's chisel, to flourish perpetually in this charmed, sunless garden, without the care and attention that a natural one requires. J. M. B.

Rahway, Sept. 20, 1854.

A ROMANTIC TALE.

There is a memory of the old church in which we worshiped yesterday, connected with the old man who will be buried to-morrow, that seemed to me very touching when I heard it related last night. Sixty years ago, there was a voice in the choir that thrilled his heart every Sunday morning, so that he listened to it more than the words of the song. He was a stout strong man, and yet was a child in the presence of that country maiden, and he loved her with exceeding joy. He served her father not so long as Jacob for Leah, yet with no less devotion, and for a while with no more success. One day the farmer's family had gone to visit a friend some ten miles the not, and not having room in their wagon, they had returned, leaving Lucy to be escorted. And toward evening, the old man, the young man I should say—how strange this tale of his youth seems to me, who have always known him so old—the young man was sent for her, and, having taken her into the wagon with him, started to return.

Five miles of the road were accomplished when the gloom of a tempest surrounded them, and a storm burst on them with terrible fury. There was no better shelter for a mile, save the old church that stood alone upon the hill, and thither he urged his horse with difficulty and no small danger.

They reached the door, which was never closed—for the house of God, in those days was always open—and the girl found shelter, while he secured the horse in safety under the shed, and returned to her.

He had never told her of his love, and now was a fair opportunity. In the wild flashes of the lightning, the little church gleamed out on the valleys that it overlooked, like a silent monitor, to keep all safe in the war of the elements. No one who caught sight of it that night, dreamed that it was occupied; but there were two hearts in it that commenced to beat in unison that night at the altar where they pledged their love to each other. They were not afraid, not terrified, though the tempest was fearful and though every window gleamed luridly in the constant flashes of the lightning; with arms folded around each other, they knelt there still. It was a holy night, to which in after years their souls recurred with never ceasing joy.

Yes,—sneer—laugh—blaspheme that holy love, poor miserable dogs of the world's whipping, who have never felt the blessedness of warm, pure, woman love, but know that man worshipped God at the same altar, he never forgot that night, nor failed to thank God for that tempest. And to-morrow when they carry him into the church again and lay him down prone at the altar foot whereby he knelt with the maiden he loved so long ago, if his old bones revive not at the blessed touch, if his old heart thrill not with the remembered love, if his old cheek grow not warm with the balmy breath, if his old eyes smile not with the old love, if he be there still, calm, dead, now I tell you there is an altar, a church, a bond, where they two will be kneeling together to-morrow, where their eyes will be radiant with love, where their lips will be eloquent with rapturous song! "Again, and yet again," saith Joe Willis, looking over my shoulders as I write—"I thank God for the immortality of our love."
—W. in *Journal of Commerce*.

Self-Reliance.—There is a time in every man's education when he arrives at the conviction that envy is ignorance; that imitation is suicide; that he must take himself for better, for worse, as his portion; that though the wide universe is full of good, no kernel of nourishing corn can come to him but through his toil bestowed on that plot of ground which is given him to till. The power which resides in him is new in nature and none but he knows what that is which he can do, nor does he know until he has tried. Not for nothing one face, one character, one fact makes much impression on him, another none.—*R. W. Emerson.*

Be Peaceable.—"If it be possible, as much as lieth in you, live peaceably with all men," is a command of high authority, and of all men in the world, the farmer generally, has most to lose and the smallest prospects of gain, in petty law suits with his neighbor. It is an old saying—"when a man wishes to beat a dog he has no difficulty in finding a stick." So, if he is disposed to quarrel with his neighbors, he has no trouble in finding, or making fit occasions, and finding all the instruments for his purpose.—*A. Thomas's Address.*

The Newspaper.—How lonesome is the fireside where there is no newspaper! Ask the man who has a family paper to read, with the latest news, the good stories, the useful lessons, and witty sayings of the newspaper—ask him its value. Let him be deprived of it for a few weeks, and then ask him to put an estimate upon it. It will have risen above all price.

Ladies' Department.

CONDUCTED BY A——E.

THE LIGHT AT HOME.

The light at home! how bright it beams
When evening shades around us fall;
And from the littlee far it gleams;
To love, and rest, and comfort call.
Who wearied with the toils of day,
The strife for glory, gold, or fame,
How sweet to seek the quiet way,
Where loving lips will lisp our name
Around the light at home!

When through the dark and stormy night
The wayward wand'rer homeward hies,
How cheering is that twinkling light,
Which through the forest gloom he spies!
It is the light at home; he feels
That loving hearts will greet him there,
And softly through his bosom steals
That joy and love that banish care,
Around the light at home.

The light at home, when'er at last
It greets the seaman through the storm;
He feels no more the chilling blast
That beats upon his manly form.
Long years upon the sea have fled
Since Mary gave her parting kiss,
But the sad tears which then she shed,
It all now be paid with rapturous bliss,
Around the light at home.

The light at home! how still and sweet
It peeps from yonder cottage door—
The weary laborer to greet—
When the rough toils of day are o'er;
Sad is the soul that does not know
The blessings that the beams impart,
The cheerful hopes and joys that flow,
And lighten up the bravest heart,
Around the light at home.

Trans-Atlantic Epistles,

TO COUSIN KATEY.

Communicated thro' Moore's Rural New-Yorker.

EPISTLE TWELFTH.

Roman Mosaic, ancient and modern—Mosaic ornaments, process by which they are made—Florentine Mosaic, materials used, mode of manufacture—Mosaic tables—St. Peter's Chapel—Shell Cameos, how made—Coral, Lava and Shell work—Italian jewelry.

Dear Katey:—You have seen, or at least heard, of *Roman Mosaic*. It is no modern invention, for it was extensively used in the floors of the baths and other edifices constructed by the luxurious old Emperors, and large portions of these antique pavements remain to the present day. Of modern mosaic, Rome is full. The interior of the dome at St. Peter's is entirely composed of it, and most of the pictures which adorn the altars of this Church are also in mosaic. This kind of work seems to have partially superseded fresco-painting for the decoration of churches, and it certainly possesses one advantage over it, that of being exceedingly durable. The modern mosaic is not precisely similar to the ancient. This was formed of pieces of marble about half an inch square, united to each other, and to the foundation upon which they were placed, by a thick layer of cement. The variety of colors was, from the nature of the material, quite limited, and, accordingly, in the antique mosaics are usually find the ground-work white, and the design quite simple, the figures being arranged, not in groups, but simply in different compartments. Modern mosaic is made of a kind of composition called *smalto*, hard enough, when cold, to be susceptible of a fine polish, but easily softened by exposure to heat. This is made of all possible varieties of color, no less than 20,000 different shades being kept in the manufactory of the Vatican. The workmen, having this almost inexhaustible range of colors to resort to, are not obliged to limit themselves to the simple combinations of the ancients, but can copy the finest oil paintings, in a manner so perfect that one is obliged to approach near enough to put his hand upon the work, before he can be convinced that the soft shades and delicate outlines before him, are really produced by a conglomeration of bits of *smalto*, and not by the skillful touch of the artist's pencil. The effect is very similar to a handsome piece of worsted embroidery, such as you, Katey, used to be continually employed upon. You know, that to judge of its appearance, you would hold it at a little distance, and then the tiny squares formed by each stitch were no longer visible, but dissolved themselves into smooth, flowing lines and shades. Just so with the mosaic, which is only worsted-work on a large scale, done by men, with a little different material from that which ladies use. The finer the work, the longer the time necessary to complete a piece, and the more valuable when finished. A Madonna, now in progress at the manufactory of the Vatican, will require nine years of labor. The medallion portraits of the Popes, a series of which are now being made for the new Church of St. Paul, require one year each.

But there is another point of view in which Roman mosaic is particularly interesting to the fair sex. From it are formed brooches, bracelets, ear-rings, ornaments of every kind for their particular use. The designs upon these are more simple, as the space is so circumscribed. There are three different styles in vogue, animals, flowers, and the monuments of Rome, the latter of which are much the prettier to my taste, being souvenirs of the famous places which one has visited, as well as ornaments.—In my shopping excursions in search of these articles, I frequently saw workmen busy in their manufacture. Each has a spirit-lamp burning by his side, and the *smalto* prepared by being drawn into long, narrow strips, varying in size according to the fineness of the work. His pattern lies before him, and the foundation of the article which he is to make. This foundation or ground-work is also of *smalto*, black or a golden brown, run into the proper form, and a depression sunk into the middle, which is covered with a coat of cement to receive the mosaic figure. The workman cuts the *smalto* into small bits, seizes each with a pair of nippers, and after applying one end to the flame of the spirit-lamp until it becomes soft, sets it upright in its destined place upon the bed of cement. As it hardens, it becomes solidly attached, and in this manner he proceeds, forming first the principal outlines, and afterwards filling up and completing the figures. Then the ends of *smalto* which project too far, are removed, the mosaic is brought to a uniform surface, polished, and the ornament is ready for the first fair stranger whose taste and whose purse are pleased with it.

We afterwards saw the *Florentine mosaic*, manufactured, as its name implies, at Florence, and differing entirely from the Roman mosaic, both in material and in process of construction. The substances employed in this mosaic consist solely of choice marbles and precious stones, and the colors are all natural. The materials are prepared by being sawed into very thin slabs, or rather *slices*, and for the ground-work a kind of fine black marble, called *touch-stone*, is used. This is cut into the required shape, the design is sketched upon it, and then the workman proceeds to cut out all of the ground-work which is covered by the figure, replacing each part by minute fragments selected from his store of materials, and corresponding in color to the object which his pattern represents. For example, the *forget-me-not*, a flower which one often sees in these mosaics, is formed of *turquoise*—the *white lily*, of a semi-transparent marble, with delicate, pearly shades. Much taste and judgment are needed in the selection of the pieces which are to be inserted, not only that the colors may be appropriate, but that every shade and vein in the stone may find its proper place, and aid in giving beauty and correctness to the figure.—The number of pieces used in making up a design is very great, an ordinary sized brooch containing from 40 to 100, and each bit is fitted to its place with the utmost nicety, so that the joints are quite imperceptible, and at first glance one would pronounce the work a painting, rather than a mosaic. This kind of mosaic is employed not only in ornaments for the toilette, but in landscapes, in tables and other articles of furniture, and, in one instance, at least, the decoration of a chapel. In the manufactory which we visited, we saw several small round tables destined for American gentlemen, and in the Museums at Florence are many magnificent specimens of this mosaic. At the Uffizi palace is a table which employed twenty-two artists twenty-five years, and cost nearly $100,000. In the Pitti palace are several tables, less costly, with designs less complicated, but to my taste more graceful and pleasing. The pattern of one represents strings of pearls, coral, shells, and other marine productions. The pearls are genuine pearls set into the stone; the coral is also veritable, and the shells are made so perfect, by a skillful selection of materials and blending of shades, that one almost fancies he can take them up in his hand. Another table displays different fruits, the grapes of purple amethysts, looking luscious and tempting enough to make one's mouth water. Still another represents a service of china, the graceful, antique forms of the different vases, and the delicate texture and hues of the porcelain, with the light faintly stealing through it, being depicted to the very life.

The famous, modern Medicean Chapel in the Church of San Lorenzo, at Florence, exhibits this mosaic on a large scale. The high walls, to the very ceiling, are cased with precious marbles, fancifully wrought in patterns, while a series of armorial bearings, around the lower part, are finely executed, but I was disappointed in the general effect. There is much magnificence and richness about it, but little grace or beauty, and the old Chapel interested me much more, decorated, as it is, with statues by Michael Angelo, one of which, the figure of Lorenzo di Medicis, is so transfused with soul and character that it has been named "The Thought of Michael Angelo."

Shell cameos are beautifully cut at Rome. The manufacture of these, of ornaments in Roman mosaic, and of other articles of jewelry, seem to be the only kinds of business which thrive here, and the number of workmen engaged in these branches is very great. A cameo-cutter must possess, to a certain extent, the same qualifications as a sculptor, for his art is, in reality, bas-relief, a species of sculpture, and the examination of a skilfully executed cameo affords me almost the same amount of pleasure as that of a fine piece of statuary. The designs consist chiefly of heads, representing some character of Grecian mythology, and often copies from a famous antique or modern statue. At present cameos with a dark brown ground-work, and having the figures in high relief, are most fashionable. To make cameos, the proper shells are first selected, and cut into pieces of the required size and shape. One of these pieces is then solidly attached, by means of a kind of gum, to a short, wooden handle. This the workman holds in one hand, and with the other uses his instruments, which are quite similar to those employed in making plates for steel engraving. His model lies before him, and from this he first sketches the outline of his figure, and then proceeds, with careful strokes, to finish it up. The figure is cut entirely from the opaque white substance which forms the outer layer of the shell. The semi-transparent inner coating is the ground-work, and after the design is completed, all the white surface is cut away from this, and it receives a fine polish. This leaves the head or other figure standing out like a white marble bas-relief from a ground-work of light or dark brown, according to the inner surface of the shell. Sometimes patches of the brown color occur in the white portion of the shell, and, in this case, a design is selected, such that the dark spots can be cut away where they would mar the effect, and allowed to remain where they add to the beauty of the work. Stone cameos are also made in Rome, by a process similar to that which I have described, from the half-precious stones, such as onyx, jasper, &c. The greater value of the material and the difficulty of working it make this latter kind of cameo very expensive, but beautiful shell cameos can be purchased quite reasonably.

In Naples and in Leghorn, *coral* ornaments are extensively manufactured. Much of the shaping of this material is done with the grind-stone. We visited a manufactory where scores of females were seated, each with her little grindstone before her, and the whirr of the instruments was like that of a dozen spinning-jennies. Where heads are cut upon the coral for brooches, ear-rings, &c., after the manner of cameos, this part of the business must of course be done by hand, but it is quite difficult, on account of the hardness of the material, and for this reason, works of this kind fall far behind the shell cameos in delicacy and beauty of execution.

Lava-work abounds in Italy, or rather what is called lava-work, there being very little genuine lava about it, but instead a kind of composition made of various colors, with heads and other figures moulded upon it. Genoa is famous for its *filigree work*, and Venice produces very pretty ornaments, made of small, pearly shells, strung together and variously arranged. So you see, cousin Katey, there is no lack of opportunity for buying in a stock of jewelry in Italy, and I fancy few ladies, visit this country without bringing away more or less of these costly toys, either as accessories to their own toilette, or remembrances to far-off friends. I am no exception to the ordinary rule, and I assure you, Katey, you were not forgotten in my selection of trinkets, but a beautiful cameo head, a copy from the Apollo di Belvidere, lies stored away in one of my boxes for "Cousin Katey." Minnie.

Faithful Forever.—It is a dear delight for the soul to have trust in the faith of another. It makes a pillow of softness for the cheek which is burning with tears and touch of pain. It is an undeferred seclusion into which the mind when weary of sadness may retreat for a caress of constant love—a warmth in the clasp of friendship, forever lingering on the hand—a consoling voice that dwells with an eternal echo on the ear—a dew of mercy falling on the troubled hearts of this world.—Bereavements and wishes long withheld, descend sometimes as chastening griefs upon our nature, but there is no solace to the bitterness of broken faith.

The Better Land.—Our relatives in eternity outnumber our relatives in time. The catalogue of the living we love becomes less, and in anticipation we see the perpetually lengthening train of the departed; and by their flight our affections grow gradually less glued to earth, and more allied to heaven. It is not in vain that the images of our departed children, and dear ones, are laid up in memory, as in a picture gallery, from which the ceaseless surge of this world's cares cannot obliterate them: they wait there for the light of the resurrection day, to stand forth holy, beautiful and happy—our fellow-worshipers for ever.

Happiness is a swift-winged fairy whom human nature has been endeavoring to entrap for ages, but in vain. Youth think that a short time only will elapse ere it will be within their grasp; but, as year after year rolls on without the attainment of the object, hope sinks within the breast. It does not die, but remains dormant, ready to be kindled into new life by the slightest glimpse of the fairy who once appeared so near.

Strive, strive my soul, to be innocent; yea! beneficent. Does any man wound thee, not only forgive, but work into thy thought intelligence of the kind of pain, that thou mayest never inflict it on another spirit. Then its work is done; it will never search thy whole nature again. O, love much, and be forgiven! —*Margaret Fuller.*

MOORE'S RURAL NEW-YORKER

ROCHESTER, OCTOBER 21, 1854.

Important War News!

The Baltic brings important news from the seat of war, to the effect that Sevastopol has been captured, after two or three sanguinary field engagements. The forts were taken by storm, some 20,000 Russians reported killed, ten ships sunk, and 22,000 men made prisoners of war.

If this be true, and there is little reason to doubt its correctness in the main, the power of Russia is annihilated in the south of Europe, and in Western Asia. Sevastopol was the great naval arsenal of the Czar upon the southern borders of his Empire, and was fortified and defended to the extent of his means and power. It was the point in which he was accustomed to concentrate his armies and navies, and whence he sallied forth to overawe and reduce the neighboring petty sovereigns beneath his sway.

It served as a base of operations against the Turks, the Circassians, and all those nations who have partially held in check the all-grasping ambition of Russia. It was in fact the Gibraltar of those seas. That stronghold has fallen, the prestige of invincibility which was wont to attach to Russian armies in that direction broken through, and the terror of the Russian name overthrown. If the Allies would strike one blow as decisive in the Baltic as this is likely to prove in the Black Sea, it would then be in their power to dictate terms of peace to the enemy, and shut once more the gates of the two-faced demon of war. That such will yet be the case, appears now quite probable; as the withdrawal of the French fleet has been countermanded, and rumors are afloat of an attack upon Cronstadt intended by the Allies. The English fleet is reported before Revel, at the entrance of the Gulf of Finland, at the head of which, and easily within reach, are situated Cronstadt and St. Petersburg.

Conviction of Dr. Graham.

Dr. Graham who was on trial at New York for the murder of Col. Loring, as stated last week, has been convicted of manslaughter in the second degree. The trial lasted six days and during its progress it was ascertained that one of the jurors, George Wellman Wright, was cousin to Mrs. Graham, and as such legally disqualified to sit as a juror. No action, however, was taken by the District Attorney until after the remaining eleven jurors signed a petition to the Court, asking that the qualifications of the jurors be inquired into, and if the report proved true, that they be discharged from further service on the trial.

After a good deal of discussion and difficulty, the obnoxious juror was withdrawn by consent of all parties, and a verdict rendered by the remaining eleven, in the name of the twelve. The jury were out eight and a half hours, and finally returned a verdict at a quarter past three o'clock in the morning.

The statutory punishment for manslaughter in the second degree, is imprisonment in the State prison for a term not less than four, and not more than seven years, at the discretion of the Judge.

The counsel for the prisoner have obtained a stay of proceedings for twenty days to enable them to file a bill of exceptions.

The Recent Elections.

The elections which came off last week Tuesday in the great States of Ohio, Pennsylvania, and Indiana, have resulted in some of the most astounding party revolutions yet experienced in those days of political somersets.

In the first and last named States, it is believed every Congressman is either a Whig or Anti-Nebraska Democrat; and in Pennsylvania the result stands—Nebraska men 3; Anti-Nebraska Democrats 5; Native 1; Anti-Nebraska Whigs 16.

Governor Bigler, of Pennsylvania, who three years ago was elected by a majority of more than 8,000, now falls behind Pollock (Whig) nearly if not quite 30,000 votes.

In Florida, which also held its election recently, the Democrats have carried both branches of the Legislature, thus securing the election of a U. S. Senator.

Apples for the East.—The *Democrat* says that Mr. James Upton, of Greece, an extensive agriculturist, has shipped twenty thousand barrels of Apples to New York, by canal, this season, and has now several boats loading with the same fruit. He purchases Apples at all points hereabouts, accessible to the canal. The crop this year is an excellent one, better than those of several previous years, and the demand for the fruit abroad makes it a profitable one.

Grove Farm, Canandaigua, offered for sale in this paper, is one of the most desirable suburban and farm residences in Western New York. Having visited the premises, we can confidently endorse the description given as entirely within bounds. It would be a good investment at the price named, aside from other considerations.

Gov. Crosby, of Maine, has appointed Thursday, the 30th of Nov., as Thanksgiving Day.

Shipwreck and its Suggestions.

When a great calamity like the destruction of the Arctic occurs, men are apt to speculate upon the causes, and to suggest expedients which if put in practice at the time, might have averted, or at least mitigated the catastrophe; but it ought to be borne in mind that sitting down calmly, with all the circumstances clearly developed, to reason upon the matter, is very different from acting at the moment with imperfect knowledge of the state of things, and with immediate destruction staring us in the face.

It will appear evident to most men that a high rate of speed under the circumstances in which the Arctic was lost, is hazardous in the extreme; but it is a hazard that occurs time and again to all our fast going ocean steamers, several of which have been in imminent peril from the identical causes, and in the same place.—The Northern Passage is thronged with vessels, like a great highway, for the winds and currents in that latitude are most favorable to quick voyages. The rivalry of the great ocean steamers permits of no delay, even for safety; and passengers themselves would complain, of that Captain who should fall even a few hours behind the shortest possible time.

An error was committed in running from the propeller, for as it turns out, that vessel was saved mid night, by discharging cargo, have received on board the entire crew and passengers of the ill-fated Arctic. The boats of the latter were manifestly too few; and the crew, well knowing this, seized upon them at an early moment for the purpose of saving themselves, at the expense of the passengers. If subordination could have been maintained, the boats properly launched and manned, and then an efficient corps of men set to work energetically and coolly to construct rafts for the remaining persons on board, the entire number might have been saved. If a small body of determined men had been organized and armed, and with loaded guns, received directions to shoot dead the first man who disobeyed orders, the cowards who sacrificed others to save themselves, would have been restrained. Panic and disobedience were the causes of such a lamentable loss of life, for the steamer kept afloat four hours after the collision, quite time enough to have prepared them to meet more effectually, the final catastrophe.

Captain Luce was a brave man, and perhaps did as well as any other commander would have done under such trying circumstances.—He is deserving of immortal honor, that he stuck to his ship while a plank of her remained above the waves; and that he was saved, at last, is a Providential interposition in his favor, rather than the result of a predetermination on his part to preserve his own life.

The public are more to blame than the commander or the steamship company, for requiring a greater degree of speed than is consistent with safety. If a nine instead of a fifteen days voyage is required, those who call for it must incur the peril; and it is hoped that this last great and crowning calamity will open the eyes of the community to the folly and wickedness of such a course.

The wreck of the Arctic has taken from the community a large number of wealthy and distinguished men, and has carried mourning and distress into many a proud mansion. True, the individual cases are of no greater hardship than when an equal number of poor and nameless emigrants go down to an ocean grave, but the country at large is the greater sufferer. The effect, however, may be more powerful to apply a corrective to this reckless manner of ocean steaming, and thereby save hereafter a thousand lives for the sacrifice of each of the Arctic's shroudless passengers.

The Recent Lake Disaster.

The burning of the steamer E. K. Collins on Detroit River, mentioned last week, proves to have been a much more lamentable disaster than at first reported. A dispatch to the *Buffalo Commercial* says:

The Collins took fire on her boiler deck. So rapid was the spread of the flames that the passengers and crew, who had mostly retired, were unable to save anything except a few articles of clothing. She took fire in the Bay above Malden and nearly abreast of the light house. She was immediately headed for shore, but was unable to reach shallow water before the flames had complete possession of her. The after part of the boat swung round into the river, and nearly all on board were driven in that part of the boat and were obliged to jump into the river. The current here sets out very strongly into the lake, and had it not been for the timely arrival of the propeller Fairy, Capt. Langley, nearly all would have been inevitably drowned; seeing the light he hastened to the spot and had his boat all ready to let go as soon as the vicinity was reached. This was done and nearly all the saved were picked up by him, a few only reaching the shore. Some were nearly exhausted.—Everything that could be done to relieve the sufferers was done by the crew of the Fairy, who acted nobly.

Seven of the passengers and thirteen of the crew are missing and probably all lost. The remaining passengers, thirteen in number, were rescued as above stated. The Collins was nearly a new boat, having been built last year, and cost $105,000. She was owned by Capt. E. B. Ward, and insured for only $13,000.

Eleven Persons Drowned.—On the 13th inst, as a skiff ferry boat, having on board seventeen persons, was crossing the river from East to West Troy, it was upset and all but six of the party were drowned. They were mostly young men, in the employ of Messrs. Wheeler & Taylor, chair manufacturers, West Troy. The skiff was upset by the swell from a steam tow boat passing in. All the bodies have been recovered.

Loss of the Arctic.

The details of this heart rending casualty have come fully to hand during the past week, and present a tragedy so full of horrors that at the contemplation the whole head grows sick and the whole heart faint. We have no room in the columns of a weekly for the full narratives and statements of the individuals saved, which statements have crowded the dailies since the melancholy occurrence, but we will endeavor to give a brief summary of the most important facts.

In the first place, then, from the best sources of information, we would state that the total of the crew saved was 89; total of passengers and crew saved, 108; crew known to be in one of the missing boats with 1st officer Goulet, 13; total saved, or known to have left the ship, 131; total passengers on the Arctic, 226; do. crew, 175; total in all, 401; missing, 270. The boats missing would hold 160, and it is barely possible that something like that number may yet be heard from.

Since the above list was made out, news has come from Quebec that the bark Cambria, from Glasgow to Quebec, picked up, from pieces of the floating wreck, Capt. Luce, seven or eight passengers, and five of the crew of the ill-fated steamer.

The following is a portion of Capt. Luce's statement:

The Arctic sailed from Liverpool on Wednesday, the 20th of September, at 11 A. M., with 233 passengers, and about 150 of a crew.

Nothing of special note occurred during the passage until Wednesday the 27th, when at noon we were on the Banks, in latitude 46° 45 N. and lon. 52° W., steering west by compass. The weather had been foggy during the day generally, and a distance of a half to three-quarters of a mile could be seen, but at intervals of a few minutes a very dense fog followed, but being sufficiently clear to see one or two miles.

At noon I left the deck for the purpose of making out the position of the ship. In fifteen minutes I heard a cry of "Hard-a-starboard" from the officer of the deck. I rushed on deck and had just got out, when I felt a crash forward; at the same moment saw a steamer under the starboard bow, and the next moment she struck against our guards and passed astern.

The bows of the strange vessel seemed to be literally cut or crushed off for full ten feet, and seeing that she must probably sink in few minutes, and taking a hasty glance of our own ship, and believing we were comparatively uninjured, my first impulse was to endeavor to save those on board the sinking vessel. The boats were cleared, and the first officer and six men left with one boat, when it was found our own ship was leaking fearfully.

The engines were set to work, by instruction to put on the steam pumps, and the four deck pumps worked by passengers and the crew, and the ship headed for land, which I judged to be about 50 miles distant. I was compelled to leave my boat with the first officer and crew, to take care of themselves. Several ineffectual attempts were made to stop the leak, by getting sails over the bows, and finally finding the leak gaining upon us fast, after all our powerful efforts to keep her free, I resolved to get the boats ready, and as many ladies and children placed in them as possible. But no sooner had the attempt been made than the firemen and others rushed into them in spite of opposition.

Capt. Luce goes on to state how the principal portion of the crew, like a set of craven ruffians, as they were, and a portion of the male passengers, seized upon all the boats successively, and pushed off from the wreck, leaving the women and children and such of the men as could not and would not desert them.

About a quarter to 5 P. M., continues the Captain, the ship went down, carrying every soul on board with her. I soon found myself on the surface, and after a brief struggle with my own helpless child in my arms, again I found myself impelled downwards to a great depth, and before I reached the surface a second time I had nearly perished, and lost the hold of my child. As I struggled to the surface of the water, a most awful, heart-rending scene presented itself to my view. Over two hundred men, women and children, struggling together amidst pieces of wreck of every kind, calling on each other for help, and imploring God to help them! Such an appalling scene may God preserve me from again witnessing. I was in the act of trying to save my child, when a portion of the paddle-box came rushing up edgewise, just grazing my head, and falling its whole weight upon the head of my darling child! In another moment I beheld him lying lifeless in the water. I succeeded in getting upon the paddle-box in company with eleven others—one, however, soon left for another piece, finding it could not support so many.—Others remained till they were one by one relieved by death.

For two nights and one and a half days the piece of the wreck to which Capt. Luce clung floated about until all had perished but three; the survivors standing up to their knees in water at 45°, and momently expecting to share the fate of their companions, when they were discovered and rescued, as above stated, by the Cambria, which also saved several others from other portions of the wreck.

The vessel with which the Arctic came in collision was the screw steamer Vesta, from St. Pierre, bound for and belonging to Greenville, France, and was steering east, south-east, crossing the Arctic's course two points, with all sails set, and a strong wind in the west by south-west. Her anchor stock, about 7 by 4 inches square, was driven through the bows of the Arctic about 18 inches above the water line, and an immense hole had been made at the same time by the fluke of the anchor below the water line, raking fore and aft the plank, and finally bending the chains, leaving the stock remaining in and through the side of the Arctic, or it is not unlikely that, as so much of her bows had been crushed in, some of the heavy longitudinal pieces of iron running through the ship may have been driven through the Arctic's side.

Official notice has been given, that the rate of postage to Australia will be reduced to 33cts.

News Paragraphs.

☞ The Methodist Protestant contains a well written article by Judge Hopper, of Maryland, on camp meetings. The Judge expresses the opinion of himself and brethren, that for social enjoyment these meetings take the first rank; but their usefulness for religious improvement, and for the conversion of sinners, has become less and less for many years past.

☞ The N. Y. Shipping List states, as an illustration of the depressed condition of the carrying trade, that a merchant extensively engaged in the shipping business has just had a first class ship offered to him for a twelve months' voyage *gratis*—nothing being required by the owner but a guarantee that the vessel should be returned to him in as good condition as when she was taken.

☞ At the recent fair in Hartford, a tall, spindle shanked Yankee having procured a lot of last year's tickets to the fair, with some few of this year's, stationed himself at the top of the outside steps of the City Hall, and near the ticket office, and did a brisk business for a few minutes by disposing of his stock at "half price."

☞ A *regular* manufacture of Egyptian antiquities goes on at Birmingham. They are exported to the banks of the Nile, and sold at a profit by the Arabs to incautious travellers.—Malay Krisses are also manufactured, which are sold as the "genuine article," to the ordinary voyager, at Penang, Malacca, and Singapore.

☞ Samuel Jones, of Somerset county, Md., has made this year $1,800 from his farm of 70 acres. Amongst his receipts were $150 for rosewater, mint water, and peach water, and $200 from ice, strawberries, butter, milk, cream and soap. His wheat engendered $593; his corn $350, and his potatoes $200.

☞ An elephant at Holyhead, England, broke from a stable in the night, walked up one long flight of steps and down another into a wine cellar, broke several bottles of wine and drank their contents, and then lay down and went to sleep. He was found the next day, looking the picture of contentment.

☞ Thirty-one clerks were dismissed from the Land Office and other bureaus Oct. 2, the most of them because of the completion of the work on which they were engaged, but some of them, if we may believe their own report, on the allegation that they had joined the mysterious order of Know-Nothings.

☞ Quite an excitement was recently occasioned in Fredericton, N. B., by the marriage of a French girl to an Indian. Parental opposition was unable to subdue their love for each other, and the copper colored aboriginal bore off his lady love, attired in a full costume of Indian foggery in triumph.

☞ During the height of the yellow fever at Savannah, a standing order was sent by the Mayor to Macon, for five hundred loaves of bread per day, as a *business transaction*, but Macon supplied the bread, repudiated the *business transaction*, and utterly refused all payment.

☞ A Madrid correspondent, describing the the interest poorer classes take in a bull fight says I'm told a week or two ago a man actually run off his wife's hair, while she was asleep, and sold it, in order to raise money for the purpose of seeing the fight.

Missing Ships.—The list of wrecks and casualties at sea, registered at Lloyd's during the present year, since the 1st of last January, discloses a frightful catalogue of ships missing, and which are now given up as lost, having, it is supposed, foundered with all hands aboard. In all there appear to be no fewer than forty-eight, which do not include the losses of the Madagascar and the ill-fated City of Glasgow screw steamer, with which upwards of five hundred and eighty unhappy creatures were lost, nor the San Francisco, nor the Franklin, nor the Philadelphia, nor the Arctic, all first-class steamers. Of the forty-eight enumerated in Lloyd's list, a large number were vessels bound across the Atlantic, carrying many passengers. The remaining vessels were brigantines and schooners. Strange to say, not a vestige of any one of the unfortunate vessels has turned up, not a fragment has been discovered. *N. Y. Post.*

Ancient Imported Church.—The oldest church now existing in the United States, is one near Smithfield, Isle of Wight County, Virginia. It was built in the reign of Charles I., between the years 1630 and 1635. The brick, lime, and timber were imported from England. The timber is English oak, and was framed in England.—The structure is of brick, erected in the most substantial manner. The mortar has become so hardened that it will strike fire in collision with steel.

An Old Stager.—At the Worcester Cattle Show the citizens extemporized a cavalcade a mile long, containing 200 saddle horses, 55 spans, and 120 single horses in carriages. The Argus says that one of the horses was from Barre, and was forty-one years old, but looking as hale and hearty, and drawing as well as any present; his owner uses him every day, and considers him capable of as much work as any of his young horses, and good for at least ten years more active service.

The Census in Scotland has lately been taken, from which it appears that country is the most thoroughly compact body of Presbyterianism in the world. The approximation to religious unanimity is greater in Scotland than in any other country in the world. On the morning of the census, Sunday, there were in all 903,951 persons at church. Of these 520,000 were Presbyterians; 120,000 belonged to various other sects, amounting in all to about thirty.

Another Guano Island.—The English Admiralty have received a letter from a naval officer in the Pacific, dated August 1, 1854, reporting that he found three vessels under American colors at the uninhabited island of Aves, in latitude 15° 40' 40" north, and longitude 63° 36' west, and one day's sail from St. Croix, shipping guano, of which he reports there is about 200,000 tons on the island, and but slightly inferior to the Peruvian.

Mission to the Chinese.—The Pacific Recorder reports the progress of this enterprise in Sacramento. Mr. Shuck has purchased a lot in close proximity to the main Chinese quarter of the city, upon which a chapel is to be erected for their permanent use as a place of worship. It is his intention to visit the adjacent towns and deliver lectures upon China and the Chinese, to raise funds for the chapel.

News Brevities.

—— *Mon Diet* is the name of a new post office in Linn county, Iowa.

—— The New York Mirror says Schuyler, the Railroad Swindler, is "flourishing in Paris."

—— Statistics show that France manufactures 700,000,000 friction matches per day.

—— Lieut. J. D. Bulloch, of the Navy, now commanding the mail steamer Georgia, has resigned.

—— The amount of emigration from Virginia, this fall, to the North-Western States, is said to be very great.

—— The lumbermen on the Ottawa are curtailing their business in prospect of low prices and overstocked markets.

—— The decrease in the receipts for Canal tolls for the season, including the 3d week in September, was $212,017.

—— A new Post Office has been established at Darton, Green county, Wis., and James Harvey is appointed Postmaster.

—— A large number of emigrants have left South Wales for the Mormon settlements in this country.

—— The New York Assay office is now ready to receive deposits on the same terms as the Philadelphia mint.

—— Another man has died from the injuries received in the late riots in New Orleans, making the eighth victim.

—— The U. S. Arsenal and grounds at Rome, Oneida co., are to be sold at public auction on the 15th of Nov. next.

—— Telegraphic wires have been extended entirely across the Peninsula of Hindoostan, from Calcutta, a distance of 1,200 miles.

—— The Commercial Advertiser says that the total deaths by cholera, in Buffalo, during the four months ending Oct. 1st, were 445.

—— The Herald says the total cholera deaths in Cleveland during the months of July, August and September, numbered about 500.

—— The Gov. of Maryland, has issued a proclamation appointing the 23d of November next, as a day of public thanksgiving and prayer.

—— The census of Memphis, recently taken, exhibits that there are in that city 1,411 more males over 21 years of age than there are females.

—— A few days since a man crossed the Mississippi, at the town of Chester, Ill., by swimming, for the sake of saving 5 cents ferriage!

—— A deaf and dumb boy has been arrested in New York on suspicion of incendiarism, and sent to the Penitentiary for six months, under the vagrant act.

—— A Kansas party of emigrants, numbering nearly 176 persons, passed through Detroit on Friday of last week. Another party of 200 is soon to follow.

—— It is said that Pope Pius has written to Mr. Brownson, commending his devotion, obedience and piety, and bestowing upon him his apostolic benediction.

—— A resolute effort is now being made by the advocates of temperance in the Canadian Provinces for the enactment of a law to prohibit the sale of intoxicating drinks.

—— The average weight of the mails despatched from London every evening, is between fourteen and fifteen tons. The newspapers and the bags weigh 12 tons 5 cwt.

—— Mr. Bunyn has introduced, in the Canadian Legislature, a bill to restrain Sunday labor, which, among other things, forbids the opening of any post-office for business.

—— Rev. Henry Ward Beecher, Horace Greeley and P. T. Barnum, are announced as about to take the stump in favor of Clark and Raymond in the river counties.

—— It is said that the Spanish Minister at Washington positively denies that the Government of Spain has ever for a moment entertained a proposition to sell Cuba to the U. States.

—— E. R. Jewett and Dr. Foote, of Buffalo, retire from, and have disposed of their interest in, the Commercial Advertiser of that city, to T. S. Thomas, S. H. Lathrop, and J. B. Lathrop.

—— Greening and Spitzenburg apples sell at the Washington market, New York, at from $2 to $2,50 per barrel. Mercer potatoes from $3 to $3,25 per barrel, and June potatoes at $2,50.

—— At New York, on Saturday week, there were 38 steamers, 186 ships, 118 barks, 100 brigs, 382 schooners, besides a fleet of coal and lumbermen, etc., numbering some 300.

—— The *N. Y. Times* offers as a reason for not printing the speech delivered by John P. Hale before the State Fair, that it is the same one he spoke in Massachusetts a few years ago.

—— The New York Assay Office is now ready for receiving deposits on the same terms as the mint, giving bars or coin in exchange for all those received, as soon as the value is ascertained.

—— Ellis Buffington and William England, Cherokee Indians, recently met each other on Grand River, in the Cherokee Nation, and in a fight with pistols and bowie knives both were killed.

—— The English papers are severe upon the Sisters of Mercy at Ilford, who recently inflicted the punishment of describing the cross on the floor with the tongue, which is described as a most cruel chastisement.

—— A private letter from Laporte, Ind., says there seems to be no end to the wheat and corn crop of that vicinity—that it has not been injured by the drouth, and that they are sending eastward 60,000 bushels a day.

—— At the New York State Agricultural Fair in New York, Mr. Jesse Williams, of Rome, had two specimens of cheese, each weighing over five hundred pounds! They attracted great attention and notice.

—— A life size statue of Daniel Webster, has just been completed by Louis Verhaegan, which is to be presented to the Mercantile Library of St. Louis, by H. D. Bacon, of the firm of Page & Bacon, of that city.

—— A correspondent of the Traveler states that in front of a fine dwelling in Marlborough, Massachusetts, there are six majestic elms, which the owner keeps insured against injury from lightning or fire, in the sum of $500!

—— Commodore Perry, of the Japan squadron, will not return immediately with his squadron to this country, but will leave it on a visit to Holland, where his wife now is on a visit to her daughter, Mrs. Belmont.

—— The returns of the Prussian income-tax show that, in a population of nearly 17,000,000, there are only three persons enjoying a greater income than £36,000, while in England there are twenty-two persons whose yearly income exceeds £50,000.

Literary Notices.

MEMOIRES OF CELEBRATED CHARACTERS. By ALPHONSE DE LAMARTINE, author of "History of the Girondists," etc., etc. Two volumes. New York: Harper & Bros.

VERY readable volumes are these, from the pen of the poet, novelist and historian, LAMARTINE. Whatever may be said of their accuracy in the facts of biography, we must allow that the strongely grouped subjects are attractively treated. Nelson, Heloise, Columbus, Bernard de Palissy, Rooslam, Cicero, Socrates, Jacquard, Joan of Arc, Cromwell, Homer, Guttenburg, and Fenelon, are the personages brought before the reader, each occupying from forty to one hundred pages. Sold by DARROW & Bro., Main St.

EARLY WARDENS, and his Contemporaries. Sketched from Home Circles. By Wm. TURNER COGGESHALL. New York: Redfield, publisher.

WE like these sketches, and, indeed, have copied several of them in past volumes from the magazines in which they originally appeared. Most of them are brief and pointed tales, embracing a moral worth heeding, and the volume is one which will have a good influence upon its readers. Sold at DARROW'S.

RURAL PAPER IN MAINE.—We ob erve by the last "Gospel Banner," that Rev. W. A. DREW, for some years the able editor of that paper, has retired therefrom, and proposes to publish at Augusta, Maine, a weekly paper entitled "Drew's Rural Intelligencer." The paper will be a weekly, in quarto form, after the design of the RURAL NEW-YORKER, its columns devoted to Agriculture, Horticulture and Floriculture, as well as subjects Domestic, Social, Literary, &c.—designing to make a weekly visitor for the farm and the family circle. It will be furnished at $1,50 per year in advance. Mr. DREW is a veteran editor, a ready and entertaining writer, sound on the subjects on which it is proposed to treat, and will make for New England a model paper. He has our best wishes for his success.

Foreign Intelligence.

Arrival of the Union and Europa.

THE steamer Union from Havre on the 27th ult., arrived at New York, and the Europa from Liverpool the 30th, arrived at Halifax, both on the 11th instant.

THE SIEGE OF SEBASTOPOL.—It is confirmed that on the 13th Sept. Euphatera was occupied without opposition by 2,000 Turks, 1,000 French and 1,000 English troops. The Russian garrison, numbering 4000, surrendered at discretion. The advanced guard was under command of Prince Napoleon. On the 14th the main army landed unopposed, half-way between Euphatoria and Sebastopol, horses, artillery and munitions all safely. The Russians retired in good order as the allies landed.—Menschikoff, who had his head-quarters at Simferopol, immediately advanced to Burstuck, on the river Alma, where he awaits reinforcements, to give battle to the allies.

It was confidently stated on the Paris Bourse that on the 19th the allies and Russians met and a battle ensued. The French came first into action—the English soon came up, and the Russians retired with much loss. If true, this occurring on the 19th, could only have been skirmishing, not a battle between the main armies. The Russian Embassy at Vienna had received a dispatch dated the 22d, from the Crimea, but all that had transpired was, that it contained news unfavorable to the Russians.

A Russian courier who had been captured, stated that the whole Russian force was only 46,000.

Russian accounts of the 19th, say that General Canrobert had a fortified position at Euphatoria, and that the main body of the allies was on a small river north of a parallel with the river Alma. 30,000 Russians were posted at the latter point, but with insufficient artillery.

Admiral Lyon's squadron, with 100 transports, had left the Crimea to fetch the reserve.

THE DANUBE.—Lord Raglan had called for a division in Bessarabia, consequently the Turks were advancing to the Pruth.

The advance guards set out from Bucharest on the 17th, and Omar Pacha would follow on the 20th. Ibrail and Galatz will be the base of operations. Only two battalions will remain at Bucharest, and small detachments will remain at the various points on the left of the Danube.

THE BALTIC.—News of the bombardment of Revel was daily expected, but the English press considers it would be impolitic at this late season, in the absence of the French fleet. At last accounts the larger portion of the fleet was at Ledsund; but the British would shortly leave for Baro Sound or Margen. Admiral Plumridge's squadron was at Margen.

The Russian fleet at Helsingfors, consists of 9 ships, mounting 780 guns; at Cronstadt, 21 ships, mounting 1,688 guns, besides 6 steamers. They were striking their topmasts, and preparing for winter.

On the 19th, the French and English fleets separated, the French under Admiral Duchesne, returning home.

THE WHITE SEA.—Capt. Lyons officially announces to the British Admiralty, the destruction of the town of Kola, which he burned to the ground without losing a man.

THE SEA OF AZOF.—Four Anglo-French steamers will endeavor to force an entry into the Sea of Azof to capture Russian transports, which are now conveying reinforcements into the Crimea.

On the 13th, a Tuscan ship at Constantinople reported that an army of 30,000 was at Taganrog, ready to be conveyed in pontoons and gunboats to Yenikale or Kutla.

The Journal of Constantinople states that this force had put to sea, was overtaken by a tempest and 200 men drowned. This is considered doubtful.

ASIA.—The Turkish army occupies the camp abandoned by the Russians near Kars. Schamyl has effected a junction with his lieutenant, Daniel Day, and threatens an immediate attack on Fitlis. Daniel has had two engagements, both successful, against Gen. Wrengles.

A division of the Polish artillery had deserted to the Turks, bringing two guns.

GREAT BRITAIN.—Capt. McClure and the crews of his Polar expedition, had arrived at Cork.

FRANCE.—A new civic police for Paris is to be organized on the model of the London police.

Prince Poniatowski, the Tuscan minister at Paris, has resigned, and intends to become a naturalized French subject. He is a favorite of the Emperor, who will appoint him to high office.

SPAIN.—Renewed disturbances are feared at Madrid, but as yet there has been no open outbreak. Barcelona is more quiet. Mr. Soule is in Paris, on his way to Baden. The Times' correspondent again asserts that the Spanish authorities hold the proofs of Mr. Soule's connection with the recent Revolutionary attempts.

The government has removed all French refugees into the interior, beyond the Ebro. They will not be allowed to reside in Arragon, Catalonia, the Basque Provinces, or Madrid.

ITALY.—The Papal Government has just concluded a loan of four millions of crowns with the Rothschilds.

The cholera is committing great ravages at Messina. All the consuls, except the Bey's and the American, had fled the city.

RUSSIA.—Respecting political matters, the only remark is, that whatever may happen, the Czar will not give in.

There has been a new issue of paper money to the extent of six million roubles.

Via the Baltic, it is stated that the discontent of the Russian population is increasing, and even threatens to bring on a revolution.

CHINA.—The dates by the overland mail are Canton, Aug. 5, Shanghai, July 21, Amoy, July 29, and Singapore, Aug. 13.

Canton was in a state of siege. Business was entirely suspended, and the city would in a few days be in the hands of the insurgents. No tea was being brought to market.

Whampoa and "Fushman" were still held by the insurgents.

LIVERPOOL CORN MARKET, Sept. 29.—Breadstuffs had an upward tendency, enabling holders to establish an advance of 3d on wheat, 1s@1s 6d on flour, and 2s@2s 3d on corn. Western canal flour was quoted at 31s 6d. Arrivals of articles were small and stocks light.

Brown, Shipley & Co. quote Western canal flour at 31s@31s 6d; Philadelphia and Baltimore 32s 6d@33s; Ohio 31s@34s 6d; sour 29s @29s 6d. White wheat 9s 2d@11s; red 8s 2d @9s 2d. White and yellow corn 30s@30s 6d; and mixed 29s.

WAR IN EARNEST!

SEVASTOPOL TAKEN BY THE ALLIES!

12,000 Russians Killed, and 22,000 Taken Prisoners!

LOSS OF THE ALLIES, TEN THOUSAND!

THE Collins steamer Baltic arrived at New York on the 16th.

Eight hours after the Europa sailed came official news of the great battle at Alma River, in Crimea, on the 21st.

The allies stormed the Russian intrenchments after four hours' fighting.

The Anglo-French loss—2,800 killed and wounded. The Russians lost 6,000.

Private despatches supply the rest of the news, viz., that the Russians under Menschikoff rallied on the river Katkutha on the 23d, and again gave battle to the Allies.

They were again defeated, and driven to the entrenchments behind Sevastopol. Again rallied, and fought a third battle on the 24th, and were a third time defeated. They fled into Sevastopol, which was beleaguered by sea and land.

On the 25th Fort Constantine was invested by sea and land, and after an obstinate defense was carried by storm.

The Allies then bombarded the city and the fleet. Ten Russian ships were burned and sunk. The remaining forts were carried, one after the other. Eight hundred guns were silenced, and 22,000 prisoners taken. The Russian loss, in dead and disabled, is estimated at not less than 18,000, in Sevastopol alone.

Menschikoff, with the shattered remains of his force, retired into a position in the inner harbor, threatening to fire the town and blow up the remaining ships, unless the victors would grant him honorable capitulation. The allied Generals demanded his unconditional surrender, and in the name of humanity gave him six hours for consideration.

The latest despatch says "Menschikoff has surrendered!" The British and French flags wave over Sevastopol. The entrenched camp of the Russians, on the heights of the Alma, contained 50,000 men, and numerous artillery and cavalry. It was carried at the point of the bayonet, after four hours' fighting.

No general officer of the British was wounded. Marshal St. Arnaud and Lord Raglan commanded in person. Gen. Thomasson, French, is thought to be fatally wounded, and Gen. Canrobert was wounded in the shoulder.

Russian accounts do not conceal the facts of severe reverses in the Crimea, for their arms.

A second dispatch from Berlin of the 29th, says:

"The return of the French fleet on the Baltic had been countermanded, and a dispatch dated 2d, states that the fleet left that harbor to join Napier, in the Baltic."

Napier was before Revel on the 23d.

RUSSIANS IN THE PRINCIPALITIES.—BUCHAREST, Sept. 30.—It is again asserted that there are 30,000 Russians in the Dobrudscha, and Gen. Luders was constantly receiving reinforcements.

Omer Pacha was only waiting for St. Arnaud's order to attack Bessarabia. The arrangements by the Turkish army indicate the intention of a winter campaign.

The Russians are concentrated in the neighborhood of Ismail.

Details of the Sevastopol news were not expected by the British government before the 6th inst.

The St. Petersburg Journal publishes a decree forbidding the export of corn to Austria.

The Paris correspondent of the Independence Belge says it is rumored that a joint note has been sent by England and France to the Cabinet at Washington, requesting an explanation of the engagements entered into between the United States and Russia, especially with respect to the nature and conditions of an acquisition to be made by the United States, of Russian possessions in North America.

LIVERPOOL MARKETS.—Brown, Shipley and others report breadstuffs generally quiet, and a limited business at previous rates. Good Indian corn scarce and firm. A moderate business doing. Lard and tallow dull. Bacon—no improvement. Beef and Pork still quiet, waiting government contract announcement.

Money in Dead Letters.

A CORRESPONDENT of the Baltimore *Sun*, writes from Washington under date of Oct. 3, that:

"The operations of the Finance Bureau of the General Post Office Department for the current year, disclose the fact of a rapid increase in the business and importance of the dead letter office. In the first quarter of 1852 the number of dead letters found by the openers, which contained money, was 1,701—the amount, $811,238; second quarter, 1,736 letters, and $11,176; third quarter, 1,781 letters, and $11,869; fourth quarter, 1,842 letters, and $11,713.

"In the third quarter ended 31st March, 1851—two years afterward—the number of valuable dead letters reached 2,333, containing $14,401. The second quarter yielded 2,487 letters, and $14,325 in money. We have from the third quarter—ended September 30th last—2,35 letters, in which were found $14,088 in cash.—When it is recollected that these do not embrace the dead letters from foreign countries—which are all returned unopened—the progress of this branch of Governmental service is more apparent."

The same correspondent states that seven-eights of the lost money is safely returned to the legal owners.

MARINE DISASTERS.—During the recent gales, several vessels on the upper lakes were wrecked or disabled. The Chicago Journal of Tuesday week has a list of those that suffered, including the barque France, ashore on Lake Huron; Leander, in St. Clair river, leaking; brig U. R. Seymour, dismasted; Wm. Brown, lost sails and 500 bbls. of salt for Saginaw bay; barque Fame, wrecked on Lake Huron with a cargo of grain; schr. Citizen, lost 25,000 feet of black walnut lumber; Cambria, lost 15,000 staves; Sacramento, with 4,650 bushels of corn, towed into Erie, leaky; North Carolina, capsized off Erie, crew saved, with the exception—cargo, slaves.

A MINISTERIAL STRIKE.—Yesterday at Urbana the bell of the Presbyterian Church rang the second time—the congregation sat waiting and watching, but no minister came. After the lapse of about half an hour, a note was handed to one of the elders, who arose and read it to the congregation. It was from the minister, who said he would not preach for them any more till his salary was paid up.—*Columbus (O.) Fact, 9th.*

AMERICAN PEARL FISHERY.—The Scientific American states that a company has been formed in Wilmington, Del., for the purpose of pursuing pearl fishing in South America. The ship Emily Fanning has been purchased for the purpose, and diving bells and all other things are being prepared for the voyage.

☞ In the case of Jager, on trial for murder in New York, Wm. Harrison was challenged and excluded from the jury on the ground that he was an undertaker, and his occupation gave him too great a familiarity with death.

Marriages.

Thursday morning, Oct. 12th, in St. Paul's Church, by Rev. Mr. Van Rensselaer, HOBART F. ATKINSON, Esq., and Miss LOUISE, daughter of Hiram Sibley, Esq.

Deaths.

At Honeoye Falls, on the 29th of Sept., ROBERT CAIRNCROSS HINKLEY, aged 82 years and 7 days.

He was born at New Ross, County Wexford, Ireland, Sept. 19th, 1772. He came to America in 1821. As an intelligent and Christian man, he was respected and esteemed by all who knew his worth.—COM.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, Oct. 18, 1854.

A SET screw has been put on to the downward tendency of prices, and considerably changed the aspect of things within the week. Wheat has gone up to two dollars, and is selling for that to-day. Flour is quoted at $9. Barley has improved also, within the week, and now brings 90 to 95 cents. Oats, Corn and Hay unchanged.

Butter and Eggs both higher, the former bringing readily 18¾ to 20 cents per pound, and the latter 17 to 18 cents per dozen.

Rochester Wholesale Prices.

NEW YORK MARKET—Oct. 16.

FLOUR—Market without important change. Demand quite moderate. At the opening holders were disposed to insist upon better prices, but were compelled to give way and accept about the current prices of Saturday last.—Closed with little animation. Sales at $8@8,25 for com. to straight State; $8,25@8,37½ for choice to favorite do; $8,-37½@8,62½ com. to good Ohio and mixed brands Michigan; $8,50@8,62½ for extra Oswego; $8,62½@10,12½ extra Genesee. Included in sales are 600 brls. good com. State at $8,12½; 400 extra Oswego at $8,50. In Canadian more doing—market, however, without important change; sales at $7,75@8,12½.

GRAIN—In Wheat only a moderate business doing—demand good, however, and business much restricted by the limited supply. For prime white Canadian $1,60, in bond, is said to have been refused. Sales small parcels com. white Southern at $1,85; prime white Genesee held at $2,25. Rye in good supply—market heavy; sales at $1,12½, which is an outside price. We hear of no transactions in Barley. Corn market easier with large receipts. Holders exhibit a pretty strong desire to realize; sales at 79@80c for good to prime west mixed. Oats in request at 45@50 for State; 43@45 for western.

PROVISIONS—Pork continues heavy. A moderate home trade demand, and some speculative inquiry, but at low prices. Sales for immediate delivery at $12,25 mess, and $11,37 prime; 2,000 brls. for all January, 1,000 first fifteen days, and 2,000 in February, at seller's option.—At the close mess was offered freely at $12@50 for immediate delivery. Lard dull and lower; sales at 10@12½ ordinary to prime, including small parcels at 10½. Butter more active. Prime firmer. Sales at 16@18c Ohio; 19@22 ordinary to prime State; and Orange county 23@25c. Cheese dull and unchanged.

ALBANY MARKET—Oct. 16.

FLOUR—There is a fair business doing in Flour. The demand fair for the home trade, and some inquiry for the east. Sales at $8@8,50 for com. to good State, $8@9 for com. to good western, $8,75@9,50 for fancy Ohio, Mich. and State, and $9,50@10 for extra Genesee. Corn Meal is steady and saleable at $1,62@1,69 per 100 lbs.

GRAIN—In Wheat nothing was done this morning.—Corn market favors the buyer, with a fair supply and a good home demand. Sales western mixed, afloat, at 77c. In Barley an important advance in prices were realized on Saturday afternoon, when sales of good four-rowed were made at $1,21@1,22, and Canadian, the first shipment of the season, at $1,23, afloat at $1,21, ordinary two-rowed at $1,19, Jefferson county at $1,23, and good to prime four-rowed at $1,22, 1,22½, 1,23, and 1,25, the latter for a very choice sample. Oats are in less active request, and prices rather easier. Sales of State 42c, measure.

HOPS—Small sales of new at 38@40c.

BUFFALO MARKET—Oct. 16.

FLOUR—Market somewhat depressed and receipts since Saturday more free. Very little inquiry, except for retail lots, buyers holding back, and the only sales we note aggregate about 600 brls. at $8 for choice Michigan.

GRAIN—Wheat market quiet and receipts good. The only sale which reaches us is 3,000 bus. white Mich. on p.t. Corn quiet and market lower than on Saturday, with more disposition to sell on the part of holders. The receipts since Saturday are nearly 200,000 bus. Sales 18,000 bus. at 65½@66cts. Oats quiet. No sales.

NEW YORK CATTLE MARKET—Oct 9.

AT Washington Drove Yard—Offered to-day 2,252 Beef Cattle; during the week 2 795. Prices—Beeves range from 7½ to 10c per lb. Cows and Calves, $30 to $45,50—Veal Calves, 3 to 6c Sheep from $2@5,50; Lambs $1,50@4,75; Swine, 4½@5c.

At Browning's—At market, 650 Beef Cattle, 40 Cows and Calves, 100 Veals, 6,400 Sheep and Lambs. Prices—$6@9,50 per 100 lbs. for Beeves; Cows and Calves range at from $25 to $45. Veals sold at from 4@6½c per lb. Sheep range at from $1,50 to $7. Lambs $2,75 to $4,50.

Advertisements.

ADVERTISEMENTS inserted in the RURAL NEW-YORKER at 15 cents a line, each insertion,—*to be paid in advance.*—Brief advertisements preferred, and we do not wish to give any one more than four successive insertions. Our space is limited, and we wish to accommodate and benefit as many applicants as possible,—at the same time interesting our readers by presenting something new, weekly.

☞ The circulation of this paper is several thousand greater than that of *any other* published in this State, out of New York city,—and we believe it largely exceeds that of any other Agricultural or similar journal (monthly, semi-monthly or weekly,) in either America or Europe.

TO THE CHARITABLE.—The Managers of the "Home for the Friendless," would inform its friends throughout the city and adjacent country, that they have recently undertaken to furnish supplies for the Home, the inmates of which have heretofore been boarded by the Matron.

With the present high prices of provisions, any gifts, and especially articles of food, would be particularly acceptable. The "Home" is located on the corner of East Avenue and Alexander St. 248-tf

DONATION VISIT.—The friends of the ROCHESTER PROTESTANT ORPHAN ASYLUM, in the city and county, are invited by the Lady Managers of that Institution, to make a Donation Visit at the Asylum, on THURSDAY, October 26th, between the hours of 10 A. M. and 5 P. M. The house will be open for the inspection of visitors and the children assembled.

In consideration of the low state of the finances, as shown by the Treasurer's Report, and of the unusual expenses attending the maintenance of so large a family, it is earnestly hoped, that the friends of the orphan, from both city and country, will avail themselves of this opportunity to visit the Asylum,—bringing with them, in the way of clothing, provisions or money, whatever they can spare of their own abundance, for the support of the eighty or a hundred destitute children, whose only home is the Asylum, in aid of which this charity is solicited.

250 By order of the Board of Managers.

SUBURBAN RESIDENCE AND FARM FOR SALE.

THE GROVE FARM, adjoining the corporation line of Canandaigua, on the high ground northeast of the village, and within a mile of Market, R. R. Depots, Post Office, Schools, Churches, &c., is one of the most beautiful and desirable suburban residences in Western New York. It contains 163 acres of choice land, including about 25 acres of woodland,—a fine, well finished brick house, in the English Cottage style, a tenant house, three barns, sheds, granary, and other out-buildings, altogether erected at a cost of not less than $10,000. There is an Apple and Peach orchard, and a Kitchen garden well stocked with all kinds of small fruit, and a never-failing Spring capable of watering the whole Farm, which is nearly of a square form, having the public road on three sides of it, and the wood-land on the fourth side. There is a beautiful Grove of 4 acres, of second-growth timber, in front of the house, giving name to the Farm, and from which there is a fine view of the Lake and surrounding country.

The buildings and 50 acres may be purchased for $10,000, or the whole Farm for $100 per acre, with no more required down, or collaterally secured, than may be necessary to render the sale positive. The location is a most healthy and eligible one for either a farmer, or a business man who wishes to retire and yet possess access to the conveniences of town life and the best society.

For further particulars, apply to the subscriber on the premises, or address WM. R. MACAO,
250-3t Canandaigua, N. Y.

A RURAL RESIDENCE FOR SALE.

FOUR miles north of Geneva, N. Y., containing 10¾ acres of land, good buildings, 1½ acres of the best varieties of fruit, good water, &c. This is a good location for a Gardener or Physician, and will be sold or exchanged for an improved farm in Michigan, Illinois, or Wisconsin. Price, $1,600—$1,000 or $1,200 down; the balance may be arranged to suit the purchaser. For further particulars address the subscriber at Oaks Corners, Ontario Co., N. Y., (post-paid)
Phelps, Oct. 10, 1854. [250] DANIEL HIGBIE.

FARM FOR SALE.

SITUATED in the town of Portage, Liv. Co., N. Y., two miles south of Hunts Hollow, five miles from Nunda, and five miles from Portage Bridge, one mile from the N. Y. City & Buffalo R. R. Said farm contains 130 acres, 32 acres in woods,—principally oak, Chestnut, and Pine,—is well watered, and well fenced with flak and Chestnut rails; 32 acres of wheat on the ground. There are two comfortable houses, two barns, two carriage houses, three orchards of good grafted fruit, Peaches, Plums, Cherries, &c. It is well adapted to grain or grass. Price $45 per acre. For further particulars inquire of H. BEARDSLEY,
Hunts Hollow, Livingston Co., N. Y. 250 3t

CHEMICAL ANALYSIS.

J. BRYAN, Practical Chemist, 112 State St., Rochester, N. Y., is prepared to make *full and accurate* analysis of Minerals, Soils, Metals, Mineral Waters and Chemical Compounds, and articles suspected of adulteration and *Poisons*, either organic or inorganic, and in quantity or quality. It is necessary to send one or two ounces of a solid, and a pint or more of a fluid for examination. 241-12t

HOME PROTECTION.

TEMPEST Insurance Company, Capital $250,000, Organized December 24, 1852; Chartered March 1, 1853. Homes only insured by this Company. No one risk taken for more than $3,000.

Many distinguished persons have insured their homes, to the amount of $3,000 each, in this Company, among whom are EX-President VAN BUREN, Kinderhook; Ex-Governor SEWARD, Auburn.

AUBURN, May 16th, 1853.

To whom it may concern:—We are personally acquainted with many of the Officers and Directors of the Tempest Insurance Company, located at Meridian, Cayuga Co., N. Y. In our opinion they are among the most wealthy and substantial class of Farmers in this county.

J. N. STARIN.
ELMORE P. ROSS.
THOMAS Y. HOWE, Jr.

The above gentlemen will be recognized as the Cashier of Cayuga County Bank, Auburn; Postmaster, Auburn, and Ex-Member of Congress, Auburn, Cayuga County.

N. B.—The public are cautioned to bear in mind the name, (*Tempest,*) and not submit to an imposition daily practiced by two-by-four Mutual Co's.
234-1t T. R. TIMBY, Secretary.

EYE AND EAR INFIRMARY.

DR. WALKER, Oculist and Aurist, (from London, England,) may be consulted daily, and testimonials obtained at the office, 82 State St., Rochester, N. Y. 242-tf.

Poetical.

[Written for Moore's Rural New-Yorker.]

DON'T YOU THINK SO?

'Tis a pretty fairy show when the summer flowers blow,
And their fragrance loads the gale;
When the cricket pours his song through the summer evening long,
And the glancing fire-flies sail.

'Tis a pleasant thing to hear, when the moon is shining clear,
The bay of the deep-mouthed hound,
And the last birds lingering outr, and the frog's shrilly croak,
When the sweet wind whispers around.

'Tis a cosey place to lie, when the sun is riding high,
In the stout tree's trembling shade,
On a cool and mossy bed, with a pillow for your head,
Which the clustering roots have made.

Life is full of pretty sights—and her sounds are delights,
If our hearts will but listen, and hear—
'Tis a happy thing to be in a world so full of glee,
When the friends that we love best, are near.

Red Cottage, Sept., 1854. JULIE.

Rural Sketch Book.

THE YOUNG PHILOSOPHER:

A SKETCH FOR PARENTS.

BY SYLVANUS COBB, JR.

Mr. Solomon Winthrop was a plain old farmer—an austere, precise man, who did everything by established rules, and who could see no reason why people should grasp at things beyond what had been reached by their great-grandfathers. He had three children, two boys and a girl. There was Jeremiah, seventeen years old, Samuel, fifteen, and Fanny, thirteen.

It was a cold, winter's day. Samuel was in the kitchen reading a book, and so interested was he that he did not notice the entrance of his father. Jeremiah was engaged in ciphering out a sum which he had found in his arithmetic.

"Sam," said the farmer to his youngest boy, "have you worked out that sum yet?"

"No sir," returned the boy in a hesitating manner.

"Didn't I tell you to stick to your arithmetic till you had done it," uttered Mr. Winthrop in a severe tone.

Samuel hung down his head and looked troubled.

"Why haven't you done it?" continued the father.

"I can't do it, sir," tremblingly returned the boy.

"Can't do it? And why not? Look at Jerry, there, with his slate and arithmetic. He had ciphered further than you have long before he was as old as you are."

"Jerry was always fond of mathematical problems, sir, but I can't fasten my mind on them. They have no interest for me."

"That's because you don't try to feel any interest in your studies. What book is that you are reading?"

"It is a work on Philosophy, sir."

"A work on fiddle-sticks! Go put it away this instant, and then get your slate and don't let me see you away from your arithmetic again until you can work out these roots. Do you understand me?"

Samuel made no answer, but silently he put away his philosophy, and then got his slate and sat down again in the chimney corner.—His nether lip trembled, and his eyes were moistened, for he was unhappy. His father had been harsh towards him, and he felt that it was without just cause.

"Sam," said Jerry, as soon as the old man had gone, "I will do that sum for you."

"No, Jerry," returned the younger brother, but yet with a grateful look; that would be deceiving father. I will try to do the sum, tho' I fear I shall not succeed."

Samuel worked very hard, but all to no purpose. His mind was not on the subject before him. The roots and squares, the bases, hypothenuses and perpendiculars, though comparatively simple in themselves were to him a mingled mass of incomprehensible things, and the more he tried the more did he become perplexed and bothered. The truth was, his father did not understand him.

Samuel was a bright boy, and uncommonly intelligent for one of his age. Mr. Winthrop was a thorough mathematician—he never yet came across a problem he could not solve, and he desired that his boys should be like him, for he conceived that the acme of educational perfection lay in the power of conquering Euclid, and he often expressed his opinion that were Euclid living then, he could "give the old geometrician a hard tussle." He seemed to forget that different minds were made with different capacities, and that what one mind grasps with ease, another of equal power would fail to comprehend. Hence, because Jeremiah progressed rapidly in his mathematical studies and could already survey a piece of land of many angles, he imagined that, because Samuel made no progress at all in the same branch, he was idle and careless, and he treated him accordingly. He never candidly conversed with his younger son, with a view to ascertain the true bent of his mind, but he had his own standard of the power of all minds, and he pertinaciously adhered to it.

There was another thing that Mr. Winthrop could not see, and that was, that Samuel was continually pondering upon such profitable matters as interested him, and that he was scarcely ever idle, nor did his father see, either, that if he ever wished his boy to become a mathematician, he was pursuing the very course to prevent such a result. Instead of endeavoring to make the study interesting to the child, he was making it obnoxious.

The dinner hour came, and Samuel had not yet worked out the sum. His father was angry, and obliged the boy to go without his dinner, at the same time telling him that he was an idle, lazy child.

Poor Samuel left the kitchen and went up to his chamber, and there he sat and cried.—At length his mind seemed to pass from the wrong he had suffered at the hand of his parent and took another turn, and the grief sunk left his face. There was a large fire in the room below his chamber so that he was not very cold: and getting up he went to a small closet and from beneath a lot of old clothes, he dragged forth some long strips of wood and commenced whittling. It was not for mere pastime that he whittled, for he was fashioning some curious affair from those pieces of wood. He had bits of wire, little scraps of tin plate, pieces of twine, and some dozen small wheels that he made himself, and he seemed to be working to get them together after some peculiar fashion of his own.

Half the afternoon had thus passed away when his sister entered his chamber. She had her apron gathered up in her hand, and after closing the door softly behind her, she approached the spot where her brother sat.

"Here, Sammy—see, I have brought you up something to eat. I know you must be hungry."

As she spoke, she opened her apron and took out four cakes, and a piece of pie and cheese. The boy was hungry, and he hesitated not to avail himself of his sister's kind offer.—He kissed her as he took the cake, and thanked her.

"O, what a pretty thing is that you are making," uttered Fanny as she gazed upon the result of her brother's labors. "Won't you give it to me after it's done?"

"Not this one, sister," returned the boy with a smile; but as soon as I get time I will make one equally as pretty."

Fanny thanked her brother, and shortly afterwards left the room, and the boy resumed his work.

At the end of the week the various materials that had been subjected to Samuel's jack-knife and pincers had assumed form and comliness, and they were jointed and grooved together in a curious combination. The embryo philosopher set the machine—for it looked much like a machine—upon the floor and then stood off and gazed upon it. His eyes gleamed with a peculiar glow of satisfaction, and he looked proud and happy. While yet he stood and gazed upon the child of his labor, the door of his chamber opened and his father entered.

"What—are you not studying?" exclaimed Mr. Winthrop, as he noticed the boy standing idle in the middle of the floor.

Samuel trembled when he heard his father's voice, and he turned pale with fear.

"Hu, what is this?" said Mr. Winthrop, as he caught sight of the construction upon the floor. "This then is the secret of your idleness. Now I see how it is that you cannot master your studies. You spend your time in making play-houses and By pens. I'll see whether you'll learn to attend to your lessons or not. There!"

As the father uttered that simple interjection, he placed his foot upon the object of his displeasure. The boy uttered a quick cry, and sprang forward, but he was too late. The curious construction was crushed to atoms—the labor of long weeks was utterly gone! The lad gazed for a moment upon the mass of ruins, and then covering his face with his hands, he burst into tears.

"Ain't you ashamed?" said Mr. Winthrop, "a great boy like you to spend time on such clap-traps, and then cry about it because I choose that you should attend to your studies? Now go out to the barn and help Jerry shell corn."

The boy was too full of grief to make any explanation, and without a word he left his chamber; but for long days afterwards he was sad and down-hearted.

"Samuel," said Mr. Winthrop, one day after the spring had opened, "I have seen Mr. Young, and he is willing to take you as an apprentice. Jerry and I can get along on the farm, and I think the best thing you can do is to learn the blacksmith's trade. I have given up all hopes of ever making a surveyor of you and if you had a farm you would not know how to measure it and lay it out. Jerry now will soon be able to take my place as surveyor, and I have already made arrangements for having him sworn, and obtaining his commission.—But your trade is a good one, however, and I have no doubt you will be able to make a living at it."

Mr. Young was a blacksmith in a neighboring town, and he carried on quite an extensive business, and moreover, he had the reputation of being a fine man. Samuel was delighted with his father's proposal, and when he learned that Mr. Young also carried on quite a large machine shop he was in ecstacies. His trunk was packed,—a good supply of clothes having been provided; and after kissing his mother and sister, and shaking hands with his father and brother, he mounted the stage and set off for his new destination.

He found Mr. Young all that he could wish, and he went into his business with an assiduity that surprised his master. One evening, after Samuel Winthrop had been with his new master six months, the latter came into the shop one night after all the journeymen had quit work and gone home, and found the youth busily engaged in filing a piece of iron. There were quite a number of of pieces laying on the bench by his side, some of which were curiously rivited together and fixed with springs and slides, while others appeared not yet ready for their Destined use. Mr. Young ascertained what the young workman was up to, and he not only encouraged him in his undertaking, but he stood for half an hour and watched him at his work. The next day Samuel Winthrop was removed from the blacksmith's shop to the machine shop.

Samuel often visited his parents and at the end of two years his father was not a little surprised when Mr. Young informed him that Samuel was the most useful hand he had.

Time flew by fast. Samuel was twenty-one. Jeremiah had been free two years, and he was one of the most accurate and trustworthy surveyors in the country. Mr. Winthrop looked upon his eldest son with pride, and often expressed a wish that the other son could have been like him. Samuel had come home to visit his parents, and Mr. Young had come with him.

"Mr. Young," said Mr. Winthrop, after the tea things had been cleared away, "that is a fine factory they have erected in your town."

"Yes," returned Mr. Young, "there are three of them and they are doing a heavy business."

"I understand they have an extensive machine shop connected with the factories. Now if my boy Sam is as good a workman as you say he is, perhaps he might get a first rate situation there."

Mr. Young looked at Samuel and smiled.

"By the way," continued the old farmer, "what is all this noise I hear and see in the newspapers about those patent Winthrop Looms. They tell me they go ahead of anything that was ever got up before."

"You must ask you son about that," returned Mr Young. "That is some of Samuel's business."

"Eh? What? My son? Some of Sam—" The old man stopped short and gazed at his son. He was bewildered. It could not be that his son—his idle son—was the inventor of the great power loom that had taken all the manufacturers by surprise.

"What do you mean?" he at length asked.

"It is simply this, father, that this loom is mine," returned Samuel, with a look of conscious pride. "I invented it, and have taken a patent right, and I have already been offered ten thousand dollars for the right of patent in two adjoining States. Don't you remember that *clap-trap* that you crushed with your foot six years ago?"

"Yes," answered the old man, whose eyes were bent to the floor, and over whose mind a new light seemed to be breaking.

"Well," continued Samuel, "that was almost a pattern of the very loom I have set up in the factories, though, of course, I have made much alteration and improvement, and there is room for improvement yet."

"And that was what you were studying when you used to stand and see me weave, and when you used to fumble about my loom so much," said Mrs. Winthrop.

"You are right, mother. Even then I had conceived the idea I have since carried out."

"And that is why you couldn't understand my mathematical problems," uttered Mr. Winthrop, as he started from his chair and took the youth by the hand. "Samuel, my son, forgive me for the harshness I have used towards you. I have been blind, foolishly so, and now see how I misunderstood you. While I thought you were idle and careless, you were solving a philosophical problem that I never could have comprehended. Forgive me, Samuel—I meant well enough, but I lacked judgment and discrimination."

Of course the old man had long before been forgiven for his harshness, and his mind was open to a new lesson in human nature. It was simply this:

Different minds have different capacities, and no mind can be *driven* to love that for which it has no taste. First, seek to understand the natural abilities and dispositions of children, and then in your management of their education for after life, govern yourselves accordingly. George Combe, the greatest moral philosopher of his day, could hardly reckon in simple addition, and Colburn the mathematician could not write out a common place address!

EARLY CHARACTER.

"*There is nothing I despise so much as to see a boy with a cigar in his mouth.*" Thus remarked one of the wealthy and most respected business men of East Boston, standing at the door of the Post Office waiting for the distribution of letters, as a boy walked in, puffing a cigar. Sympathising somewhat with the gentleman, we fell into the following reflections:

We imagined that in the course of human events, this boy might be induced to apply at the gentleman's counting room for employment. The merchant's remembrance of his act of youthful dissipation would probably not be to the benefit of the applicant. The merchant would be likely to judge unfavorably of the young man's character as to temperance and sobriety, and would think himself justified in doubting the independence and stamina of one who, evidently for no better reason than because others do, and probably because he thought it would give him a manly air, contracted the offensive and unnatural habit of smoking in boyhood. The very act would seem to argue mental or moral deficiency, and perhaps both. Little things are sometimes attended with great results. The merchant (like a majority of well-bred people) is exceedingly annoyed with the smell of cigar smoke. He despises the practice of smoking, and cannot help noticing the boy who exhibits it, or thinking, in such case, what the mental manifestation is. With the boy, the act was a trifle, nothing. To the man it was a revelation which told him something of a youth of whom he knew nothing before, and that something was to his discredit.

How different would have been the result, if the first act of this boy noticed by the merchant had been one that as plainly spoke of integrity and good sense, as the act of smoking did of weakness and frivolity of character.—The man would have remarked that boy; and if it should ever have come in his way to render him a service, no testimonials would be needed to secure his favor.

We would fain impress upon the young the great importance of forming good habits. One *may* forsake his boyhood's errors when he becomes a man; but the chance is that, instead of being forsaken they will be aggravated, and take on a rigidity which is like second nature to the individual, as he advances into manhood. Knowing this, people judge of young men by what they knew of them when boys,—unless a subsequent acquaintance gives them better ground for the formation of an opinion.—*East Boston Ledger.*

Youth's Corner.

ILLUSTRATED REBUS, NO. 43.

☞ Answer in two weeks.

[Written for the Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 11 letters.
My 1, 2, 9, 2 is sharp.
My 2, 9, 4, 8 is fresh information.
My 3, 2, 10, 7 is singly.
My 4, 9, 8, 5 is a point of compass.
My 5, 3, 2, 9 is a particular sound.
My 6, 3, 4, 10 is a mournful sound.
My 7, 9, 10, 1 is found in an egg.
My 8, 5, 9, 4 is to boil slowly.
My 9, 10, 8, 9 is something besides.
My 10, 3, 2, 9 is solitary.
My 11, 10, 3, 4 is to issue.
My whole is a lesson which all should learn.

Rond, N. Y., 1854. O. H.

CHARADE.

My first is of most ancient date,
My second all in day;
My first my second rules, and bids
It come, and pass away.

Yet so that when my first is not,
My second cannot be;
My second is both long and short,
And in my first's degree.

My first although it never stirs,
Seems ever in a race;
Rises, perhaps, but never sits—
My second runs apace.

My first had never feet; but once,
'Tis said, was known to stand;
And by that act, my second won,
Brought blessings on the land.

My whole is a most precious thing,
Yet often vilely spent,—
And e'en though thrown away, returns
To give your heart content.

[*Blackwood's Mag.*

Answer to Illustrated Rebus No. 41.—*Herding Cattle answers in a measure, but a barn succeeds better.*

Answer to Miscellaneous Enigma in No. 41.—*Experience keeps a dear school, but fools will learn in no other.*

Answer to Charade in No. 41:

Two letters, *H* and *E*, denote
The man as plainly as his coat;
Five letters show him by his *Heart*,
And their three last his will to *Art*.

Your five last letters *Earth* we find,
Which doth the sea in letters bind,
Then add the letter H to Earth,
And you are quite at home in *Hearth*.

And *Hearth* implies a grate above,
To warm your friendship and your love.
And keep both from that "coldness baleful,"
Giving a grate to make you grateful;
And thus your riddle I unfold,
In all six letters truly told.

Wit and Humor.

Traveler:—"Hi say, sir, ham I on the right road to 'Artford?" Jonathan: "Well you ham." Traveler: "'Ow far shall I 'ave to go before I get there? Jonathan: "Well, if yeou turn reound and go 'tother way, may be yeou have to travel abeout ten mile. But if you keep on the way yeou are going, you'll have to go abeout eight theousand, I reckon."

"How are you, count?" said a noted wag to a spruce looking specimen of a genus snob at the railroad depot, last week. "Sir!" exclaimed the indignant swell, "who are you, and why do you call me count?" "Why, I saw you counting oysters in New York, last week, and I supposed you were of royal blood," returned the wag.

The best cough mixture that has yet been made, consists of a pair of thick boots, mixed with lots of air and plenty of exercise. People who hog the stove and grow lean, will please notice.

A lazy fellow out west spells Tennessee in this way—10 a c.

The man who pledged his word and honor has lost his ticket.

STARR'S PREMIUM PIANO FORTES.

Every person in this vicinity, desirous to purchase a Piano Forte, will be *more than paid* by visiting my rooms, where he can *buy directly from the manufacturer*, save the considerable sum in an agent, and select from the largest assortment in Western New York, or I have constantly on hand from 15 to 30 finished instruments, and from 50 to 100 others in process of construction, of various sizes, patterns, and prices, from $230 to $700 each. They embrace such a combination of excellencies, in their beauty, solidity, strength, (to keep in tune,) exquisite touch—soft, deep, rich, full and melodious tones—as induces the belief, so often expressed by those who have bought, or used them, that "they surpass all others in the market." Their superiority was acknowledged when one of the most intelligent musical committees which ever acted on a similar occasion, *awarded us the three highest premiums*, when in competition with Chickering, Gilbert, Bacon & Raven, Wm. Hall & Sons, at the New York State Fair for 1851.—And the number since sold, with their daily *increasing celebrity*, fully justifies the report of that committee. They are manufactured of the best materials, in the most perfect manner, with metallic plates upon the 180 Chordal scale, with the last Improvements, and French Grand Action, *expressly for retailing*—(numerous applications at wholesale, being constantly refused,) and can only be had at my rooms, where the instruments will be shown, and all orders promptly attended to. As it is fully realized that *a good Piano is cheap at almost any price*, and a poor one only a nuisance; and as I rely alone upon their merits to secure them favor with the public, I invite for them, the most careful examination and scrutiny, by all who wish to buy at my manufactory and show rooms, Nos. 45, 47, 49 & 51 Orphean Buildings, Main st., 3d Floor. Every instrument will have upon it the name of the subscriber, and be *warranted to please the purchaser*.

Rochester, June, 1854. FREDERICK STARR.

KEDZIE'S RAIN WATER FILTERS.
MANUFACTURED BY
J. E. Cheney & Co., Rochester, N. Y.

The use of water impregnated with lime and other mineral substances, in the opinion of all medical men, is one of the chief exciting causes of many diseases incident to the varied climate of this country.

These Filters have been fully tested, for many years, by hundreds of families in this city and in various parts of the country, and have in all cases given the highest satisfaction.

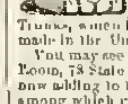
Rain water, of whatever color, taste, or smell, by this means becomes as clear as crystal. 295-1amif

FARMERS' AGENCY.

Being a Practical Farmer, and having considerable experience in the selection and use of Farm Implements, and having in the vicinity of extensive Seed and Implement Stores and Agricultural Implement Manufactories, and also the Nurseries of the choicest fruit and ornamental trees and knowing the difficulties that farmers have to contend with in the selection of these in the hurried seasons of the year, I will select, purchase and carefully forward anything in the above line for a small compensation. Satisfactory reference given in all cases when required, and the money promptly returned in all cases where the wishes of the sender cannot be complied with. 232-1om-tf

Address L. A. CLARK, Marion, Wayne Co., N. Y.

TRUNKS AND VALISES.



The subscriber would inform the citizens of Rochester and the public generally, that he is manufacturing extensively, a very superior article of sole leather and steel spring Trunks, which he will guarantee to be equal to anything made in the United States.

You may see at PRITCHARD'S Trunk Depot and Sales Room, 78 State street, 1000 Trunks and Valises, and he is now adding to his large stock from 125 to 150 per week—among which you may find Trunks varying from one dollar to fifty. If you should want anything in his line, give him a call, for his motto is, "Large sales and small profits."

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

The Wool Grower and Stock Register is the only American journal devoted to the important and profitable branches of *Wool and Stock Husbandry*. It contains a real amount of *useful* and *reliable* information on the above and kindred subjects, and should be in the hands of every owner or breeder of Sheep, Cattle, Horses, Swine, or Poultry—whether located East or West, North or South, for the most of the matter given in its pages is equally adapted to all sections of the Union, the Canadas, &c. The Sixth Volume, commencing July, 1854, will be

Enlarged to 32 Octavo Pages Monthly!

And improved in both Contents and Appearance. Among other matters of interest to Wool Growers, Breeders, Graziers, Dairymen, &c., the new volume will contain Pedigrees of Pure-Bred Cattle, Horses, Sheep, etc., and the Names and Residences of the principal Breeders and Owners of Improved Stock throughout the country. It is published in the NEAT STYLE, and ILLUSTRATED WITH MANY ENGRAVINGS—including Portraits of Domestic Animals, Designs of Farm Buildings, &c., &c. The careful REVIEWS OF THE WOOL AND CATTLE MARKETS, given in each number, are alone worth many times the price of the paper.—To Wool Growers this feature is invaluable.

TERMS—Only Fifty Cents a Year;

Five Copies for $2; Eight for $3,—*in advance*. Any additional number at 37½ cents per copy. Club papers will be sent to different post-offices, if desired. ☞ Back volumes (well bound in paper, for mailing) furnished at above rates.

☞ Now is THE TIME TO SUBSCRIBE and form Clubs. Money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

☞ Mr. C. Moore, of Gerry, Chau. Co., is authorized to act as Agent for the RURAL NEW-YORKER, and for the WOOL GROWER AND STOCK REGISTER, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,
IS PUBLISHED EVERY SATURDAY,
BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance*. The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

Progress and Improvement.

FARMERS' CLUBS.

The leisure season of the farmer, if he may be said to have such a time, will soon be here, and we again recur to the subject of neighborhood agricultural associations, or Farmers' Clubs, because the topic is seasonable, and that we believe it one of importance to every rural community. Another year, with its results and its varied experiences, is now before the cultivators of farm and garden, and many a fact of practical value has been learned during that period. Different individuals, however, seem to turn over different leaves in the great volume of Nature, each reading a special lesson of her operations; hence, from the comparison of these experiences, much valuable knowledge may be added to the general as well as individual stock of information. This is the great object of the Farmers' Club, the formation of which we have, from time to time, attempted to advocate, we fear, however, with but small success.

Now, or at least as soon as the fall elections are past, is the time to organize these social meetings,—well-described in the designation above given, as Farmers' Clubs. Let the people of any rural neighborhood—(including, perhaps, the territory of two or three school districts.)—interested in the cultivation of the soil, meet, either at the school house, or the residence of one of their number, appoint a few officers and agree upon a few simple rules for the regulation of their weekly or semi-monthly sessions, choosing also a subject which shall be discussed at their next meeting, or upon which some of their members shall be requested to prepare and read essays, and you have a Farmers' Club started. No difficulty will be found in the selection of themes, both interesting and profitable, in the cultivation of different crops, the best breeds and management of stock, &c., &c., for there are numberless questions brought daily before every farmer in which he is interested pecuniarily, and should be mentally, and which may be made profitable subjects of discussion. Here will be brought into use the experience of the past, and each may impart to the whole whatever he has learned, not generally known, or which may tend to confirm or confute the generally received opinions.

It may be thought best that each member pay a certain amount as an initiation fee, to be applied to the purchase of agricultural books and periodicals, for the use of the Club, and in this way, at a small expense to each, a large amount of reading could be secured to the whole. The many valuable papers now published would thus be brought before a wider circle of readers, and exert a still more powerful influence for agricultural and horticultural improvement. Many valuable books could thus be consulted by multitudes who would not be able otherwise to avail themselves of the privilege.

But the great object of these Clubs, as we have said before, is the cultivation of the social faculties by the union of those of like interests for their mutual advantage and improvement. There is no class or profession which makes less use of this principle of association than the farming, and none to which it can be of so much practical benefit. The knowledge of the best methods of cultivation, and all agricultural information, is derived mainly from experience, and new facts are constantly coming before the eyes of every intelligent and observing farmer. These facts are of just as great value to his neighbor as himself, and the neighbor on the other hand, may have learned something of equal interest. The interchange of the results of observation and experiment is what gives agricultural papers their value, and these societies, though in a narrower range, all tend to the same end. The results of the experience of the individual farmers of a neighborhood may be made general property to the advantage of the whole, as the experience of the best farmers of the country is made the general property of its readers, and a furtherance to the public interest, by publication in an agricultural journal. So also are farmers socially united, as they find mutual profit from such interchange of information and courtesy.

We think it will always be found profitable to have the subjects of discussion known beforehand, as the members will come better prepared to give brief statements of their knowledge of the matter, though the remarks at the time will very likely call out facts not particularly thought of previously, but none the less valuable on that account. And there are few if any neighborhoods where there are not several persons well qualified to prepare essays on subjects of interest, presenting in a condensed form the results of experimental and scientific research thereupon. And the existence of a Farmers' Club will incite to the trial of new experiments on doubtful questions in farming economy, and more careful observation of the varied operations and phenomena of Nature.

A more extended public interest may be given by occasional lectures by competent persons from abroad, by gatherings more exclusively social in which the ladies take a larger share; and experience will suggest many ways to give lively interest and large usefulness to the Farmers' Club, making it one of the most important agencies in improving the minds and farms of every neighborhood in which they go into operation. Such, indeed, has already been their effect in many instances, and we hope they will become more numerous and more useful until every farmer is awake to the importance, and active in the dissemination, of the knowledge which tends to Progress and Improvement in Agriculture.—R.

SCIENTIFIC AGRICULTURE.

There is at the present time, among the rural population, a great desire for scientific information in regard to everything pertaining to the arts of agriculture and horticulture. One evidence of this is found in the increased demand for popular scientific works. And as demand generally creates a supply of some kind, every few months brings us a new book on scientific agriculture. It is not long since that an excellent little treatise, "Stockhart's Chemical field Lectures," was issued from our teeming press, followed by Nash's "Progressive Farmer," and shortly afterwards by a new edition of "Johnston's Elements of Agricultural Chemistry and Geology," and a few weeks since, by "Waring's Elements of Agriculture," and the other day brought us a neat little work by Dr. Kent, of Philadelphia, called "First lessons in Chemistry and Geology, as applied to Agriculture." Every new book should be an improvement on its predecessors, but we are sorry to say that the reverse appears to be the case.

Opening Dr. Kent's book we read:—"It is more advantageous for the pupil, and no more troublesome for the instructor, to teach the elements of science scientifically and correctly, than to convey his instructions in language unscientific and often inappropriate." With this we were pleased, and continued to read, expecting to find a very correctly written, scientific treatise. But we had not gone far before we read:—"Common salt is a combination of *soda* and *muriatic acid*, the acid commonly known as spirits of salt." We need hardly inform our readers that common salt is formed of chlorine and sodium, and, when pure, contains not a particle of muriatic acid or soda. Considering it as muriatic acid and soda, we are not surprised to find him recommending common salt to be mixed with lime for the purpose of converting it into carbonate of soda and chloride of lime. Errors are seldom found single.

Ammonia is spoken of as "a very important article in the composition of manures," and further:—"Quick lime should never be mixed with guano or other manures containing ammonia; because the lime sets the ammonia free, and allows it to escape into the atmosphere." This is all very true. But speaking of wood ashes, which "contain potash, a combination of oxygen with potassium," he says: "mixed with rape-dust, guano, and other manures, they make a very useful compost." He forgets to add that potash will drive off the ammonia just as rapidly as the lime. If one is injurious the other is certainly no less so. In another place it is recommended to accelerate the decomposition of cow dung "by the addition of wood ashes or quick lime, well turned with the heap, whereby the process of decomposition is greatly hastened, and the *manure much improved.*" Is it not amusing to find in the recommendations of such a work, and which are published with it, school-teachers, professors, and editors, prating about "stupid, bungling agriculture," and "the pursuit of agriculture so *ignorantly* and bunglingly followed by the great mass of our farmers?"

"The flesh of dead horses, diseased cows, hogs and dogs, when decomposed, makes a very valuable manure." * * "They should be decomposed by the action of oil of vitriol."—This recommendation is simply absurd. Oil of vitriol is about the best thing that can be used to *prevent* decomposition. If oil of vitriol cannot be obtained, "lime may be advantageously added to the substances to undergo decomposition, *whereby all the gases disengaged during the process are absorbed and retained for use.*" Oh! you "stupid, bungling" farmers, think of the wonders of chemistry; lime will *drive off* all the ammonia from "guano and other manures," but it will "improve" cow dung and *absorb* and *retain* the ammonia of dead horses and *diseased* cows.

"If the *amount* of manure to be made is the object of the farmer's efforts, then his stock should be kept in a *cooler* and *less sheltered* locality, and where they can take *abundant exercise.*" Well, we farmers *are* a "bungling, stupid" set of fellows, after all. We have been building barns and warm sheds for cattle and sheep in winter, "ignorantly" supposing that warmth was to some extent an equivalent of food, and also that an animal kept in a mild temperature, without much exercise, would give *more manure* for the food consumed, than one kept in a cooler and less sheltered locality with abundant exercise.

"A horse can be kept in a *perfectly good condition* if he can obtain as food fifteen lbs. of hay and four and a half lbs. of oats, daily." This statement is thrown out just as we give it, without any qualifying considerations. Boussingault, who probably made more experiments in feeding horses than any other man, found that his horses required per day 22 lbs. hay, 5½ straw, and 7½ oats. The horses weighed about 1,000 lbs each. Of course smaller horses would require less food, but we are satisfied that on the average the estimate of Dr. Kent is much too low.

"If you want to ascertain whether a soil or substance *contains lime*, you may pour upon a small quantity of it, vinegar or dilute muriatic acid. If *lime is present* the mixture will froth up, or effervese."

This is a very simple "test for lime," and we believe was first recommended by Sir Humphrey Davy. When it first appeared, our English friend and correspondent, John Hilditch, Esq., had three large fields ready for wheat sowing. He took samples from the three fields, and on pouring on the muriatic acid he found that two of them effervesced, and the other did not. He repeated the test, with the same result. Now, said he, Sir Humphrey says this soil contains no lime, and that it will not produce wheat without liming. But as there is no time to lime it before sowing, what shall I do? He concluded to risk the seed, and if the wheat would not grow, to sow the field to turnips the next spring. The three fields were sown. The wheat came up on all three, grew, and did well. But the field which would not effervesce, and which, therefore, did not contain lime, and consequently would not grow wheat, produced the best crop of wheat of the three, averaging, if we recollect right, *upwards of fifty bushels per acre.* The fact is, this test for lime is a most uncertain one, and it is surprising that any one, at the present day, would publish it for the guidance of the "stupid" farmer.

"Now, you will see that unless the soil contains all the substances found in the ashes of plants, the plants cannot grow *perfectly.*"—And again: "If a soil was wholly destitute of one of these substances, it could not yield *good* crops." If the soil did not contain all the ash constituents of plants, no plant could grow at all, "perfectly" or imperfectly. And if one of these substances were missing, neither a "good crop" nor a bad one would be obtained. So, at least, believes one "bungling" farmer.

NOTES FROM MY CORRESPONDENCE—NO. VI.

Mr. I. W. Briggs, of West Macedon, N. Y., who has experimented with both the Japan and Oregon Peas, thus speaks of his success with them:

"I have a fine crop of the Japan Pea on a second trial, and find it to be very prolific—my plants averaging 300 pods each. I find they require a long season, or at least the whole of ours, in which to mature their seed. They should be planted in hills or drills and cultivated like Indian corn. Two quarts of seed is enough for an acre, the yield of which I estimate at 60 bushels. The plant much resembles the Oregon Pea, which I have also been testing and trying to mature. But the best I could do was to bring it to the point of opening its flowers when our first killing frost struck it, on the night of the 29th and 30th September. Thus has ended my experiment with the Oregon Pea. I think, however, all that can be said of the good qualities of the Oregon Pea may be equally applied to the Japan Pea. Like the former, it is a very branching plant and attains about the same height, while its fruit is three or four times larger, and *it will mature in our climate.*"

Mr. B.'s experience with these Peas is corroborated by our own. We have also tested the Japan for two seasons, and find that it matures its seed more fully this season than it did last. We have no doubt but it will in a few years become so acclimated as to ripen without any difficulty. It has a more robust form and foliage than the Oregon, and if the latter is a great ameliorator of the soil, the Japan must be equally so, if not superior, for it also belongs to the leguminous family of plants, where are found our clovers and common peas. Its vigor against drouth would seem to indicate that it might be just the thing to help renovate those light soils where clover is found to be so difficult to catch and grow.

Vermont must be some for squashes, or Mr. John McKee, of Bristol, who wrote us Sept. 11th, must have a rare faculty of bringing out the fertility of his soil. He says: "I have squashes growing in my garden that I believe will beat anything in Old Vermont. From the planting of two seeds, I have six squashes that will weigh 1000 pounds. This may seem a 'whopper' to you, but it is nevertheless true. The largest one measures seven feet and ten inches in circumference and the smallest six feet four inches. In shape they are round, and smooth like glass. I think these are larger than the one from which my seeds were taken, and that weighed 202 lbs." Not much wonder Mr. McKee can raise melons that weigh 30 lbs. He speaks of having turnips, from a sample of seed sent him by the writer, that measured at the date of his letter 20 inches in circumference. These are the Sweet French Turnip, spoken of on page 101, No. 13, of the present volume.

Mr. J. B. Garber, of Columbia, Pa., sent us, under date of Aug. 11, seeds from a seedling grape he has growing, and of which he says: "The grape seeds I enclose, are from a seedling which I raised from seed received from North Carolina. It is very hardy, thrifty, and a great bearer: in size, color and quality about like the Isabella, but is at least four weeks earlier. Though not fully ripe at the present date, (Aug. 11,) it is full colored, while the Isabella is as green as grass."

Mr. Garber thus speaks of the Hoo Sung, a plant that ought to be more generally known: "This is a plant of the lettuce family, and originally from China. Some six or seven years since it was highly lauded by Mr. Kenrick, of Ill., and H. Wendell, of Albany, N. Y., as a substitute for asparagus. I received seed from the former gentleman, and have had it in cultivation since, but never knew its full value till this season. By cutting the stems when growing and previous to flowering, and cooking like asparagus, it is fully as delicious as that 'world-wide' celebrated vegetable; while on the ground that would give you a dozen dishes of asparagus in a season, and after having labored and waited for two or three years, you may take a hundred of the Hoo Sung in three or four weeks."

Mr. H. B. Mackathlin, of Kingston, Mass., speaking of fertilizers, in a recent letter, adds: "I laid down some land last fall to grass, trying different kinds of fertilizers. Among them all, bones, dissolved in oil of vitriol and applied at the rate of twenty bushels to the acre, with a sprinkling of unleached ashes, produced the most marked effect. The growth was so great, the grass had to be mowed very early, and then it covered the ground almost too thick to cure. For potatoes, on my sandy fields, I find a large spoonful to each hill of a mixture of three parts of plaster of Paris to one of guano, very effective. I also find, when well pulverized with frost, swamp muck, mixed with hen manure at the rate of 100 bushels of the former to five of the latter, or two of guano, very good for potatoes in sandy land, when applied at the rate of a shovel full to each hill." T. E. W.

VALUE OF CARROTS FOR MILCH COWS.

Messrs. Eds:—I have tried feeding carrots to milch cows, and will give you one of my experiments. I have, (April 15th,) seven cows in milk—one calved in June, the rest in Sept. and Oct. I raised 80 bushels rutabagas and 400 bushels carrots, and fed them to my cows, commencing the first of December. I gave them about 2½ bushels per day, at noon, the rutabagas first, and when they were all fed out the same quantity of carrots. I found, when I had fed the latter a few days, that my cows were each giving from two to three pints of milk more per day, than when fed on rutabagas. I was feeding my cows, meanwhile, with cut hay, and 2 lbs. oil cake meal, and 2½ lbs. wheat screenings, ground.

The thought struck me that I should like to know the value of carrots for making milk, so I selected the cow that calved last, for the trial. I weighed the hay, meal, and carrots, and fed per day 27 lbs. of hay, 4½ lbs. of the mixed meal, and 22 lbs. of carrots, and she gave 35 lbs. of milk per day. I then left off the carrots, and gave the same amount of meal, and all the hay she would eat, which was 33 lbs. per day. After feeding so for a week, I found she gave 23 lbs. of milk per day. I then gave her the carrots as before, and in eight or ten days she came up again to 35 lbs. of milk per day.

This shows that carrots are worth to me to feed to cows, 82 cents per 100 lbs. Hay is worth $20 per ton in the barn, and at 3 cts. per quart, or one cent per pound for milk; 6 lbs. less hay, and 12 lbs. more milk gives 18 cents for 22 lbs. of carrots. My carrots are all gone now, or I would try one or two more cows. Next winter I hope to have another opportunity for experiment.—Abner Haven, *South Framingham, Mass.*

Preserve carefully the droppings from your hen-roosts, and by the mixture of a little plaster of Paris as you put them away in a dry place, you will have a manure very little inferior to the best Peruvian guano, and at one-tenth the cost.

THE MODERN HORSE DOCTOR; containing Practical Observations on the Causes, Nature and Treatment of Disease and Lameness in Horses Embracing the most recent and approved methods, according to an enlightened system of Veterinary Therapeutics, for the preservation and restoration of health. With illustrations. By GEORGE H. DADD, M. D., Veterinary Surgeon, Author of Anatomy and Physiology of the Horse, and the Reformed Cattle Doctor. Boston: Published by JOHN P. JEWETT & Co. Cleveland, Ohio: JEWETT, PROCTOR, & WORTHINGTON. 1854.

We have read a considerable portion of this work, and cannot but wish every one who has anything to do with horses would do the same. The author is a well-known Veterinary Surgeon, who has for many years made the horse and his diseases his especial study. The "hereditary," "blacksmith" class of horse farriers meet with no mercy at his hands. "The vile practice of blood-letting, and the use of agents that are known to depress the vital principle" are strongly condemned, while a judicious "system of *hygiene*, without which medicine may as well be thrown to the dogs as given to a sick horse," is eloquently recommended. He evidently has great faith in "our great catholicon Nature," and asserts that "the more a man knows of physiology, the less faith has he in medicine." It is with shame that we admit that "the veterinary art has, in this country, *progressed in a circle*; that our domestic animals are still the subjects of misguided notions peculiar to the dark ages, and that cruelties which *have had their day of reproach* are now being enacted over again under our own eyes." Physiology, comparative anatomy and the *causes* of disease are overlooked by nine-tenths of our so-called horse doctors, and we cannot too strongly recommend this book as calculated to work a reform in these particulars, and introduce a more humane and rational treatment of the noblest of our domestic animals.

There is some "doubtful chemistry" in the book which we would like to see expunged, and some little *scriptural* and *slang* phraseology which is not in good taste; and in the eagerness to blow away the chaff of the old systems, some good wheat may have been lost, some good practices rejected, and others adopted too much on theoretical grounds. For instance, administering muriatic, hectic, or acetic acid to assist digestion, because they are the "*real solvents of the gastric juice*;" yet, *on the whole*, we believe the work is, on the subjects on which it treats, the best extant.

EXHIBITIONS OF HORSES.

THE NEW ENGLAND HORSE SHOW came off at Brattleboro, Vt., Oct. 18, 19, and 20. It was, on the whole, quite successful. About 150 animals were entered, four-fifths of which were of the Morgan varieties—Black Hawks predominating. The trotting match was an attractive feature; 13 geldings and mares were entered for competition. The first prize of $50, was taken by *Nelly A. Sherman*, an eight year old Morgan mare, owned by G. R. ORCUTT, of Middlebury, Vt.,—time 2 minutes and 49 seconds. *Lady Beesworth* by *Rattler*, a four year old, owned by H. H. THAYER of Rutland, came in second. *Abdallah*, a six year old mare owned by J. L. BRIGGS, Springfield, Mass., came in third, and *Mississque Belle*, a four year old, of old Nimrod and Messenger blood, owned by A. N. STEVENS, of Engsburg, last. *Flying Morgan*, owned by Mr. ADAMS of Burlington, trotted a match against time, making the mile in two minutes and fifty-four seconds. Two Black Hawk and Morgan colts, each three years old, owned by Mrs. HATCH of Bethel, and GROSVENOR of Bridgeport, trotted a mile, the former in three minutes, and the latter in three minutes and three seconds.

It is to be feared that these trotting matches, useful and harmless in themselves, will engender a love for the race course, than which few things are more pernicious to the morals of a community.

THE OHIO AND PENNSYLVANIA HORSE SHOW, at Salem, Ohio, 11th to 14th of October, is said to have been very creditable. Owing to rainy weather the second day, the attendance was not so large as was anticipated, but the third day being "bright and beautiful, and the race course in excellent order," the attendance was good and the success of the show all that could be desired. About 160 horses were entered, including many fine animals in the different classes.

PROFITABLE POULTRY.—It is often said that nothing can be made keeping poultry. Last spring I had forty fine hens, half-breed Dorking and Malays, and they have hatched fifty ducks and forty turkeys, and raised one hundred and forty chickens. Since the first day of April last, they have laid three thousand three hundred and forty-seven eggs, up to the first day of October. This excels anything that I have seen in your paper.—R. J. J., *Hector, N. Y.*

LAND, it has been well said, will produce a crop of something, and it depends entirely on the farmer what that shall be—whether a crop of grain or of weeds.

OHIO STATE FAIR.

THE OHIO STATE FAIR held at Newark last week, was one of the finest Agricultural exhibitions we ever attended,—and in some essentials altogether superior to any we had previously witnessed. The *People* were there in their strength—the number present on Thursday alone being variously estimated at from fifty to seventy thousand. The weather was most auspicious, and the arrangement of the grounds creditable to the managing board and others interested. The show of Improved Stock was *the* feature of the Fair, and one in which Ohio cannot be (or has not been to our knowledge,) excelled by any other State in the Union. We had anticipated much in this department, but the display of Horses, Cattle, Sheep, Swine and Poultry, largely exceeded our expectations in both numbers and quality. The Fair was also particularly noteworthy in other respects, but want of space precludes more than this brief mention in our present number. More particular notes of what we saw and heard will be given hereafter.

REVIEW OF THE ENGLISH WHEAT MARKET.

We take the following extract from the *Mark Lane Express*, the best authority on the British grain trade:

The harvest is now concluded even in the most backward parts of the kingdom. With the exception of that small proportion carried early in August, previous to the setting in of the fine weather, the whole has been secured in admirable order. Taking the produce of the entire kingdom, we are disposed to estimate the yield at about one-fourth over an average. Whether, however, we are to have low prices during the next twelve months, may be questioned. One good crop is not sufficient to make good the exhaustion of stocks, in consequence of the deficiency in the harvest of 1853; indeed, we have heard it seriously argued that the country is not in a much better position as regards stocks now, than it was at this period last year. This proposition we do not feel inclined to agree to, but it is certain that very little wheat remained in farmers' hands at harvest time, and that it was necessary to commence on the new almost as soon as it was secured. The quantity of old foreign wheat in the kingdom was small; for though the London warehouses were well filled, there was comparatively little at any of the outports. This being the position of affairs, we do not consider that the late fully in prices has been without cause; but present rates are tempting to the growers, and we should certainly not be surprised to see materially increased deliveries from the farmers.

Foreign wheat has come sparingly to hand, only 8,340 qrs. having been received during the week. The shipments from the Baltic have lately been small. The stocks in granary have, during the last few months, been greatly reduced, and are not now heavy. The finer kinds from the Black Sea, &c., are principally in the hands of the Greek merchants, who are not inclined to sell except at high rates.—Of good Baltic wheat, the quantity on the market is moderate, and holders exhibit great confidence. On Wednesday, rather enhanced terms were asked, and in partial instances a slight advance was realized. As yet, very few transactions have taken place with the Baltic ports, in wheat free on board, either for immediate or for spring shipment; the ideas of holders on the other side being deemed too high by buyers here.

The demand for flour has been active throughout the week, and the town millers have had quite enough to do to keep their regular customers supplied. The transactions in American flour have not been so extensive as in some preceding weeks, owing mainly to the fact that the prices asked for fine qualities have been relatively above those at which English has been offered.

Of Indian Corn very little has been offered, and its value has continued to tend upwards—For fine Galatz, on passage, 34s. per qr., or $1,46 per bushel, cost, freight, and insurance is said to have been refused.

GROWING FISH.—The Cleveland (O.) City Fact says that one of the most pleasing things exhibited at their late County Fair, was a lot of brook trout, artificially bred by Drs. Garlick and Ackley, whose labors in this line we have heretofore noticed. They showed several broods of fish in different stages of growth, and have demonstrated that it is just as easy to grow fish as fowls, or any other description of food.

We hope all agricultural societies will take a hint from this, and offer premiums for such a show of fish as will best illustrate the fact to farmers that they can grow the cheapest food ever produced for man upon their farms wherever they have natural water, or can make artificial ponds. Let us have the premiums "for the best show of fish artificially produced upon any farm." It is a matter of very curious consideration, when fresh fish sells here at the same price per pound as beef, pork and mutton.

HICKORIES.—Can a hickory be successfully transplanted? People have often though tried it, and generally said no. Being a few days ago in the garden of Augustus Adams, Esq., of Elgin, we saw a large number of hickories from three to seven feet high, which had been transplanted successfully from the woods, or rather the openings, and were growing vigorously on their second summer. Mr. Adams stated that he had lost no more of them than any other tree. His plan is to dig down and down and down till he gets tired of it, and then cut off the tap root. He never stops till he gets four feet and from that to six, and yet he states that he never got so low as to find the tap root as small as the tree at the surface of the ground.—*Prairie Farmer.*

THE CROPS IN MAINE.

THE drouth for the past three years has been very severe in Maine. During last summer the prospects of the farmers were very gloomy, and many a mournful prophecy was uttered in regard to the extent of the injury. The *Maine Farmer*, however, says that the results of the harvest show that the farmers are much better off than they expected. We give the following extracts:

Hay. This crop was secured before the drouth began. There has been gathered in Maine, as far as we can learn, more than there was last year, say two thirds of a usual crop.

Wheat. This crop has come in with bright straw and plump grain, except where the weevil committed ravages. The rust and mildew have not been prevalent at all. Oats are good; not quite so heavy in kernel as in some years, but nevertheless a fair crop.

Rye. This grain is not very extensively cultivated in Maine, but where it was sown it yielded a good crop.

Corn. Corn as a general thing has proved a very fair crop, it being very sound and bright, say a two-thirds crop, which is much better than was anticipated.

Potatoes. Potatoes planted on clayey loams have done better, both as it regards quantity and quality, than they have done for several years. Those planted on sandy soils have been pretty severely pinched, but though small they are of very good quality. The rot has retired for this year at least, and we hope it will stay retired for all coming time. Other roots and garden productions are in general very good.

Apples. We have more than a middling crop of apples, both as to quality and quantity. The little destructive "Palmer worm," which nibbled our orchards last year, has not been seen this. On the whole, the crops of 1854 in Maine, make up a very fair average, when compared with a series of ten or more years.

What effect the late severe drouth may have on the production of our soils next season, we cannot tell. We have often heard the late Major Wood, of Winthrop, remark that a drouth was as good as a dressing of manure to the land. If that be true, our soils in Maine have been pretty liberally dressed for the three past summers.

THE CASHMERE GOAT.

We have on a previous occasion given a communication from Dr. S. A. Davis, of Columbia, South Carolina, in relation to the Cashmere goat and other animals imported by him from Asia. Dr. D. exhibited a male goat and a kid of this kind, and a half-blood kid, at the New York State Fair, last week, where they attracted so much attention that a crowd almost constantly surrounded them.

Dr. D. states that these animals prove, after four years' trial, perfectly hardy in South Carolina, and he thinks they would be equally as well adapted to the Middle and Northern States, as the climate there approximates to that of their native region—the latter being so elevated as to give much snow. They are truly beautiful animals, and we think there is good reason to believe they will be of great value to this country. They cross readily with the common goat, producing a prolific offspring, which being bred to the Cashmere stock till the common blood is reduced to one-fourth or one-eighth, produces an animal scarcely distinguishable from the full-blood Cashmere. When it is recollected that it is from this goat that the material for the costly Cashmere shawls is obtained, and that it sells in France at eight dollars a pound, we have some idea of the importance of acclimating the animal to the United States.

Since the above was written, we have heard that Dr. Davis sold the pair of full blood Cashmeres for $1,000, but we have not learned the name of the purchaser.—*Boston Cult.*

LADIES RIDING DRESSES.—Ladies who propose to engage in the equestrian exercises at Fairs or elsewhere, and are not provided with full riding suits, can fit themselves out quite satisfactorily by simply making a long skirt to fasten at the waist, over a common dress; in which case only a single underskirt should be worn. The Basque waist, now in vogue, will answer a sufficient purpose for riding jacket, and the soft hats now worn by gentlemen, with a little trimming, will make good riding hats for ladies.—*Ohio Cultivator.*

APPLES FOR HOGS.—The question is often asked, Are apples worth anything for fattening hogs? And how could they be used? Daniel Felker, of Concord, an observing and successful farmer, says he has for several years past fatted his hogs upon rare sour apples with just enough raw corn or oats (either ground or whole) to keep them in a healthy condition.—That they devour the apples greedily, fatten rapidly, and make solid pork. This is certainly economical feed.—*Maine Farmer.*

HEAVY CORN.—Mr. C. Piper of Lenox has sent us the stalks and ears from *one* hill of corn, in a field of ten acres, of the "same sort," on which are *nine* good heavy ears of yellow dent corn. This does not look like famine; and is a better prospect of good corn in Ashtabula.—*Ash. Sen.*

NEVER allow a stick of wood to be put on your fire, or in your stove, that has not been cut and piled up under your wood shed from three to six months beforehand. You will be sure of good fires with no greater consumption of wood, and be spared the infliction of a "smoking house and a scolding wife."

THE LARGEST HOG.—Martin Roberts, who resides on the river some six miles below Madison, in Kentucky, has a hog that weighs upwards of nineteen hundred pounds, which he has sold for two hundred dollars.

ROBERT'S ON THE POTATO DISEASE.

THE *Mark Lane Express* having received Mr. E. C. ROBERT'S well known pamphlet on the Cause and Cure of the Potato Rot, remarks on it it as follows.

While we of the Old World have been attributing the potato rot to fungi, insects, malaria, &c., &c., a farmer of the New World, E. C. Roberts, discovered so early as 1846 that it arose from "*a violation of Nature's laws*;" and in order to certify his discovery, he had recourse to a series of experiments during that and the following six years—1847, '48 '49, '50 '51, and '52—which fully bore out, we are informed, its soundness. The pamphlet gives an account of each of these seven experiments separately, and concludes by summing up the whole with a few seasonable observations.

Mr. Roberts concludes that by removing potatoes from the ground during winter less or more injury is sustained, so that a continuation of the practice results in disease or rot; consequently his cure is to allow that portion of the crop required for seed to remain in the ground during winter, or rather he plants beds purposely for seed on dry ground, which is just Nature's own plan in South America—a plan which he himself has adopted and found effectual, all traces of the disease having disappeared the third year.

The laborious manner in which the Michigan experiments were carried out by the author is deserving of special commendation; for during the progress of the crop, he examined daily the seed roots and shoots arising from them by carefully digging up so many on each occasion, and dissecting them with all the zeal of a morbid anatomist. During these pathological investigations, he found the old tuber always the first affected, the disease rising upwards; thus, as he observes, corroborating the soundness of his theory. We are not certain if we can subscribe to all the deductions of the writer, on this head, without a more detailed account of the facts than the pamphlet contains; but his labors are highly deserving of praise, and we shall be happy to hear further from him on the subject.

There is nothing new in allowing potatoes to lie in the ground during winter, for it is upwards of thirty years since we saw the practice tried, in order to improve the quality of the root for spring use, those remaining in the ground being much better than those stored in the usual way. This fact, it will be perceived, is in favor of Mr. Robert's theory; so that it is possible that the maturity of potatoes, especially seed, is a more difficult and important task than is yet generally imagined. Also since 1846 the theory has often been promulgated in this country; but we believe that Mr. Roberts will have no difficulty in establishing the priority of his discovery, should its value recommend it to general practice.

FROST AS A MANURE.

We know of no treatment so directly beneficial, for almost every class of soils, as that of thinning up land in narrow ridges in the fall or early winter. There are few soils worth cultivating at all, that do not contain more or less materials which can be made available to plants by the combined action of air and frost.

Take two plots of heavy soil, side by side, and let one lie unmoved till spring, while the other is *deeply* plowed in autumn, and the result will be very visible in the spring crop—But the manner of plowing is important. To secure the greatest advantage, a single furrow should be thrown up and another back-furrowed directly upon it so as to produce a high ridge, then another ridge is to be made in the same manner with a deep dead furrow between the two. The process is to be continued thus through the whole field, so that when finished it will present a surface of high ridges and deep dead furrows succeeding each other, about once in two or two and a half feet. If prepared in this way, the frost will penetrate far downward, loosening and disintegrating the soil below the furrows, while the ridges will crumble down, and as they will not hold water, the air will circulate freely through them, decomposing the mineral portions, and conveying in ammonia and other gasses. This operation will be equal to ten or more loads of good manure upon clay or compact soils.

In the spring it will only be necessary to run a plow once or twice through the center of each ridge, and then level the whole down with a heavy harrow.

Another advantage in this process, is that when land is thus prepared it dries out and warms several days earlier in the spring—Again there are some soils that are exhausted upon the surface, but which contain poisonous substances in the sub-soil. If this sub-soil is thrown up in contact with the air and frost during winter, these poisonous compounds (usually proto-sulphate of iron or manganese) will be destroyed, or changed to a harmless form, during the winter.

The above practice is especially recommended in the garden. One of the most successful cultivators of an acre of ground in our acquaintance, digs it up in the fall to the depth of three to four feet, making deep trenches and high ridges so that the whole acre appears to be covered with high winrows of hay placed closely together.

We strongly urge every farmer who has not tried this method, to lay out their plans now for experiment in this way, on a larger or smaller scale, during the present season.—*American Agriculturist.*

AGRICULTURE IN FRANCE.—The French Minister of War has informed farmers, through the prefects, that they may apply to the generals of the various military divisions, for the services of soldiers, at the moment of the harvest, in case there is an absolute want of hands. The generals will fix beforehand the prices to be paid. As long as there is a single civil laborer unoccupied no soldier will be allowed to take part in the getting in of the crops.

HEAVES OR BROKEN WIND.

We take the following extracts from Dr. DADD'S *Modern Horse Doctor*. The subject is one of much interest and importance, and did not our space forbid we should give the entire article:

The disease bears some resemblance to asthma in the human subject, for in each there is nearly the same difficulty in respiration, attended with dyspepsia and emaciation; there is this difference, however—in man there are remissions; while in the horse with confirmed heaves (broken wind) there is scarcely any cessation. It is quite common, in Massachusetts, to hear horsemen define every case of abdominal respiration as *heaves*: such are not to be considered, however, as so many cases of broken wind. In order to make out a pure case of the latter, we must have a kind of jerking double flank movement in the process of expiration. Distention of the lungs, or inspiration, must also be followed by a corresponding expansion of the chest and flanks. A slight cough is generally present, which has a wheezing sound, sometimes resembling a sort of grunt, and the subject is a confirmed dyspeptic, having a voracious appetite, *staring coat*, large belly, spare muscles, dull, miserable look, drooping head, unwilling to travel fast, and, when urged to do so, becomes soon exhausted; the excretions also indicate derangement of the digestive organs. These are the principal symptoms of broken wind, and we have generally found these present in what is called "*heaves*."

Regarding the nature of broken wind—which, however, is a very funny name for a pathological condition of this character—it originates in disease occurring either in the organs of digestion or of respiration; the former affecting the latter, through the sympathy that is known to exist between them, or else from innutrition—the digestive organs failing to furnish the proper amount of nutrimental matter to supply the respiratory apparatus with its required fuel. The lungs, or rather its air cells, are then dilated, while the respiratory passages and lining membranes are contracted or lessened in calibre, either from contraction of their tubes or thickening of their lining membranes; and this state of the parts is all that we require to explain the peculiar phenomena of *abdominal respiration*. * * * The direct causes of heaves or broken wind are over-exertion and indigestion.

Treatment.—The object is to improve the patient's health; and if we can do this successfully, an improvement in a curable case generally follows. We must restore *digestion* in order to cure indigestion, and in this view we give aromatic tonics; the following we have used with considerable success:—Tincture of aromatic sulphuric acid. Dose, one drachm in a pint of water, night and morning. Most animals, however, will drink it from a bucket.—In the mean time we put the animal on a course of the following alterative medicine: Powdered ginger, gentian, sulphur, salt, cream of tartar, charcoal, licorice, elecampane, caraway seeds, and balm of Gilead buds, (chopped fine,) equal parts. Dose, one ounce every night in the food.

Changes in diet, exercise, and management, calculated to fulfil the indications alluded to above, are indispensable. So soon as considerable improvement is perceptible, the aromatic tincture should be omitted; and, instead of giving one ounce of the alterative as a dose, give half an ounce night and morning. A broken-winded horse should always be watered from a bucket, regularly three times a day; and if he be a foul feeder, arm him with a muzzle, and only remove it at *meal time*. In addition to the above remedies, we occasionally allow a small quantity of garlic, say a couple of heads every other day, chopped fine, and mixed in the food.

WHAT THE FARMER MOST NEEDS.

THEY need organization. They want farmers' clubs, and neighborhood libraries of agricultural books. They need discussion. They need more intercourse, not only in their own town and county, but throughout the state and country, to see and learn what other farmers are doing, and adopt the improvements made by them. They need to become satisfied with their vocation; to get rid of the prevailing notion that farming is necessarily an unmental employment; that is, that the farmer has no occasion to think; has no occasion for education, and never can become wealthy, or what the world would call respectable, while engaged in the culture of the earth, and therefore he seeks the first opportunity to escape from an occupation placed under him not only by all others, but his own class also. The great need of the farmer is, that he shall declare himself independent of all other classes, at least more so than they are of him, and of course he is entitled to engage in any other calling whatever; and if he is a man of toil, that is no reason why he should not be a man of intellect. The great need of the farmer is organization, and this must be accomplished by a few self-sacrificing men, who will undertake the labor of establishing and maintaining farmers' clubs in every neighborhood. Farmers need to drop politics and take up agriculture. They must talk, and read and think, and they will be sure to act, or their children will act for them.—*Penn. Farm Journal.*

HENS SHOULD BE KEPT WARM IN WINTER.—I saw an account of 27 hens kept last winter, in an open shed, where they laid 52 dozen eggs in 4 months. Now, it is my humble opinion that if they had been kept in a warm place they would have laid still better. Last winter I had 24 hens a part of the time, but about the middle of winter killed off 5; I kept them in the basement of a barn, fed them with all the screenings they could eat, with occasionally a little corn, and in four months they laid 70 dozen eggs. I had some Brahmas, some common, and the rest were common crossed with the Shanghai.

My hens laid more eggs last winter than they do this spring, because now they are very much inclined to set.—*Prairie Farmer.*

Orchard and Garden.

HORTICULTURAL ITEMS FROM OHIO.

EFFECTS OF CLIMATE ON FRUITS.

Messrs. Eds.—Many people do not know of the great difference in the quality and productiveness of the same variety of fruit in different localities—some first rate in one place, being worthless in another not far distant. To learn their value in this locality, I have been particular in my observations for the past ten years

Apples.—The early apples which produce well here are *Early Harvest*, *Summer Pearmain*, and an early sweet apple which ripens before the *Bough*—equal to it in quality and far more productive. I have not been able to identify this fruit with any in the different works on fruits.—After so long a trial, I have put the *Sweet Bough* down as unworthy of cultivation here, on account of its unproductiveness—for the period of ten years it has not borne a good crop. *Red Astrachan*, *William's Early* and several others are not fully proved. Of fall apples the *Rambo* heads the list here; it is good and always productive. The *Maiden's Blush* is a good regular bearer; the *Fall Wine* is also of fine quality and a good bearer.

The *Fall Pippin* is rejected for the same reasons as the *Bough*. Of the winter apples, the *Yellow Bullflower*, *Michael Henry Pippin*, and *Talpannocken*, appear to be the most productive. The *Newtown Pippin*, *Rhode Island* and *Winter Greening*, frequently bear well—the *Spitzenburgh*, *Seek-no-further*, and *Roxbury Russets*, are poor bearers—the latter having produced but two fair crops in ten years—frequently missing to bear two or three years in succession. I have about 150 varieties of apples under trial, but do not wish to be too hasty in my conclusions.

Pears.—Of pears which succeed here, the *Bartlett*, *Summer Bell*, *Dearborn's Seedling*, *Virgalieu*, and a seedling which I call *Hampton's Cluster*, are worthy of propagation. The *White Doyenne*, does not succeed, it casts its fruit, which, although fair is deficient in quality—another marked change of locality. The *Flemish Beauty* has been good two years in ten, of which this dry season was one. It is a fine bearer, but deficient in quality in wet seasons. Various other pears are on trial.

Cherries.—The finer kinds of cherries have been quite unsuccessful. The *Black Tartarian* does best. I have some grafted on the common wild and dwarf choke cherry for experiment—although they thrive finely, and blossom full, they have not fruited.

BARREN GRAPE VINES.

In a recent paper, mention is made of a barren Grape vine—the writer calls it an Isabella, and says that it blossoms profusely, but never bears. From the circumstance of its blooming so profusely I suspect it to be a male vine—they always blossom profusely, and the blossom larger and more showy than a bearing vine—but if it was raised from a cutting or slip of a bearing Isabella, or it might have been raised from the seed of one.

If the vine should be such as I suspect there is no way to make it bear, but to graft it from a bearing vine. I have seen such vines that appear to be near 100 years old, and which have not been known to produce a single grape. We often find the wild Mulberry, Persimmon, and several other trees in the same situation—some having only male blossoms, while some trees have both kinds.

SEEDLING FRUITS.—ROUND SEEDS.

An item copied from an old publication, has recently appeared in several papers, stating that the round seeds in apples would produce the same kind of fruit, when in bearing, as the graft which bore the apple and that the other seeds would produce the same as the original tree upon which the graft was inserted. Now it is a new idea and an improbable circumstance to me that fruit blossoms can be fertilized by the stalk and roots, or that a hybrid fruit can be produced by any other than by cross-fertilization, natural or artificial.

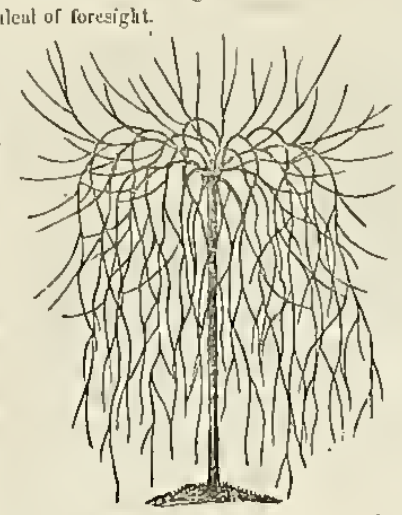
That some seeds will produce the same as the parent tree, is the result of natural fertilization from its own blossoms; plant a large square of one variety of fruit, and select seeds from the centre of the square, and the produce of the seeds will nearly all resemble the parent trees. Why? because they were fertilized by blossoms of the same variety. I have had practical illustrations of this in my own experience—the same will be the case of an isolated tree, if there are no bees to carry the farina on their legs to its blossoms from other trees. I know of an orchard of seedling apple trees from such a source amounting to about fifty trees which are nearly all similar. If seed fertilized by their own blossoms are always round it is a valuable discovery, and should be proved.

SEEDLING GRAPE.—I have a fine seedling grape from a similar source as the Muscadine noticed in one of your late papers. I think that it would make a fine wine grape being very saccharine and aromatic. I may send you an outline in my next. W. C. HAMPTON.

Canton, Berlin Co., O.

AMERICAN WEEPING WILLOW.

There is something so attractive and so graceful in the character of drooping trees, says the *Horticulturist*, that they arrest the attention of persons who would scarcely bestow a glance upon the noblest and rarest trees of the ordinary upright habits of growth which prevail among the mass of forest trees. We see this exemplified daily in our own grounds. A Weeping Willow, common though it be, never fails to elicit admiration. In the hands of a skillful, judicious planter, no other trees are more effective in giving variety, character, and expression, to a landscape; but they must always be used sparingly, and with the exercise of good taste and a great deal of foresight.



Among Weeping trees recently brought to notice is the American Weeping Willow, from France. It is a trailing species of American Willow grafted on some upright-growing sort. When worked six or eight feet from the ground, it forms one of the most elegant weeping trees we have yet seen. The branches are very slender and numerous, and take a downward direction at once, like the falling spray from a *jet d'eau*. The above is a sketch of a young tree three years from the graft. It is more hardy than the common sort, and being a much smaller tree, will be much more appropriate for small lawns and cemetery lots.

FAILURE OF DWARF PEARS.

Several of the western cultivators of fruit speak of the death of their dwarf pear trees during the past season, owing perhaps in part to the unusually unfavorable weather. The same result has occurred to a very limited extent, in some particular localities further east, while a few miles distant from these localities, no result of the kind has happened. We are inclined to regard it in the latter instance, as one of these disasters that occasionally happen to various kinds of trees at remote intervals, without occurring again perhaps for a life-time.

How it may be in the more Southern States, we are not so well able to judge; but we infer from a statement in a late number of the *Michigan Farmer*, that their death is not owing to the same causes that produce short-lived trees on quince, elsewhere, namely, unequal nature between stock and graft, for a large share of the deaths occurred to those which continually do best as dwarfs. It appears that H. H. Brunet, of Ann Arbor, a skillful cultivator, lost *twenty* trees out of *forty*—and on looking over his list, we find that about *fifteen* of these twenty, are what are usually regarded as thrifty and durable varieties on the *Angers* quince, viz. Buffman, Summer Frankreal, Diel, Oswego Beurre, Glout Morceau, Louise Bonne Jersey, Madeleine, Tyson, &c., while a considerable number of those that survived, and are reported as doing well, are such sorts as are commonly poor growers on the quince, such as the Bartlett, Aremburg, Onondagar, Seckel, &c.

This result leads us to suspect that the trees which perished were allowed to grow *too rapidly*, and consequently did not mature their wood, for notwithstanding the changes of temperature, so well as the slower growing and better ripening shoots of the other sorts. At any rate, we should like to hear of further observations in relation to this point. We remember some eight or nine years since, that a nursery in Western New York lost several thousand dollars worth of young *standard* pear trees by a combination of unfavorable circumstances in the winter, while large blocks of young dwarfs side by side entirely escaped. A similar result occurred in some other nurseries at the same time. But single occurrences like this, or like the loss of the dwarf pear trees in the west, the past winter, are insufficient to establish a rule. A longer and more general trial must be made.—*Country Gentleman.*

Is Fruit Healthy?—The editor of the *American Medical Monthly*, in a timely article on a greatly misunderstood subject, says that partaking immoderately even of the ripest and best fruit, is as injurious as drinking to excess, opium eating, or surfeiting of any kind; and that eating unripe fruit, even when prepared by the most skilfully conducted culinary operations, and enticingly presented in the garniture of paste and frosting, is unsafe; eating fruit at improper hours, too—ripe as well as unripe—is highly pernicious.—*Rochester American.*

We always supposed that "partaking *immoderately*" of anything was "injurious." We cannot but think that the moderate use of ripe fruit is highly conducive to health.—Eds.

GRAPE CULTURE UNDER GLASS.

Construction of the Vinery.—Instead of the common practice of building the front wall of the house on pillars, I would advise that a solid wall from the foundation be made, as I consider an inside border to be more injurious than beneficial to the roots of the vines. The principal cause of the shriveling of early-forced grapes is, in my opinion, owing to the roots being over-heated, and not having sufficient moisture. When they extend far into the interior of the house, it is impossible for even the most experienced gardeners to guard against this completely.

Having given my objections to an inside border, I may add that building a wall will be found a saving of expense. I consider upright sashes of little or no use in front, and I would recommend the back wall to be built much higher than it commonly is, as the vines always fruit best at their extremities. I would also have the pathway of the house paved with stone, which would certainly look much better, and be less expensive in the end. Where there is only one house to be erected, it would be much better to have it made in circular in front, as it would be more exposed to the sun's rays.

With regard to the construction of the heating apparatus, I would recommend the hot water instead of the smoke-flue system, and the use of Week's Conical Boiler. Although it is generally allowed that many a good bunch of grapes has been grown by the heat of an old smoke flue, the hot water system is universally adopted in all new vineries throughout Great Britain. Week's boiler is formed of 2½ to 3 inch pipes, all connected with the furnace in the centre. The body of water being small, and the surface of pipe large, the water soon heats, and circulates rapidly. I would also have the furnace or fireplace made much larger than is usual, so as to afford sufficient space for a large, slow-burning fire, in order that the operator may have it in his power to keep a steady heat in the house. When the fireplace is small, he has to stir it often, to keep up the desired heat in cold weather.

Formation of the border.—The site on which the house stands has a gradual inclination to the south, twenty inches in thirty feet, which is very desirable, in order to carry away rapidly all superfluous water. The border is fifteen feet wide and three feet deep; it is dug eighteen inches below the original surface, and raised as much above. In the bottom are placed twelve inches of stones, to form drainage, and these are overlaid with some rough material, vegetable matter, or turf, to prevent the earth from adhering to them. The earth which forms the border was the top-spit taken from the corner of an old pasture which the cows frequented, and which was undoubtedly very rich, mixed with a goodly quantity of well-rotted animal dung (I believe cow dung to be the best,) together with a liberal quantity of bone dust or something equivalent. I also approve of having a drain along the border, near the centre, on a level with the stones at the bottom of the border, open at each end, in connection with several intersecting ones, into the interior of the house, in order to dry and convey a current of air through the border, which is most assuredly beneficial to the growth of vines. I am much in favor of having some rough material mixed with the earth in the border, such as old lime, limestone, or broken bricks, to keep the soil loose.

Planting.—Of course choose good, healthy vines. It is necessary, when planting, to lay the roots in some nice light earth, say a mixture of leaf-mold and white sand. White sand answers the purpose best, because it is free of oxide of iron. Particular care must be taken not to plant too deep, as nothing is more injurious. The point of divergence of the ascending and descending axis—that is of the root and stem—should always be even with the surface. I would have good, strong vines, planted about six or ten inches from the outside of the wall, and introduced through holes made in the building six inches above the surface of the border, and from four to six inches in diameter, with a projection toward the inside. It is customary to plant a vine for each rafter. I prefer one in the centre of each alternate sash, in order to grow one rod for each rafter in the house, as the less the roots are interwoven with each other, the better.

I have an abundant supply of water during the warm weather, both inside and out,—the former to keep down insects, which are very numerous in this country, and the latter for the use of the border. I have been in the habit of syringing in the early part of the day, instead of the afternoon—say about eight o'clock, in clear weather; and in dull, cloudy weather, the operation was omitted. During the absence of rain, I thoroughly soaked the outside border about three times a week, which border has an excellent covering of strong cow dung, which greatly increased the vigor of the vines.

Forcing houses should receive air as frequently at the front as at the top; and when air is admitted at the front, it should be at ventilators opposite the pipes or flues, in order to have a circulation of heated air through the house, resembling that of their native country.

Pruning.—I consider this one of the most important operations in the management of vines. There are various methods adopted by gardners, with equal success; but there is undoubtedly one system superior to all others, and perhaps that has not been ascertained.—However, there is one way of pruning the rod like a walking stick (the renewal or long cane system,) and another with spurs of one eye or more. The vines here, that I am alluding to, were pruned in the former way, and have done remarkably well this year. I measured some leaves of the Black Hamburgh, which I found to be 13 by 13 inches; and those of the Muscat of Alexandria, 13 by 14 inches, and wood three inches in diameter, of this year's growth, and fruiting uncommonly. The bunches of course are not large, which could not be expected the first year. One bunch of the Royal Chasselas measures 12 inches in length, and several berries of the Black Hamburgh measures 3½ inches in circumference.—Jas. Cowan, of Baltimore, *in Horticulturist.*

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending Oct. 10, 1854.

Chas. P. Baily, Zanesville, for improvement in railroad car seats.

Lemuel W. Boynton, South Coventry, Conn., for improvement in machinery for making hat bodies.

John A. Bradshaw, Lowell, for shingle machine.

Jesse Carpenter, New York, improvement in spinning rope and cordage.

Stephen D. Carpenter, Madison, Wis., rotary pump.

Samuel Carpenter, Flushing, improvement in machine for turning hubs, tool handles, &c.

John D. Dato, Philadelphia, cutter heads for planing machines, &c.

Edwin G. Dunham, Portland, Conn., improved rock drill.

Augustus Eckert, Trenton, O., improvement in magnetic alarm bells.

Thaddeus Fowler, Waterbury, Conn., improved sewing pin.

Louis A. Gussin, Thibodeaux, La., improvement in the construction of sugar-making apparatus.

Benj. F. Gussin, Covington, Ky., improvement in railroad chair machinery.

John W. Griffiths, New York, improvement in the construction of ships.

Robert Grant, New York, improvement in brakes for checking and starting cars.

Eben N. Horsford, Cambridge, Mass., improvement in compounds for neutralizing chlorine.—English patent May 9, 1854.

Simon Ingersoll, N. Y., improvement in pawl drills.

John Jack, Fayetteville, Ohio, improved saw gummer.

Lyman Jennings, Erving, Mass., improvement in cans for holding liquids.

Stephen C. Mendenhall, Richmond, Ind., improvement in brooms.

Elijah Morgan, Morgantown, Va., for shingle machine.

Richard Oliver, New York, improvement in fastening for garments.

E. Prescott, Leominster, Mass., improvement in machines for splitting barn, &c.

John P. Sherwood, Fort Edward, improved damper for stoves.

Cornelius Speer, New York, improvement in ginning and cleaning cotton.

Henry Tougne, Nashville, Tenn., improvement in steam engines.

Henry Volkening, New York, for polishing machine.

Albin Warth, New York, for improvement in turning lathes.

Irvin A. Williams, Utica, for improved locomotive lamp.

Thomas B. Woodward, Kensington, Pa., improvements in smut machines.

Edward S. Woolsey, Astoria, N. Y., improvement in the construction of sugar boilers.

Samuel B. Howd, Syracuse, assignor to Thos. F. Davis, James S. Leach and Richard F. Stevens, improvement in process for the manufacture of salt.

RE-ISSUE.

Horace Smith and Daniel B. Wesson, Norwich, Conn., improvement in fire-arms. Patented Feb. 14, 1854.

Samuel Whitmarsh, Northampton, improvement in calorifieres. Patented Aug. 17, 1852.

MANUFACTURE OF PAPER IN THE UNITED STATES.

A paper manufacturer in England, who has recently visited the United States in search of information relating to his business, has communicated his experience to the London Daily News. In Great Britain there is a heavy excise duty on the materials for making paper, which is paid by the manufacturers, and this has greatly retarded the introduction of improvements in that country. In his letter, the manufacturer referred to, says:—"It is perfectly true, that the material necessary for making paper is in existence to any extent, and only requires to be developed. They have found this out in countries where the trade is free and enterprise rife, viz., the United States. In that country the consumption of paper is four times as large as our own per head, and may be put down at 300,000,000 lbs. annually.—Manufacturers here recourse to substances scarcely known here, and straw is employed, strengthened with stronger fiber, for thin and thick woven papers, as well as for mixing with white-paper pulp. The waste from palm leaf manufactures, swamp canes, wood shavings, and other materials, are employed in making paper, and the quantity of white paper is made more abundant by brown being employed for many purposes it is not employed for here; such as envelopes and thin wrapping papers. The material for making brown paper is, and will be always, more abundant than those for white paper."

This manufacturer overlooks the fact that the color of material is of no great importance, if the quality is obtained, as it is very easy to bleach almost any vegetable substance with chlorine. Respecting the manufacture of paper in our country, he says:—"Stimulated by the reports of Messrs. Whitworth & Wallis, I visited the States to see how they managed the mills there. *I was completely taken by surprise at the advanced state of the trade in every department, up to the finest writing and drawing papers.* Every improvement that had been invented in our country, is in universal operation there. The elastic state of the manufacture arising from a constantly increasing demand, the free communication between one man and another on all matters connected with machinery, the intelligence of the workers, and above all, freedom from any legislative regulations or impediments, all combine to produce a state of the highest prosperity. It is true that the raw material is becoming as scarce there as it is here, and is, besides, 20 per cent. dearer; but fresh sources of supply are being opened, which promise to be inexhaustible. I myself saw and have specimens of an excellent quality of printing paper, made from the canebrake found on the banks of the great rivers there, under a new simple process. Should the plan be carried out, there will be no scarcity of material in America.

The short supply felt in England has been made shorter by the large exports of rags to the United States. Besides taking this supply the Americans buy up, for their own consumption, material we cannot use for the same purpose, from sheer want of knowledge of our business. Nor will there be any great improvement till there is new blood in the trade, and its shackles are entirely removed."

This is high testimony to our advancement and superior modes of manufacturing paper; we have no doubt but, from the greater amount of attention which is now being paid to make good printing paper from other and cheaper material than rag pulp; and also from the great number of experiments now making to develop the same, that in the course of a year or two from the present time, the price of paper will be greatly reduced. The foregoing information we present to our people, to assist and stimulate them in advancing improvements in this manufacture, knowing as we do, that cheap paper affords means to disseminate a greater abundance of useful information among all classes.—*Sci. American.*

SAWING MACHINES.

The vast timber interests of our country is evidenced by the great and universal attention which has been devoted to timber-cutting machines of every description. To the many various improvements in sawing machinery which have already been made, Phinney Youngs, of Milwaukee, Wis., has added another, for which he has taken measures to obtain a patent. It relates to sawing boards direct from the log, and consists in the use of two pairs of saw guides, attached to vibrating levers—one pair at each end—in such a manner that the guides may be brought in contact with the saw (a circular one) at either end. When one pair of guides are brought in contact with the sides of the saw, the guides at the opposite ends of the levers will be thrown out from the saw at the period when the carriage has moved to the end of its way and received its return motion, whereby it is enabled to cut both ways—during both the forward and back motion of the carriage. He has also applied a combination of devices for setting the log correctly and quickly.—*Sci. Amer.*

New Railroad Track.—Mr. D. C Grinnell, of this city, has exhibited to us the drawing of an improved railroad track of his inventing.—The improvement consists in making the track of four rails instead of two, or one gauge within another. Each car has trucks of two widths, and there is a double safety against running off. The weight of the locomotive being borne on the double truck will also be greatly augmented, and a much higher rate of speed attained than is now possible. It is estimated that a road built in this manner might be traversed with security at from 100 to 150 miles per hour. The express would not be double that of an ordinary track, as lighter rails may be used.—*N. Y. Tribune.*

Domestic Economy.

Rice Milk.—Pick and wash half a pint of rice, and boil it in a quart of water till it is quite soft. Then drain it, and mix it with a quart of rich milk. You may add half a pound of whole raisins. Set it over hot coals, and stir it frequently till it boils. When it boils hard, stir in alternately two beaten eggs, and four large table-spoonfuls of brown sugar. Let it continue boiling five minutes longer; then take it off, and send it to table hot. If you put in raisins you must let it boil till they are quite soft.

A Farmer's Rice Pudding.—This pudding is made without eggs. Wash half a pint of rice through two cold waters, and drain it well. Stir it raw into a quart of rich milk, or of cream and milk mixed; adding a quarter of a pound of brown sugar, and a table-spoonful of powdered cinnamon. Put it into a deep pan, and bake it two hours or more. When done, the rice will be perfectly soft, which you may ascertain by dipping a tea-spoon into the edge of the pudding and taking out a little to try.—Eat it cold.

A Plain Rice Pudding.—Pick and wash a pint of rice, and boil it soft. Then drain off the water, and let the rice dry and get cold.—Afterwards mix with it two ounces of butter, and four ounces of sugar, and stir it into a quart of rich milk. Beat four or five eggs very light, and add them gradually to the mixture. Stir in at the last a table-spoonful of mixed nutmeg and cinnamon. Bake it an hour in a deep dish. Eat it cold.

Cranberry Jelly.—Make a very strong isinglass jelly; when cold, mix it with a double quantity of cranberry juice, pressed and strained; sweeten and boil it up, and make it into the desired shape, by straining into the proper vessels; use good white sugar, or the jelly will not be clear.—*Ger. Telegraph.*

Cranberry and Rice Jelly.—Boil and press the fruit, strain the juice, and by degrees mix it with as much ground rice as will, when boiled, thicken to a jelly; boil it gently, stirring it, and sweeten to your taste; put it into a basin or form, and serve with cream or milk.—*Ger. Telegraph.*

To Make Indian Breakfast Cake.—Wheat flour, one pint bowlful, Indian or corn meal ditto, three well beaten eggs, one table-spoonful of butter, and a pint of milk—bake in small pans buttered—a quick oven.

A Farmer's Pudding.—3 lbs. yellow corn meal, 1 lb. beef suet, 1½ pints molasses, 1 lb. dried currants or whortleberries. Boil the pudding four hours.

Educational.

(For the Rural New-Yorker.)

LEARNING AND LABOR.—NO. II.

It is true, from the necessity of the case, that every literary man must be a tax upon the community in which he lives. He must eat and be clothed; but if he can give in return for what he receives a something that will improve the condition of man, if he can diminish pain and suffering, if he can throw light upon a mind now wrapt in darkness and ignorance, if he can by deep and patient thought seek out the hitherto hidden mysteries of nature and nature's God, and thereby raise his fellows in the scale of being, he earns his support; yea many times—infinitely more than he receives. It is a question of no small moment whether there is a demand for the vast number who are now crowding the learned professions. Indeed, we need not look for a reply. It is evident that there is no such demand. It is believed that, laying aside the mere *pretenders*, the number of professional men far exceeds the demand. Who believes that a little village needs from fifteen to twenty doctors, or as many lawyers?

Hence every young man should ask himself at the outset in his career, "In what sphere can I be the most useful? Am I resolved upon this or that course of life that I may promote the welfare of those around me, or am I actuated by supreme selfishness? Is it *labor* combined with living that I seek, or is a living alone honorably or dishonorably obtained?"—If these questions were asked and answered with honesty of purpose, multitudes who now suffer the gnawings of hunger, whose tattered garments bespeak their poverty, would receive the fruit of their toil, and the increase of the soil enriched by the sweat of productive labor. The Poor House walls would refuse longer to bo'd the pauper. The slave would lift his unshackled hands to heaven and praise his God that he is permitted to breathe the atmosphere of the free.

How long will it be ere men will obtain an education that they may more easily *earn* their sustenance, instead of taking from the mouth of the laborer *his* hard-earned bread? Let a community of clergymen now situated in close proximity separate themselves and go illumine the dark corners of the earth. Let them heed the wail of nine-tenths of the human family over which darkness and paganism hang like a funeral pall. Let the physician who fears he is upon another's ground, go alleviate suffering elsewhere. Let the office-seeking politician, instead of stirring up strife and discord in the halls of legislation, go till the soil and live by the sweat of his *own* brow.

Sceptres would then drop from the hands of tyrants. Thrones would totter from their very foundations, and crumbling, fall to the ground. Crowned heads would bow to toil. Legislation, quackery, party strife, would thereby cease, those who formerly sustained them being engaged in nobler avocations. But so long as the laborer, bending to his toil, feels that labor is humiliating, that he is in bondage, unfitted for the society of the learned, whenever an opportunity presents he will most assuredly drop his implements of labor, and resort to almost any expedient to obtain their favors. He naturally loves to be praised and flattered, and far too many are ready to purchase the applause of the multitude, at the expense of strict and rigid honesty. The fact should be definitely understood that he who produces nothing in any department of human industry is a pauper and ought to be treated as such.

The laboring classes compose the strength of every nation. They are the only dependence in times of war and the sole support in times of peace. But vastly more effective would the laborer become if learning was mingled with his toil. Then let the laboring classes be thoroughly educated. Let learning and physical labor be united, and not have the few trained that they may stand above their fellows. No! let them rather be identified with those who would bless mankind, and raise them higher and yet higher in the scale of excellence. That labor is elevating is a truth. That civilization is the fruit of toil is universally admitted. Then why drop your implements of labor and separate yourselves from the true benefactors of our race? Perhaps the good by you accomplished is to you as yet unseen; but the future will reveal all things from the present hidden. The time will come when your works will be known and their true worth appreciated. Then toil on weary laborer in your mission of duty, that your virtues may live while your soul-bereft body mingles with its mother clay.

Would you be one in the glorious conflict now waging for right? Then spurn the offered bribe of an unearned name. Be known as one who toils for what he receives, little though it be, and rest assured you will not toil in vain. A great change has already commenced. The partition walls which have long stood between the learned and unlearned are fast crumbling down. Thousands may now be found—men of high natural endowments—who deem it no dishonor to be clad in the laborer's garb.—While such men live, it will be no disgrace for the laborer to wear his dusty honors thick upon him. And proud may he be of his thread worn garments, rather than that pampered pauper who owes his gaudy equipage to the toil and sweat of another. C. F. B.

Climax Prairie, Mich., 1854.

The District School.—Mr. Burke very wisely said that schools were the cheap defences of a nation. They are truly the nurseries of popular liberty. By mingling the children on equal terms, in common pursuits, the distinctions of party and birth, and religion, are made to disappear, and they grow up to form one homogeneous people, fitted to appreciate and resolved to maintain our republican institutions.

The district school is pre-eminently the school of the farmer. There he expects his children, generally, to get all the intellectual training they are ever to receive at school. It is his duty, therefore, as it should be his pleasure to do what he can to promote the best interests of these institutions. Surely, none friendly to American freedom, should wish to break up these common schools of the people, or to scatter the common fund provided for their support, to build up sects and parties among us, hostile in character and feeling, to each other, and dangerous to the government of the country.—*B. Thomas.*

Value of a Schoolmaster.—There is no office higher than that of a teacher of youth, for there is nothing on earth so precious as the mind, soul, and character of the child. No office should be regarded with greater respect. The first minds in a community should be encouraged to assume it. Parents should do all but impoverish themselves, to induce such to become the guardians of their children. They should never have the least anxiety to accumulate property for their children, provided they can place them under influences which will awaken their faculties, inspire them with higher principles, and fit them to bear a manly, useful and honorable part in the world. No language can express the folly of that economy, which, to leave a fortune to a child, starves his intellect and impoverishes the heart.—*Channing.*

Useful Olio.

HOW TO BECOME A CADET.

"How can I become a cadet?" is a question very prone to arise in a "Young American's" mind, when stirred by fife and feathers. Briefly this. For each Congressional District one cadet is allowed, whose appointment is in the gift of the Representative in Congress from the district. Contingencies considered, a vacancy occurs about once in three years for each district. So your appointment depends first, on there being a vacancy in your district, and secondly, on your worthy or unworthy Member of Congress.

The President makes twelve appointments at large each year, but as you value your peace of mind, do not hope to be one of his elect.—And be not over sanguine on any score, for it is said that during the Mexican war, he had ten thousand applications in one year. Appointments all come from the Secretary of War, to whom a formal application should be made; but your M. C. really selects for appointment. Now a far more vital question for you to consider is, are you fit to be appointed? Of ninety-six cadets appointed in the class of 1840, only twenty-five graduated, and generally from a half to a third of those first appointed doff the cadet to don the brevet.

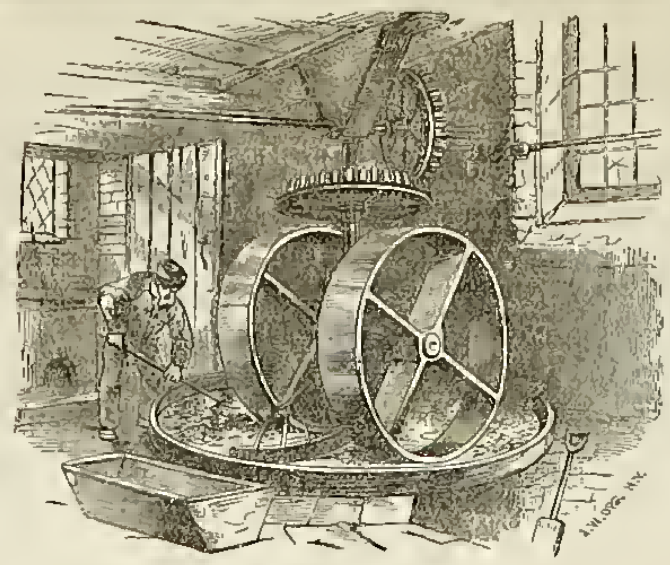
The surgeon's examination often signifies exeunt for a dozen neophytes, and as many more exhibit such idiosyncracies, in reading, writing, orthography and arithmetic, that the unsympathising examiner quietly remands them back ship.

Then comes the January exhibition, where algebraic wrecks are consigned in fearful numbers to the parental underwriters. So, too, in June and January, even to the last, the ill-boasted, the weak-helmed, the mal-adapted, are singled out from among their stouter fellows, and with stern justice are banished from seas too rough for them.

The martial aspirant should consider these things before becoming a cadet, and remember that cadetship is no mere holiday training, no refined penenckism, but a four years of discipline to body, mind and heart, sorcerer by far than any other educational course in our land involves. But if a sentiment of vigorous manhood, a courage patiently to endure present trial for future good, and if an orderly zeal for intellectual culture and hardihood, are living facts in his nature, then I know not how a youth can become so much a man as by a West Point education.—*Putnam's Magazine.*

Cinnamon Gardens in Ceylon.—Picture a wild plot of fine white sand, in which grow, in irregular tufts, bushes of a perennial green, but of a green of every shade, varying from the faintest yellow to the most sombre brown.—Nothing can be more delicate than the first tender leaves of the cinnamon bush, as they shoot forth variously from the branches, half opening, half curling up, as if afraid to trust themselves to the broad garish light of day.—Their flavor, too, is a faint, pleasant, aromatic one, that tempts the early wanderer to pluck them occasionally as he brushes past; and while the dew is rising in vapor from the leaves, caught up by the morning sun, it carries with it a delightful perfume of the spicy shrub, which makes the air peculiarly pleasant.—*Forest Life in Ceylon.*

It cost thirty thousand dollars to prove a lady of unsound mind, in an English Court.—The trial lasted sixteen days.



THE MANUFACTURE OF POTTERY.

The manufacture of earthen vessels has been carried on since the earliest period of recorded time. Among the first arts discovered and practiced by nations emerging from barbarism, is the molding of clay into the forms more or less perfect and adapting it to the uses of domestic life. Pitchers for carrying water, cuhbashes for holding food, and not unfrequently urns for the pious purpose of depositories for the bones and ashes of the dead, can be traced to nearly every nation that now exists or has existed on the globe. Long before the use and working of the metals was commenced, the more plastic materials of which earthen ware is composed were made to assume various shapes of ornament and use under the forming hand of the potter.

There are various clays of different values for manufacturing, from the decomposed beds of feldspar, which furnish the material for the costly and beautiful porcelain, down to the common blue and red clays adapted to the manufacture of the humble brown earthen, the invaluable drain tile, and the indispensable brick. The machinery necessary for the manufacture of ware is more or less elaborate and perfect, according to the position of the nation in the scale of arts and civilization. It may consist of the elaborate steam engine, the huge metalic grinding mill, the scientific turning wheel, and the roaring blast furnace; or it may all be summed up in a pair of human feet to tread the clay, a pair of human hands to mould the plastic material, and a rude pit for the purpose of subjecting the unburnt ware to the action of fire.

The foregoing cut represents the mill used in England for the purpose of reducing to a powder the dry lumps of clay which enter into the manufacture of stone ware. The apparatus is similar to that used in this country for crushing linseed in the oil mill, and consists of two huge iron wheels that follow each other in a circuit like horses attached to the power of a threshing machine. In the circular path of these two rollers, the lumps of clay are kept by a kind of scraper which follows each wheel, and draws the material directly into the track. The bed on which the wheels revolve is made of iron and pierced with small holes like a sieve, through which the crushed clay passes as it becomes reduced to a sufficient degree of fineness, and is caught in a bin underneath. From this bin the clay dust is removed either by hand or by machinery, and water added until the mass becomes a thick paste, when it is in fit condition to undergo the second grinding process. An illustration of the second mill and other processes in the manufacture of the ware, will be given hereafter.

ALEXANDER HAMILTON.

Opposed, as in many instances the constitutional views of Mr. Benton have been to those of Mr. Hamilton, that gentleman, in his "Thirty years in the United States Senate," pays the following beautiful tribute to his memory:

"He was the man most eminently and variously endowed of all the eminent men of his day; at once soldier and statesman, with a hand to execute; a writer, an orator, a jurist, an organizing mind, able to grasp the greatest system, and administrative to execute the smallest details; wholly turned to the practical business of life, and with a capacity for application and production, which seemed with gigantic labors, each worthy to be the sole product of a single master; intellect, but lavished in litters from the ever teeming fecundity of his prolific genius. Hard his fate, when withdrawing from public life at the age of thirty-four, he felt himself constrained to appeal to posterity for that justice which cotemporaries withheld from him. And the appeal was not in vain. Statues rise to his memory, history embalms his name; posterity will do justice to the man who at the age of twenty was "the principal and most confidential aid of Washington," who retained the confidence of the Father of his Country to the last, and to whom honorable opponents, while opposing his system of policy, accorded honor and patriotism, and social affections, and transcendent abilities."

QUESTIONS AND ANSWERS.

The *N. Y. Mirror* propounds the following interrogatory:

Why are men such cowards in their necessities?

Why will they not stand up and say, in the face of the world, 'I am poor but honest; I have been foolish but not criminal; I may fail to meet my engagements, but I will not fail to preserve my honor before men, and my integrity before God?

To which the *Day Book* makes the following response:

Why? Because poverty in New York is a greater crime than theft. Because to be poor but honest, is to cut oneself off from society, brand one's wife with that terrible curse, "not one of the first respectability."

To be "poor but honest," places one's children low in the social circle, deprives them of the visits of their friends, cousins, school-mates, and relatives, and stamps them "common;" prevents them from associating with their neighbors, and all others of the "first respectability." To be "poor but honest," and live economically, keep no horses and carriages, go to no parties, no operas, give no soirees, and not possess and enjoy the luxuries of wealth, is to deprive one of all that New York society says is worth living for. Better to steal or commit suicide than to live "poor but honest."

It is with glory as with beauty; for as a single fine lineament cannot make a handsome face, neither can a single good quality render a man accomplished; but a concurrence of many fine features and good qualities makes true beauty and true honor.—*Bruyere.*

Sunday Reading.

ECHOES.

Hark! through Nature's vast cathedral,
Blended echos ever rise;
Swelling in a mighty anthem
To its over-arching skies.

Every bird that sings in summer,
Every honey-ladened bee,
Every squirrel in the forest,
Every cricket on the tree;

Every music-dropping fountain,
Every softly murmuring rill,
Every dark and foaming torrent,
Every water guided mill;

Every rain-drop on the house-top,
Every bumble's noisy drone,
Every footfall on the pavement,
Wakes an echo of its own.

Sobs of woe and songs of gladness,
Each responsive echoes find;
Words of love and words of anger,
Leave their echoes far behind.

Every great and noble action
Is re-echoed o'er and o'er;
Life itself is but an echo—
Of the lives that were before.

(Written for the Rural New-Yorker.)

"SOWING IN TEARS."

"They that sow in tears shall reap in joy," are the words of the Psalmist; and in that one short sentence how much there is to cheer and encourage — to brighten the hopes — to strengthen the heart and prepare it for future trials. Often during the journey of life do we meet those along whose pathway the thorn and the thistle seem to spring up spontaneously. Care and sorrow darken their horizon, and their whole lives seem but one long, continuous struggle against adverse circumstances. Then how it gladdens the heart when we think, "they that sow in tears shall reap in joy." It may be the aged and decrepit grandsire leaning upon his staff for support, the man in middle life, or the young, the earnest-hearted, who, as he looks out upon the future, sees before him a long and toilsome journey, a wild and weary way.

Well do I remember one of whom it might be emphatically said that he "sowed in tears." I was a child when I first knew him, and he was then a gray-haired man, far past the meridian of life, who came occasionally to preach in the neighborhood where I lived. His kindness had won from all the appellation of father. The days of his boyhood and youth were spent in one of the British Provinces, and when manhood arrived his mind and manners were as uncultivated and as uncouth as those of the wild Indian; science and literature were sealed books to him, for he knew not one letter from another. In course of time his mind was awakened to the consideration of his eternal interests, he sought and obtained the pearl of great price. Then the work of the ministry seemed to be allotted to him, and he set himself about learning to read, and soon after with his family moved from his boyhood's home, and settled near the bright waters of the beautiful Ontario. There by the labor of his hands he supported his family, but he lost no time or opportunity of sowing the seeds of divine wisdom, of speaking of the boundless riches which he possessed. Thus he toiled on year after year, and in every place in which he labored, it seemed that the spirit of the Most High moved upon the hearts of the people. His language came from the heart, and it reached the heart, when with tears rolling down his furrowed cheeks, and with tones tremulous with emotion, he besought his hearers, as prisoners of hope, to turn to the stronghold. Then, too, the reaper Death stole into his domestic circle and left a vacant chair and sorrowing hearts, and anon his visit was repeated, and another heart grew cold and pulseless, another form was missed, another voice was hushed, for another had left the domestic circle, and had gone to "walk with the child of the angel wing."

Time has gradually deepened the furrows upon the old man's brow, has dimmed the brightness of his eye, has bowed his once strong, sinewy form, and added a thrilling tremulousness to his voice; and, one by one seems to be breaking the cords which bind him to earth, and it cannot be, that long time will elapse before the last sermon will be preached, the last prayer made, the last sigh heaved, the last tear dropped. A few times, perhaps, he will witness the rough, stern pleasures, the ruthless sway of winter, the joyous bursting forth of gladsome springtime, the rich luxuriance, the gentle reign of glorious summer, the deep thrilling quiet, the falling of the leaves in autumn; and he will depart, he will go hence, to be known upon earth nevermore; but shall he not be permitted to walk by the rivers of waters? Shall he not be redeemed and ransomed from the hand of him that was stronger than he? Ah! yes, he has sown in tears, shall he not reap in joy?

And as we look round, either upon the right hand or upon the left, numberless are the examples which present themselves to view.

I have seen the strong man who had learned to bow in meek and humble reverence to "the high and holy One that inhabiteth eternity," with tears beseeching his aged mother to turn her thoughts from earth—to lay up treasure in the mansion of the just—to be prepared to pass through the chill waters of the darkly rolling river which seemed but just before.—For more than three-score years and ten, that mother had been sustained, had been preserved from dangers seen and unseen, and as she had passed along, blessings had been scattered around her, profusely as flowers are strewn along the pathway of the conqueror; and yet they had no voice which spoke to her of better things than earthly pleasures. Long and earnestly did he plead with her then, for months, and perhaps even years were to glide by before he might enjoy a like privilege if, indeed, he should ever meet with her again in time. He, too, sowed in tears; but the promise is that he shall reap in joy; and from many a heart a deep earnest wish has gone out that the harvest may not be long delayed.

O, there are multitudes that sow in tears!—Go ask the teacher, the preacher, the parent, the friend; any one, in fact, in whose bosom there beats a philanthropic heart, and they will tell you that full many a time they have grown sad and sorrowful as they have contemplated the innumerable train of evils which need to be removed before mankind can occupy their proper station. That they have grown weary of contending with the sorrows of earth, with the blightings of youth, with the weakness of age, and that they would fain find a resting place where sin and temptation no longer spread their blandishments but, though weary they would not repine, they would fear no evil while the promise of the all-powerful One yet remained to them, for they know there shall come a time when toil and trial shall be past; when every hard experience that has been endured, every grief that has been borne, every hope that has been crushed and hurried in the thickly populated cemetery of the heart, shall be remembered only as at the distance of ages. And though many may have lived as pilgrims and as wanderers upon the earth—may have drained the cup of affliction to the very dregs—yet will their Heavenly Father be mindful of them, and a glorious harvest shall be given to those that have clean hands and pure hearts, for they have sown in tears, they shall reap in joy. M. C. M.

York, Livingston Co., N. Y.

A Solemn Thought.—It has been observed with much significance, that every morning we enter upon a new day, carrying still an unknown future in its bosom. How pregnant and stirring the reflection! Thoughts may be born to-day which may never expire. Acts may be performed to-day, the consequences of which may not be realized until eternity.

Miscellaneous.

MOSSES.

BY H. S. POWELL.

Is this lone spot of weedy mould,
Watched by no sad, regretful eye,
Mid matted herbage damp and cold,
An old forgotten graveyard lies.

A brier's thorny fingers keep
Each piece of broken slab apart,
And ancient mosses darkly sleep
On all its wealth of lettered art.

Here once were graven names and dates,
Affections, titles, triumphs, trust;
All that memorial lore relates
To grace the mute abandoned dust.

Beneath each green oblivious lid
What treasuries of sorrow lie,
In cankering rest forever hid,
While all the great world hastes by;

I linger, though the night is drear,
And each cloud shoots a fiery dart;
For sympathy begets no fear,
And moss is heavy on my heart!

The lichen of anguish pierce and fold
Each broken trust, and many a weed
Chokes up the warm and generous mould,
Where I had planted golden seed.

How many tender records, traced
In flowery rhyme on scrolls of white,
Sweet names with gilded wreath enchased,
There moulder, buried from the sight.

And o'er Joy's empty fountain frail
Dead lilies, spreading supplant palms,
And withered passion-flowers, pale
With pleading for affections' alms.

O, down these moss-grown ruins rest
Sealed treasuries of hope and tears;
There Love folds on its bloodless breast
The cold dreams of departed years.

There Memory o'er the falsely fair
Sleeps with her veil across her eyes,
And Fancy, palsied with despair,
Waves no bright pinion in the skies.

O Heart! a bitter wreath ye keep,
While round life's rosy currents flow;
But bury thy pale emblems deep,
And still smile on, for none shall know.

WHAT DOES IT AMOUNT TO?

"What does it amount to that a man toils and struggles to elevate himself above the level of common humanity?" remarked an individual who loved his ease, and was disposed to let the waves and winds roar and chafe around him, provided his own boat was left to glide smoothly over a glassy surface; "earthly fame is a bubble, wealth as evanescent as the morning mist, and life itself but a span. We occupy only for a brief space the places left us by our fathers, and are in turn soon superceded by our children. Look at the great names which politically, financially, and in a literary capacity, filled the columns of the press only a few years past. Where are they now? All gone! The crowd that hailed them with an *Io Triumphe!* have transferred their worship to other shrines; even their enemies have turned their hostile weapons against new opponents, and their very names are heard only as the dying echoes of a far off sound."

"A man of enormous wealth speeds onward through life's journey just as fast as the man without a penny, and when he dies, a mocking tablet is inscribed to his memory in stone, by those who make haste to inherit his fortune. He has his living out of his heritage, and perhaps that (not himself) received the passing reverences of the crowd, who in due time hurry him to his grave as speedily as decorum will permit, and then transfer their attentions to the heir at law."

There is a great deal of truth in the remarks of our friend, but there is a far nobler philosophy than that which says "eat, drink, and be merry, for to-morrow we die!" If a man could know just how much of this world's wealth would be sufficient to provide for the comfort of himself and those dependent upon him through life; to meet the calls of charity and philanthropy that may be made upon him; and then to leave his accounts with the world exactly balanced at the end of his career, it might do for an individual to stop at that precise point of acquisition; but it is wisely provided that such knowledge is hidden from our view. We can earn to-day, perhaps, sufficient to provide for all our wants; but to-morrow, sickness and casualty may come upon us, our employments may be taken away, provisions may rise in the market until our income will not meet our necessary expenditures, and then distress, the sure attendant of improvidence, will be knocking at our doors. Death may take us hence, and helpless children be thus left unprotected to the cold charities of the world. Hence the necessity of providing against contingencies, and laying aside more than sufficient to supply our own wants.

Nothing is lost by such a course, for common humanity is the gainer by every useful thing which an individual leaves behind him as a legacy; and every blow struck to subdue wild and unproductive nature to the use of man, or to garner up a surplus for his future sustenance, is a benefit conferred upon posterity. If every man was compelled to do for himself all that was done, if he was obliged to learn the sciences and arts without the lights shed upon them by those who have gone before him, hopeless darkness would forever enshroud his pathway; but taking up the thread of investigation where they have laid it down, he goes on to still higher excellencies, and leaves posterity all the richer by his own attainment. We owe something to the world besides just an equivalent for what we take from it—some surplus of physical substance or of intellectual wealth, that shall leave humanity the richer for our having lived and died.—It is not necessary that it be a great literary work or a mighty scientific discovery. It may be an elevating idea implanted in the mind of youth; an example to the world of integrity and moral worth; a humble invention that eases the labor or improves the condition of the poor. Even the hod carrier, who climbs with his burden to the tower of a new church, and the laborer who strikes his spade into the earth-work for a railroad, do something to enrich posterity and carry on the great work of human advancement and amelioration.

[Written for Moore's Rural New-Yorker.]

NATURE AND ART.

Nature and art go hand in hand, the one aiding and improving the other. Yet nature is far less indebted to art, than art to nature. Nature forms her objects after a model of her own, all grand and noble. Art is indebted to nature for her models; and the divinest perfection of all art, the masterpieces of genius, are but copies of nature. Nature, though expressive of grandeur and richness, often presents a roughness and wildness, and here art steps in, and beautifies and adorns. Under the guiding hand of art, grandeur flows into sweetness and loveliness; the roughness is chiselled down and ornamented by taste. With this change a result is obtained not at all times desirable; for weakness takes the place of strength, and though there are beauty and loveliness to admire, yet the objects which suggested sublime thoughts and conceptions are not present.—Though nature is often refined and beautified by art, yet in her noblest works she stands aloof from all embellishment. For what charm can art lend where ceaselessly foams and thunders the cataract? How can it adorn the mountain's peak, that stretches into the upper light? By what magic can it transform forests and groves, plains and vales, into scenes of a more varied beauty?

True, there is a beauty in utility, ever present to the practical mind, but unrecognized by the artist. The forests may be converted into fruitful fields, the groves made to accord more to the rules of art and *artificial* taste, the plains covered with rich verdure, and enamelled with wild flowers, become the abode of teeming industry; the smiling vales, where on either hand are gentle slopes of green and mild declivity, flowing rills of gushing water, whose banks may be clothed with the luxuriant corn, or afford pasturage for numerous flocks and herds. A transformation like this would be pleasing to the utilitarian, but the spell which bound the artist-mind, and connected it by nature to nature's God, is broken.

Hence we see, that art cannot improve nature in her grandest works. Nor can the most exquisit skill and finest touches of art add a line of beauty or a trace of loveliness to some of the more elegant and delicate of nature's works. What in colors can art present equal to the gorgeous beauties of the rainbow's tints, or the fading rays of the setting sun? By what means can it add brilliancy to their beauty, or ornament to their simplicity? How can it give a richer dye to the deep blue of the sky, or cause the clouds to assume a fairer shape? These are beyond the power of art. Here it can claim no dominion. The clouds assume the most fantastic and the most interesting forms possible; the azure of the sky is the best; the tints of the rainbow are the finest and most agreeable.

The difference, then, between nature and art is simply this: that nature, though for purposes of utility, is often improved by the refined and cultivated hand of art, yet in her greatest and fairest works, where grandeur and sublimity, beauty and simplicity prevail, are independent of art; but art, wherein it excels in great or beautiful works, is more or less indebted to nature. There is no work of art, however excellent, whether of painting or statuary, music or poetry, but had its more glorious anto-type in nature. A. J. E.

Greek Tombs.—At Canusa, *(Canusium,)* in Apulia, the excavations of Greek tombs have been continued. These tombs are in the form of small chambers, with columns and paintings, and are found to contain gold ornaments, consisting of collars, bracelets, diadems, earrings and rings, together with arms and vases. On the latter are designs of great beauty, representing on a black ground red figures of animals and birds, &c. These vases are supposed by some to be Egyptian, by others Babylonian. At Capua, excavations have led to the discovery of a tomb in the form of a chamber, with several paintings of women playing on fifes and other figures.

Day begins in darkness, grows bright, strong and glorious, and in darkness closes; and so man begins life in weak childhood, attains to the meridian of manhood, and second childhood ends his day career.

CHARACTER VS. WEALTH.

One of the most important lessons to be impressed upon business men, and especially upon young men who are seeking their fortune, amid the intense competitions of city life, is a sober estimate of the value of character above wealth. It is natural to men to create factitious distinctions in society. In every form of political society, except the republic, such distinctions exist by birth or in permanent civil and ecclesiastical orders. Pride is nurtured and vanity gratified by blood, or family, or title, or inherited rank. But such distinctions are precluded in a republic, by its very constitution. Hence there remains but one basis of social distinction, namely, wealth. In limited circles, indeed, there may be an aristocracy of talent, of education and refinement, of literature or science, but in society at large, gradations of social position are measured by stark certificates, rent-rolls and bank-accounts. In the old world a patent of nobility holds good, though there is no income adequate to sustain it; and a penniless count stands higher in the social scale than the untitled millionaire. Here the appearance of wealth is the passport from circle to circle. Office is uncertain, and does not always dignify the holder. It cannot be retained for life, much less be transmitted to descendants. Hence wealth has gained an importance far beyond that which belongs to it where it is used only to keep up an estate, to display rank, to enjoy life, to procure the advantages of education and travel. Here it creates rank; it gives social position, even without antecedent respectability or correct education; and hence pride and vanity, that in other countries have so many and various outlets, here crowd into this one channel, and either fill it to its utmost level or agitate it with eddies and contentions waves.

In this city especially, the feeling is universal that to be any body or to do anything one must have wealth. New York is as full of idols as Athens was when it was easier to find a god there than a man; nor do the objects worshiped in the two cities differ in form.—For what do men here worship if it be not stocks and stones? With wealth in view as the one great object in life, upon which everything else depends, it is not strange that many grasp at the prize without any scruple as to the means.

In the upper circles of fashionable life no questions are asked how one came by his money, if he only shows that he has money or appears to have it. If he lives in a fine house, keeps a good carriage, gives splendid parties, no questions are asked as to whether all this is honestly paid for. With such a standard before them, it is not surprising that aspiring men, who feel themselves in other respects the equals if not the superiors of their wealthy neighbors, should find some short road to wealth. The passion for riches, the idea that success in life depends mainly upon wealth, is fruitful in temptations to dishonesty. "For they that will be rich fall into temptation and a snare, and into many foolish and hurtful lusts, which drown men in destruction and perdition; for the love of money is the root of all evil; which, while some coveted after, they have erred from the faith, and pierced themselves through many sorrows."

This is the maelstrom of character in our city. Men will be rich, they must be rich; they put forth on the sea of speculation; they reach after every floating straw of prosperity, they give themselves to the guilty passion of money-getting, and are whirled everywhither by its power. Smoothly they ride at first on the giddy outskirts of dishonesty, till, infatuated with the pursuit, they dive deeper and deeper, and are sucked into the mighty vortex—a wreck of character, fortune, hope and life.—The only safeguard is to hug the shore of honesty. Make *character* supreme.

So strong is the infatuation of wealth among us; such the glare of wealth above character; such the imputed disgrace of poverty, that even feminine delicacy will come out from the retirement of private life to resent the imputation of poverty before marriage as a greater grief than a husband's friend; and the newspapers must publish to the world that, whatever robberies a man may be charged with, his wife was never guilty of the stupendous crime of being "a poor girl." We transgress no rule of propriety in thus adverting to what is matter of public advertisement. We offer no censure upon individuals. But is it not pitiable to see from such voluntary exposures of high life, how wealth and character stand respectively in the estimation of many who make our society? The influence of such false pride is baneful in the extreme. Is it not worth to any woman more than gold to say, "However poor I or my family may have been, my husband is an honest man?"

Ages of the People.—Owing to the increase of births in England in recent times, by which the proportion of children and young persons has been raised, it is considered doubtful whether the people of any country in Europe are so young as the people of Great Britain. But in none of the great European nations have the ages been enumerated with any degree of completeness; in France and in Russia they have never been stated at all.—The following table shows the population of Great Britain in 1851, classed according to the natural divisions of life; but of the women under 20, 25,607 were married:

Babes and sucklings—under one year,	576,743
Infants—1 to 5 years,	2,166,436
Children—5 to 10 years,	2,450,066
Boys—10 to 15 years,	1,141,933
Girls—10 to 15 years,	1,114,552
Youths—15 to 20 years,	1,051,030
Maidens—15 to 20 years,	1,018,401
Young men—20 to 30 years,	1,830,558
Young women—20 to 30 years,	1,939,006
Middle-aged men—30 to 60 years,	2,810,904
Middle-aged women—30 to 60 years,	2,487,382
Elderly men and women—50 to 60 years,	1,457,618
Old—60 to 70 years,	949,670
Very old—above 70 years,	500,030

It was a pertinent and forcible saying of the Emperor Napoleon, that "a handsome woman pleases the eye, but a good woman pleases the heart. The one is a jewel, and the other a treasure.

Ladies' Department.

CONDUCTED BY A——E.

[For Moore's Rural New-Yorker.]

LINES,

To Little Delia, on her Recovery from Illness.

BY ANNA M. LANGELAND.

A shadow from the death-wing,
Hath flitted o'er thy brow,
But the shadow hath vanished
Health's smile returneth now.

Perchance thou hast had glimpses
Of angels'arm fling near,—
Had seen their radiant faces,
Undimmed by pearly tear.

Perchance that in thy dreamings,
Thou'st heard the rustling sweep
Of seraph pinions near thee,
That guard thee in thy sleep.

For if there are revealings,
To earth of heavenly angels,
I know that they are given
To children—God's evangels.

Tho' the shadow hath vanished,
Yet thy brow is pale as death,
And thro' thy gentle slumbers
I scarcely hear thy breath.

Yet I know the blessed Father,
Hath heard the earnest cry,
Of those who watch around thee,
And Health's pinion passeth by.

The gracious Father giveth thee
A fair and beauteous face;
I would that there earth-shadows,
No darker hue may trace.

I trust that blushing womanhood
May find thee still as meek,
With the lily on thy forehead,
And the rose-leaf on thy cheek.

I bless the Gracious Giver,
For each ray of beauty left,
Free from sorrow's arrows,
And Time's unceasing theft.

HOW TO AVOID CONSUMPTION.

That consumption, when once seated, is incurable, has long been the verdict of the medical profession. The right way, therefore, is to avoid taking it. Nor is this so difficult a matter as is generally believed. Even when consumption has attacked a person, but has not become seated, its cure may be affected by a strict attention to diet and exercise, as was proved in the case of the venerable Dr. Parish, one of whose lungs was found cicatrized after his decease, as he had foretold it would be.—How much more easily, therefore, may its access be prevented! If we avoid those things that conduce to it, if we fortify our body against its approaches, we are almost sure to secure exemption from it, even though, perhaps, constitutionally disposed to the disease.

It is amongst women that consumption finds most of its victims in America, as might be expected from their almost universal indifference to the preservation of health. The neglect to dress with sufficient warmth, or suitable to the season, is a general error of the sex. If the new winter cloak is not bought, when a cold spell suddenly comes, the full mantilla is still worn, because the last year's cloak is out of fashion. Though the same foolish vanity a light bonnet is continued when the temperature imperatively demands a thick, warm one. Can it be wondered at, if colds are caught?—Or, when this mad conduct is persisted in year after year, that a series of colds end in consumption? There is one fatal habit of the sex, which has often been commented on, but, alas! in vain; we mean the wearing of thin shoes. The thickest gaiter worn by a woman, on the dampest day, is proverbially thinner in the sole, and lighter in the uppers, than the summer boot of a gentleman. Yet of the two sexes the female is not the hardiest by nature. Even when women wear gum over-shoes, on slushy or rainy days, there is nothing to protect the ankle from the wet skirts. A man who should keep his feet and ankles damp continually, as ladies do theirs, in fall, winter and spring, would very soon be in his grave!

But this, though perhaps the most fatal, is not the only careless habit of which rich females are guilty. The winter balls, with which every large city and even every rural district is overrun, offer opportunities for women to destroy their health, of which they would seem to avail themselves with malice prepense. As if the late hours, the indigestible suppers, the excessive excitement, and the over-crowded and ill-ventilated rooms were not sufficiently deleterious, they allow fashion to dictate to them a mode of attire for such festivals, which is almost certain provocative of colds, those foster-mothers of consumption. A ball dress, alike in its flimsy material an the style in which it is cut about the shoulders, is the very worst costume a woman can wear at a dancing party. If she participates in the amusements of the evening, she is sure to become heated.—She is almost as sure afterwards to rush to a window, or into the hall, in order to cool herself. The consequences are that the pores are suddenly closed, and cold and fever superinduced. Under any circumstances such conduct would be perilous. But with a ball dress on it is almost certain danger. Four or five seasons like this would sap the health of a giant. Is it strange that it carries off so many of the young and beautiful?

There are still other causes for consumption. Some of these are such as are little expected. Hundreds of women die annually, for example, for the want of fresh air. American females live proverbially too sedentary a life. Their time is spent in close, hot rooms; and often they do not take exercise enough; it is certain that, as a mass, they neglect inspiring exercise in the fresh out of door air. Many a wife and mother who is fully awake to the folly of fashionable ball dresses, or even to the neatness of their shoes, yet sacrifices her life by sitting all day within doors, and often during winter in over-heated rooms, and breathing impure air into her lungs. A cold, accidentally caught, perhaps without any fault of the victim, is often an almost certain precursor of consumption to such a woman, enervated by in door life as her constitution is.

It is the common cry that the variableness of our climate is the common cause of so much consumption. But quite half the mortality from this disease might be avoided, if the laws of life and health were oftener obeyed, especially by the female sex. An old proverb says that an ounce of preventative is worth a pound of cure. In consumption, it is worth two of cure, for there is really no cure, and therefore prevention is everything.—*Phil. Ledger.*

"I WILL BE HOME SOON."

The insignificant word-couplet, "All aboard!"—uttered thousands of times every day, in depots and on docks—is always the prelude to a long psalm of sorrow. Of itself, it is a mere business behest; in its hearings, it involves regret, suffering, and, oft-times, despair. Not an hour glides into the great sea of the past—not a moment leaps to the surface, and then is lost forever—but some ear listens to its knell for the last time!

If your heart has become dissatisfied with its treasures, and you are disposed to grope amid the shadows of despondency, go where friends are parting. We do not know of a surer recipe for re-kindling the flames of sympathy, than this. No one with even a fragment of a heart in his bosom, can see the warm embraces of those who are to go and those who are to stay, or hear the tremulous but earnest "good-bye" and "God bless you," uttered by lips that tremble with the freightage, without a blessing of his own.

A few weeks ago we were the witness of a parting which touched us nearly. It was between two who were newly wedded, and who, since the sweet day of their nuptials, had not been parted for a day—hardly for an hour.—Nothing short of sheer necessity could have called the husband from his idol now—but the necessity came between them, and he must not shrink. We saw the long and wild embrace, heard the poor whisper "Be of good cheer—I will be home soon"—and in a few moments more the billows rolled between the hearts that so lately God had joined together.

"I will be home soon." These were the words—the only consolation left, amid so much bitterness. Perhaps the pangs were sharpened by the vague presentiment that they might never meet again! And so she turned from the spot, that sad young wife, and went back to the home whose light had departed.

"I will be home soon." And so he was; home before he was expected—home ere yet the tears were dried from the eyes of the weeper whom he left behind. But alas! how did he come? Encompassed by a shroud, embraced within a coffin, cold as the perpetual snow that crowns the monarch mountain of Switzerland. Sure enough—he was "home soon."

They dug but one grave then—but, since, another was demanded—and, now, the young husband and the young wife sleep and dream together.

We shall all "be home soon." What that home will be rests with us. The deeds of virtue will secure a passport to golden palaces—the enormities of vice will end in worse than dungeon darkness.—*Buff. Express.*

DON'T STAY LONG.

"Don't stay long, husband," said a young wife tenderly, in my presence, one evening, as her husband was preparing to go out. The words themselves were insignificant, but the look of melting fondness with which they were accompanied, spoke volumes. It told the whole, vast depths of a woman's love—of her happiness when with her husband—of her grief when the light of his smile, the source of all her joy, beamed not brightly upon her.

"Don't stay long, husband!"—and I fancied I saw the loving, gentle wife, sitting alone, anxiously counting the moments of her husband's absence; every few minutes running to the door to see if he were in sight, and finding that he was not, I thought I could hear her exclaiming in disappointed tones, "not yet—not yet."

"Don't stay long, husband." And again I thought I could see the young wife, rocking herself nervously in the great arm chair, and weeping as though her heart would break, as her thoughtless "lord and master" prolonged his stay to a wearisome length of time.

O, you that have wives that say, "Don't stay long," when you go forth, think of them kindly when you are mingling in the busy hive of life, and try, just a little, to make their homes and hearts happy, for they are gems too seldom found, and when lost too seldom replaced.—You cannot find amid the pleasures of the world the peace and joy that a quiet home, blessed with such a woman's presence, will afford.

"Don't stay long, husband!"—and the young wife's look seemed to say, "for here, in your own sweet home, is a loving heart whose music is hushed when you are absent—here is a soft breast for you to lay your head upon, and here are pure lips, unsoiled by sin, that will pay you with kisses for coming back soon."

Think of it, men, when your wives say to you "don't stay long,"—and oh, don't let the kind words pass unheeded as of little value, for tho' they may be to you, the disappointment or the fulfillment of their simple, loving wish, brings grief or joy to them. If you have an hour to spare, bestow it upon them, and the pure love, gushing from their gentle, grateful hearts, will be a sweet reward.

The hearth is childhood's seminary. 'Tis here that the important duties of life are learned. 'Tis important because it is universal—the dreariest cot in all the land has its sacred hearth. The maxims here inculcated become woven with the woof and web of after-life, and give it color, texture and form.

Kindness kindles the fire of friendship.

MOORE'S RURAL NEW-YORKER

ROCHESTER, OCTOBER 28, 1854.

Short-Lived Glory.

The Baltic's advices of the unprecedented successes of the Allies in the Crimea, have proved to be as baseless as "the fabric of a vision." Rumor, like the lying jade she ever proves herself to be, has played a real trick upon our transatlantic neighbors; for it turns out, after a vast expenditure of jubilant patriotism in England and France, in which also our Canadian neighbors joined, that Sevastopol has *not* been taken, 20,000 Russians have *not* been killed, 22,000 have *not* been made prisoners, 800 guns have *not* been captured, 10 ships of the line have *not* been sunk, and, in fact, the whole story is a sheer fabrication, or at least one having very slight foundations.

The Allies have landed in the Crimea and quite a battle has been fought, in which the Russians were defeated and driven back upon Sevastopol, which is reported to be invested both by sea and land. The latest dispatches from Marseilles, Oct. 5th, brought by the steamer Fury from Constantinople Sept. 25th, state that the second line of defences had been carried, and that the siege was progressing, but without any absolute impression being made as yet upon the main body of the works.—That Sevastopol will fall is quite probable; but the premature announcement of its capture, was a cruel hoax upon the English and French people, and placed them in an extremely awkward and ridiculous position.

Fate of Sir John Franklin.—The painful mystery that has so long hung over the fate of Sir John Franklin, has at last been solved, and the fact fully established that the whole number of persons composing the expedition have perished.

Dr. Rae has written from York Factories, under date of Aug. 4th, to Sir George Simpson, Governor of the Hudson Bay territories, announcing the discovery of the remains of the expedition, and stating that they started to death as long ago as 1850. The facts were obtained from Esquimaux who were cognizant of the circumstances. "No doubt" adds the Dr. "is left of the truth of the report, as the natives had in their possession various articles of European manufacture, which had been in possession of the whites, among them were several spoons, forks, &c., on one of which is engraved, "Sir John Franklin, K. C. B.," while the others have crests, and initials on them which identify the owners as having belonged to the ill-fated expedition.

Good for Wine Bibbers.—The importing agent of the famous Schrieder Champaign, recently prosecuted a *home manufacturer* of the article in New York, for falsely imitating and counterfeiting the genuine labels, and then greatly underselling the importer. It came out on trial, that Jersey cider is manufactored into Champaign, and sold in large quantities. Old bottles are collected from the hotels, and refilled with *impure juice of the apple*, and sold to green ones, at $2 per bottle, as *pure juice of the grape*. No one, it may be, puts *new wine* into old bottles, but there are a great many manufacturers of spurious liquors who put *new cider* into old wine bottles.

The Boston *Chronotype* once said they saw in the street a pile of rubbish which they would have mistaken for logwood chips, but were convinced it must be grape pomice, from the fact that the building near by was a wine manufactory.

Another Douglass in the Field.—Frederick Douglass' Paper announces that "the Editor is just commencing an arduous campaign in the State of Illinois." It is presumed this "arduous campaign" is political in its nature, and that the celebrated Freemen takes the field against Stephen A. and Nebraska Bill. It must be a rich treat to hear the champions of extreme anti-slavery and slavery doctrines contending against each other. Frederick Douglass reverses the old Roman's advice, to carry the war into Africa, and in his own person causes Africa to carry the war to Rome.

Whig Convention of Monroe.—The Whig County Convention met at the Court House in this city on Saturday last, and renominated Dr. Davis Carpenter for Congress. The *American* of this city bolts the nomination, saying, among other things, "it is in all respects a nomination unfit to be made," and refuses to place the name of the nominee at the head of its columns. The remainder of the county ticket is as follows: For Treasurer, Lewis Selye, of Rochester; for Superintendent of the Poor, Addison W. Dorfee, of Rochester; for Justice of Sessions, John K. Beebe, of Perinton.

A Scandalous Outrage.—Twenty or thirty rowdies in Ellsworth, Me., recently tarred and feathered the Rev. John Bapst, a Roman Catholic clergyman of Bangor, and formerly a resident of Ellsworth. The only alleged offence of the priest was that he had at one time been engaged in a school controversy which led to a law suit, and that certain parties had threatened him with personal violence if he ever returned to the place. It was stated last week that he had died from the effects of injuries received but the rumor is not well authenticated.

Jack Frost.

We have had occasional touches of frost for many weeks past, sufficient to tear the leaves and give to vegetable creation the symptoms of decay; but the bitter, blighting effects of the hoary old destroyer has not been felt in all its blasting power until Wednesday evening of last week. The sky was calm and clear, and the white rime came down, settling in a thick coating upon leaf and flower, and prostrating the glories of Autumn vegetation in the dust.—Many a vine and shrub that was flourishing in green luxuriance the day previous, was blackened by the touch of Jack Frost's all-destroying finger. Ice formed in the open air, which in shady places did not melt away until a late hour of the following day.

Since that time we have had a succession of glorious days, which is a partial remuneration for the severity of those nights; but the warning cannot go unheeded, that Winter is treading close on the heels of retiring Autumn. Besides the frosts of the week, there was a slight sprinkling of snow, not sufficient, however, to lay upon the ground or show white upon the house-tops. The birds have mostly departed for more genial climes, and those yet lingering are collecting together preparatory to a hasty migration. They have not during the past summer wholly shunned even city limits, and many a shady walk along our streets has been enlivened by the presence of the robin, the blue bird, the sparrow, and other wild-wood songsters.

Arrival of the Asia.

The Royal steamship Asia, from Liverpool, arrived at New York on the 20th. Her files are principally taken up with counter statements in regard to the false news brought by the Baltic relative to the fall of Sevastopol.

The London correspondent of the *New York Tribune* accounts for the origin of the false report as follows:

A Tartar—that is to say, a Turkish postman—had arrived at Bucharest with dispatches from Constantinople for Omer Pasha, which, as the General was absent, had to be sent to him unopened—therefore we don't know their contents. But the postman related that at his departure from Constantinople the town was illuminated, and that orders were given to continue the illumination for ten days. He concluded, therefore, that Sevastopol was taken, and gave just such details as a Turkish or London postboy could give in a pothouse. He mentioned 18,000 Russians killed, but only 200 guns taken, though the forts contain above 500 guns; 22,000 Russians were of course prisoners, since it was known that the garrison amounted to about 40,000. The fleet was first taken; then again a portion of it was destroyed, and Prince Menschikoff was on the point of blowing himself up with the remainder, &c., &c.

A private dispatch in reference to the battle of Alma says that the English loss was nearly 2,000 men, that of the French was but 1,400, but Gen. Bonet was killed. The Russians numbered 40,000 men and 100 cannon, and their loss is variously estimated at from 6,600 to 10,000, the former being probably the more correct. Early in the day Menschikoff had but 25,000 in his entrenched camp on the Alma; but having learned by his scouts that the Allies were in such force, he brought up 15,000 more from Sevastopol. A large number of Poles deserted to the Allies.

Sevastopol was invested on the 27th. The second line of the defence was carried, and the place entirely surrounded. The Russians are shut up in the fortress, which was to have been attacked by sea and land. One account states that the Russians had some eight line-of-battle ships at the entrance of the harbor; another account says four.

Does a Sinking Ship Produce a Whirlpool?—A writer in the *New York Evening Post*, under the above caption, alleges that the common idea among sailors and others, that a sinking ship causes a tremendous vortex sufficient to swallow up everything within reach, is a fallacy. He says this popular delusion was one of the causes why the Arctic was deserted by her crew, and the boats so early and hastily pushed off to a distance from the ill-fated steamer.

In proof that a sinking ship does *not* cause a whirlpool, the writer gives a chapter from his own experience, as follows:—"I was in a vessel which capsized some years since, and with others got upon her bottom. Her boat was cut from the wreck, and as she sunk some of the old sailors (who had the chimera in their heads) plunged overboard and struck off to clear the 'whirlpool'—the *less* experienced ones stood upon the vessel's bilge until the water slowly rose to their shoes, and then got into the boat without wetting their ancles!"

A Costly Advertisement.—The *N. Y. Weekly Tribune* charges fifty cents a line for advertising, and its columns are filled at that. A recent advertiser paid that paper, for a single insertion of a long advertisement, *eight hundred and sixty-one* dollars; the largest sum ever paid for a single advertisement in this country; and yet the advertiser probably considers it, and truly, to be the best investment he ever made for the purpose of giving publicity to his business.

Widely circulating papers are the best medium for advertising, even at higher rates, and one insertion in a paper which circulates twenty-five to thirty thousand copies, like the Rural New-Yorker, is equivalent to fifty insertions in a paper that circulates but five hundred.

Choice Seeds.—Messrs. Watsons and Ducos, advertise in this number a variety of choice Melon and other seeds. The three varieties first named in Mr. B.'s list are superior, as we can attest from recent experience, and presume those of friend W. are also worthy of trial.

Forest Leaves from the West.—No. 1.

Battle Creek, Mich., Oct., 20th, 1854.

Friend Rural:—Once more in this Western land of promise, we are viewing the changes of one long year. It is really pleasant to mark the progress and improvement that this wondrous age effects in so short a space of time. Michigan is fast becoming an old State—fast rolling back the forest curtain, and converting its rich alluvial soil into fine farms.

On the evening after leaving your comfortable "Sanctum," we went aboard the steamer Plymouth Rock, of the Michigan Central Line. We had a pleasant sail to Detroit, with nothing to mar the pleasure of our trip, until we entered Detroit river, where we met the Western World with flags at half-mast, which is the signal of *death*. The boats were stayed sufficiently to ascertain that Captain Stannard, of the Western World, was dead, and his remains were on board for the reception of his family and friends at Cleveland. At Detroit we learned the particulars of his death. He seemed well up to the moment he was to leave on his downward trip. He was ringing the bell while the boat was turning in the river, when he exclaimed to his mate, "lend to her," and fell backward, and was caught in his arms *lifeless*. Capt. Stannard was said to be the oldest commander on the Lake, as well as an excellent one.

At Ann Arbor we made a short stay. The University of Michigan has just begun its fall term, and its Freshman class is the largest it has ever commenced with. This is the only institution we know of which offers to the student, from any part of the Union, an education, literary and professional, *free* of charge; it also has an able faculty in the departments of Literature, Medicine, and Agriculture, and is pleasantly situated in the city of Ann Arbor, forty miles west of Detroit, on the Michigan Central R. R.

An Astronomical Observatory is nearly completed, at a cost of several thousand dollars, which is a very important consideration to the student, connected as it is with the University.

Wheat on the ground looks fine. Potatoes are plenty in this section of the State, at three shillings per bushel. It has been very dry with them here, but nothing severe. Corn is a fair crop. The wool trade is extensive and good.—As far as my observations could extend, the wheat looked fine through the State in this place. The present crop is fair, but not as large as anticipated before harvest. It is selling to-day at $1,25 per bushel. It has been higher, ($2,) but only for a few days, just before, and shortly after, harvest.

Real estate has advanced beyond all precedent within the past year. Fine improved farms, with good buildings, orchards, &c., are held at from $30 to $50 per acre, on the Central Road.

You will hear from me again on the Grand River. Frank Forest.

Jail Delivery without the Ayer.—Arthur C. Nelson, of Kreseville, late Editor of the *Kreseville Democrat*, and Postmaster of that place under the appointment of President Pierce, was recently detected robbing the mail, and confined in the Troy jail, awaiting trial therefor before the U. S. District Court. On the night of the 15th inst. he made his escape by means of a small saw and a rope, with the former cutting off the gratings, and with the latter let himself down from the window of his cell. Before attempting to escape, he induced a fellow prisoner, who complained of being unwell, to take a dose of "medicine"—giving him chloroform, from the effects of which the patient did not recover until morning.

He left behind a very complimentary letter addressed to the sheriff, thanking him and others for personal favors, and requesting that the effects he left behind, and any letters that might come to him, should be sent on to his friends at Plattsburg.

Perils of the Sea.—The Rev. Henry Ward Beecher, in his recent sermon on the late shipwreck of the Arctic, made the following startling declaration:

"During the past twelve months, more than 4,000 American vessels, including those on the lakes and rivers, have been lost. This is no Minister's calculation, who are not expected to know anything of such matters, but has been computed by those who are expected to feel these losses most severely. During the same length of time, the number of vessels lost throughout the whole world was 10,000. Can it be said that it was chance alone that has caused the United States to furnish 4,000 out of the 10,000 that have been lost? Up to the year 1850, the average number of vessels lost all over the world, averaged 3,000 a year. The amount of insurance paid by the Marine Insurance Companies in New York, last year, amounted to twelve millions. The losses on land by railroads and otherwise, amounted to eighteen millions, making a total loss by sea and land, to be thirty millions of dollars."

A Mischievous Parrot.—The Albany *Transcript*, probably on the authority of some of its Boston correspondents, tells the following tough story in ornithology. The narrator does not say whether or not that bird lived to an extraordinary old age:

"In Boston, a parrot that was kept aboard a ship, was much interested in watching the drays that came to leave goods on the wharf. One day the driver of a dray left his team and went down to the cabin of a ship. The parrot watched him, and, when he was out of sight, began to imitate his talk to the horses. 'Whoh! back there—back, I say!' said the bird. The horses backed; and the parrot, encouraged by the success of his experiment, continued to scream,—'Back! back I say!' until the team backed over the wharf into the water, and one of the horses was drowned."

News Paragraphs.

☞ In September last a box of fulminating mercury was found buried beneath the track of the railroad between Lilly and Tournal, in France. The mercury, which possesses an explosive force thirty times stronger than gunpowder, was connected with a wire which extended a long ways beneath the sand. The apparatus was without doubt intended by the agency of electricity to blow up and destroy a train of cars.

☞ A physician writes to the editor of the Louisville Courier, that a few days ago, "a young lady of Oldham county, in her ordinary health, (perfectly well, the family says,) rode two miles to a physician and had a tooth extracted. Almost immediately a paralysis on one side of the body occurred, then spasm, and death followed in a few hours." She had not inhaled chloroform, or anything of that kind.

☞ Archbishop Whately has succeeded in establishing a society for the protection of the rights of conscience; the object of which, it appears, is to find employment for those persons in humble condition in Ireland, who are turned out of work for their religious opinions, or to provide goods at reasonable prices for those who would otherwise be practically taxed on account of their religious opinions.

☞ Some of the MSS. of Arago, containing 2,956 pages of writing, of which 2,599 are by his own hand, have lately been presented to the French Academy of Sciences. They contain observations upon magnetism, and the results of 73,000 experiments in that science. A committee has been appointed to examine these papers, with a view to their publication in the Memoirs of the Academy.

☞ Rev. Dr. Ives, late Episcopal Bishop of the North Carolina who went over to the Roman Church, returned to this country by the Canada and is now sojourning in New York with his brother-in-law, Rev Dr. Hubart. The *Times* states that he has been kindly received by all his old friends, as well as those newly found in the Catholic Church.

☞ The New York Evening Post says that nearly every railroad company is postponing its usual half-yearly dividends, needing the receipts of the road for discharging expenses of new works of improvement entered upon before the change in the money market was evident, and for which they cannot now borrow money.

☞ Nine thousand men continue to work incessantly at the fortifications of Cronar, which place it is intended to make one of the strongholds of the Russian empire. It will be some years ere the works are complete. The advanced works extend nearly five English miles beyond the city.

☞ The dead letter bureau of the Post Office is now making up and transmitting mails to their respective countries as follows: For England, 30,000 letters; Canada, 7,000; Nova Scotia, 850; New Brunswick, 600; Bremen 6,000; and for Prussia 2,000. All three letters are thus returned unopened here.

☞ The Cardinal Vicar of Rome has issued an edict in which, after attributing the cholera to the sins of the Romans, he directs that the finger of St. Peter, the arm of St. Roc, the heart of St. Charles, and other relics, shall be exposed to the adoration of the faithful, in order to avert the wrath of the Almighty.

☞ Moses Stebbins, of South Deerfield, Mass., has an apple tree which was planted about one hundred years ago, is eighteen feet in circumference near the surface of the ground, covers an area by its spreading branches of about seventy feet in diameter, and bears a sweet apple.

☞ One of the escaped seamen of the Arctic shipped on board the Atlantic on Saturday week. Just as the steamer was about to sail he was discovered by Captain West, who took him by the collar and marched him ashore, saying he wished no *such* men to go to sea with him.

☞ The American *Celt* advises adopted "citizens" not to vote at all at the coming election except in two cases, 1st, when it is *certain* from figures that they can give a majority against the Know-Nothings, and 2d, when a candidate has reluctantly declared against the Know-Nothings.

☞ Fifty years ago a celebrated mode in Massachusetts of curing the insane was to whip them severely and then immerse them in water until they were insensible. It was claimed that they would recover their consciousness and sanity at the same time.

☞ Col. John Allen, of Louisville, publishes a card stating that a fillibustering expedition, which has been organized there for some time past, numbering 15,000 persons, has been disbanded. The cause is stated to have been a want of means.

☞ Among the ladies who have achieved the ascension of Mont Blanc the past season, was a French woman, who, after reaching the summit, caused herself to be lifted upon the shoulders of her guides so that she might be able to boast of having been higher than any man in Europe.

☞ A most singular and fatal occurrence took place at the Sorrel Horse stable, Philadelphia, on Saturday. A man named James Pollock was bitten in the neck by a horse, and his windpipe being severed, he died soon afterwards.

☞ Pennsylvania, Ohio and Indiana have just chosen fifty-seven members of the 34th Congress, and out of the number only four are Nebraska men. These are all from Pennsylvania. Ohio and Indiana are a "unit."

☞ The Common Council of Chicago have passed an ordinance authorizing the Mayor and City Clerk to close a contract with the American Submarine Tunnel Co. for the construction of a cast iron roadway under Chicago river.

☞ Hon. Jacob Collamer, Gen. Taylor's Postmaster General, has been elected U. S. Senator from Vermont for six years, and Hon. Lawrence Brainard, free soiler, for the vacancy which S. S. Phelps tried to fill out.

☞ Six mills in St. Louis ceased operations on Saturday week, in consequence of having no wheat to grind. The millers are unwilling to buy wheat for flouring at present relative prices of wheat and flour.

☞ The Russian journals announce that the celebrated aquatic plant, from the river of the Amazons, the Victoria Regia, has commenced flowering in the hot-houses of the imperial botanical gardens at St. Petersburg.

☞ Joseph Warren, Esq., of the Country Gentleman, and Secretary of the Albany County Agricultural Society, is about going to Buffalo to take the Editorial charge of the *Courier* in that city.

News Brevities.

—— The human heart gives 96,000 strokes every twenty-four hours.

—— Rev. Dr. Jennings, one of the founders of the Methodist Church, died at Baltimore on Thursday week, at the age of 84.

—— There were 950 passengers on a single train of the Great Western (Canada) road on Wednesday week.

—— A jeweller in Paris intends to exhibit at the Grand Exhibition next year, a silver statue of the Emperor of France, as large as life.

—— Col. John O'Fallon, of St. Louis, received last year for rents, $151,000. He is just as well off as though he was a rich man.

—— All the Maine papers are loud in the expression of their indignation at the late outrage upon a Catholic priest at Ellsworth.

—— The wife of Samuel Oliver, of Waterville, was burned to death on Friday by her clothing taking fire from a lighted match.

—— Levi Lacy, Esq., an old resident of Wheatland, died on Friday evening week, at his residence near Scottsville.

—— The Kennedy Clock Factory, at Southington, Ct., was destroyed by fire on Friday week. Loss $30,000. Insured for $15,000.

—— Genin, the well-known hatter, who received the Independent nomination for the Mayoralty of New York City, declines.

—— For the quarter which ended on the 30th of September, the Baltimore Post-office yielded to the Government a balance of $21,029,60.

—— George Eskridge, Superintendent of the Virginian Institution for the Deaf and Dumb, and Blind, died on the 6th inst.

—— Fifteen million pounds is said to be the value of the potato crop in Ireland this season—the largest ever before known.

—— The hull of the wreck of the steamship Franklin, as she lies on the L. I. beach, has been sold at auction for the sum of $1,625.

—— During the first eight months of this year, up to August 31st, there arrived at New York about 119,000 German emigrants.

—— Accounts from Wheeling state that the Ohio river is rapidly rising, and an early resumption of navigation is confidently anticipated.

—— The Utica Observer says a bear weighing 300 lbs. was shot near Cold Brook, Herkimer Co., on Friday by Thomas Upright, of Newport.

—— The steamer Isabel, from New Orleans for St. Louis, struck a snag near the latter city, last week Thursday evening, and sunk to the boiler deck.

—— Hiram Powers, the great American sculptor, has given directions for the purchase of real estate in the new city of Leavenworth, Kansas Territory.

—— The Philadelphia Ledger estimates, on competent authority, that there will be 10,000 persons out of employment in that city, during the present winter.

—— There are between six and seven hundred Union Sunday Schools in Texas, most of them supplied with good libraries of the American Sunday School Union.

—— The Bangor Whig learns that Thomas Drew, Esq., recently deceased, has left by his will the sum of $20,000 for the establishment of a Farm School for boys.

—— The opinions of Judge Bronson and Daniel Lord are published, contending that the New York and New Haven Company, is liable for the Schuyler over issue.

—— Samuel Dunham, a soldier in the Revolutionary war, died at Mansfield, Ct., on the 12th inst., at the age of one hundred years and twenty days.

—— Screw steamer *Cleopatra*, from Quebec for Liverpool, put into St. Johns, (N. F.) on the 2d inst., short of coals. She has on board 389 men of the 71st regiment.

—— Among the passengers by the Africa, were the wife and daughter of the Rev. Jonas King, the well-known missionary of the American Board at Athens, Greece.

—— The Washington Monument has attained a height of one hundred and sixty-six feet, or about one-third of that which is contemplated. The work goes on very slowly.

—— The Boston theatres are not allowed to exhibit on Saturday evenings, that being, according to the old Puritanic style, the commencement of the Sabbath.

—— The great Second Advent Camp-meeting at Exeter, N. H., is now in progress. Crowds of people are in attendance, numbering many thousands, and from every section of the Union.

—— By the judicious management of the finances of the Buckeye State, Governor Medill has been enabled to pay off $1,500,000 of the State debt of Ohio, since the first of Jan. last.

—— The Petersburg (Va.) Express chronicles an extraordinary feat, accomplished a day or two since, by Mr. Henry Corlington, of Chesterfield. He killed *fifty-seven* wild ducks at *one* shot.

—— Rossini is now very unwell, in Florence. A writer from Italy says that the most profound melancholy has spread over his mind, and even if his life is preserved, he can never recover his wonted intellectual vigor.

THE RURAL FOR 1855.

NEW PROSPECTUS AND PREMIUMS.

THIS JOURNAL is so widely and favorably known that a lengthy Prospectus of the Sixth Volume, for 1855, is considered unnecessary.—The fact that the Circulation of the RURAL already exceeds that of any Agricultural or similar Journal published in either America or Europe, is the best evidence of its *Intrinsic Value* and *Superior Merit*. For AGRICULTURAL, LITERARY and FAMILY READING, NEWS, &c., combined, it is pronounced, by both its Patrons and the Press, the

BEST JOURNAL PUBLISHED!

And we are determined that the ensuing volume shall in all respects fully equal, and in some particulars *greatly excel*, either of its predecessors. Hence it will, as heretofore, embrace more Agricultural, Horticultural, Mechanical, Scientific, Educational, Moral, Literary and News Matter, interspersed with many ENGRAVINGS, than any other Journal in the Union,—rendering its Contents

UNEQUALLED IN VARIETY AND VALUE!

Having fully demonstrated the feasibility of properly discussing in *one*, the various important subjects usually occupying several journals, we shall continue to bestow sufficient expense, labor, time and talent upon the CONTENTS OF THE RURAL to not only *maintain* but *greatly augment* its Value and Usefulness as a Practical, Scientific, Literary and General Newspaper for THE FARM AND THE FIRESIDE. With an earnest desire to EXCEL, and abundant means and facilities at command, we are resolved that in the future, more than ever in the past, the RURAL shall maintain its rank and reputation as the

LEADING AMERICAN WEEKLY

AGRICULTURAL, LITERARY and FAMILY NEWSPAPER combined.

In all prominent features.—Practical and Useful, Moral and Entertaining,—the paper will pursue its former course,—aiming to exhibit, continually, in each department, unmistakable evidence of decided "Progress and Improvement." Believing it our duty to warn and admonish, as well as to instruct and entertain our readers, the RURAL will continue to call things by their right names,—avoiding the inculcation of error, exposing and condemning fraud and deception, and fearlessly and faithfully advocating the best interests of the RURAL POPULATION.

In brief,—confidently relying upon its zealous and influential friends for a corresponding increase of the extensive National Circulation it has already attained, we design to materially improve the forthcoming volume in

CONTENTS, STYLE AND APPEARANCE!

And shall freely use the essential requisites to accomplish, in the best manner, an object alike creditable to ourselves and beneficial to individual subscribers and community. By securing, as regular Contributors and Correspondents, some of the ablest writers in the country, the *Matter* of the RURAL will be superior,—while its *Manner*, or appearance, will be enhanced by the use of *Copper-faced Type* and an Improved Steam Press, which will enable us to print *better* and one-third *faster* than at present.

SAME SIZE AND PRICE!

Anticipating an increase of subscribers sufficient to sustain the paper at former rates, *its club prices will not be increased*. While some of our contemporaries are increasing the *price*, and others diminishing the *size*, of their sheets, we propose to do neither, notwithstanding the great advance in prices of paper, labor, and other expenses. On the contrary, we hope to furnish a BETTER PAPER, without change of either *size* or *price*,—and at the same time amply remunerate all disposed to aid in enabling us to furnish the BEST AND CHEAPEST Paper of its Class. For particulars all interested are referred to the annexed announcement.

OVER $700 IN CASH PREMIUMS!

Post-Masters, Agents, Subscribers,

And others who wish to benefit themselves, and promote the interests of community, are respectfully invited to note a brief announcement,—one which is, we confidently believe, most worthy their best attention. After bending low in grateful acknowledgment to Post-Masters, their Assistants, Agents and Subscribers, whose exercise of influence has enabled us to render MOORE'S RURAL NEW-YORKER the *first* Journal of its class in Circulation, Influence and Popularity, we desire to communicate, in a few words, the substance of a PRIZE LIST which *far exceeds*, in both *numbers* and *value*, any of its predecessors. Relying upon *acts* rather than *words*, we proceed without circumlocution or palaver, to invite your attention to the following list of splendid Cash

PREMIUMS FOR SUBSCRIBERS:

ONE HUNDRED DOLLARS for the largest list of Yearly Subscribers to the RURAL NEW-YORKER—the payment to be credited according to our Club terms, previous to the 1st day of February, 1855.

EIGHTY DOLLARS for the next (second) largest list, as above specified.

SEVENTY DOLLARS for the third list.

SIXTY DOLLARS for the fourth list.

FIFTY DOLLARS for the fifth list.

FORTY DOLLARS for the sixth list.

THIRTY DOLLARS for the seventh list.

TWENTY-FIVE DOLLARS for the eighth list.

TWENTY DOLLARS for the ninth list.

TEN DOLLARS to each of the *five* persons sending the 10th, 11th, 12th, 13th, and 14th lists, as above.

FIVE DOLLARS to each of the *five* persons sending the 15th, 16th, 17th, 18th, and 19th lists.

THREE DOLLARS to each of the six persons sending the 20th, 21st, 22d, 23d, 24th, and 25th lists.

☞ We also offer the following very liberal list of

CHRISTMAS CASH PREMIUMS.

FIFTY DOLLARS for the largest list of subscribers to the RURAL NEW-YORKER, sent in or mailed according to our terms, on or before the 20th day of December ensuing, (1854.)

THIRTY-FIVE DOLLARS for the next largest list, as above.

TWENTY-FIVE DOLLARS for the next list.

FIFTEEN DOLLARS for the next list.

TEN DOLLARS for the next list.

FIVE DOLLARS for the next list.

☞ Persons competing for Christmas Premiums are not excluded from the February prizes, so that one person may secure *One Hundred and Fifty Dollars, in Cash!*—another *One Hundred and Fifteen Dollars*, &c.

[In order to give Post Masters, Local Agents, &c., a fair and equal chance, traveling agents, post-riders and citizens of Rochester are excluded from competition for any of the above Premiums.]

SPECIFIC PREMIUMS.—In order to reach and reward *every one* who may lend a portion of influence to behalf of the RURAL NEW-YORKER, we propose offering hereafter to such as do not compete for either of the preceding prizes, a liberal premium for *each list* of from five to fifty subscribers sent in previous to the first of February next. The list will probably be issued in two or three weeks; but all who obtain subscribers in the mean time, will be entitled to premiums.

All competitors for premiums are expected to adhere strictly to the following

TERMS, IN ADVANCE:

TWO DOLLARS A YEAR. *Three Copies, one year, $5—Six Copies for $10—Ten copies for $15—Fifteen Copies for $20—Twenty Copies for $25, and any additional number at the same rate.* ☞ *As we are obliged to pre-pay American postage, our lowest Club price to Canadian subscribers is $1,50 per copy.* ☜ *To facilitate mailing, we prefer sending Club papers to one address at each post office, but the names of subscribers will be written on the papers if desired. Club papers sent to different post offices, and names can be sent in at different times. Bills of all specie paying Banks received at par on subscription.*

☞ Specimen numbers, show-bills, prospectuses, &c., sent free to all disposed to compete for the Premiums, or who desire to extend the circulation of the NEW-YORKER. Subscription money, properly enclosed, may be mailed at our risk, if addressed to D. D. T MOORE,

Oct., 1854. Rochester, N. Y.

Latest Counterfeits.

£1s, on the Bank of British North America, N. B.—The numbers on the notes are partly printed with a pen and partly lithographed, (according to the original) some of the letters in the words "New Brunswick" on the end of the note are badly executed.

5s, on the City Bank, New Haven, Conn.; vig. New Haven Common; an eagle on right end; a shield on left end; dangerous affair.

5s, on the Merchants' Bank, Poughkeepsie, N. Y.; vig. two females with shield; ships in the distance; a female on left end.

5s, on the Bank of Bath, N. Y., altered from smaller notes, are in circulation.

5s, on the Bank of North America, Conn., altered from 1s; vig. an angel blowing a trumpet.

10s, on the Citizens' Bank, Conn.; vig. Goddess of Liberty; an Indian on right end; a steamship between signatures; well done.

10s, on the American Bank, Providence, R. I.; vig. a female in a sitting posture; a female on lower left corner, with agricultural implements; a man's head on right end.

10s, on the Southport Bank, Conn., altered from 2s; vig. three men standing; Indian woman on the right end; ship on left end.

LIST OF BANKS WHICH HAVE RECENTLY FAILED.

Farmers' and Merchants' Bank of Memphis Tenn., failed Aug. 16.

Bank of Washtenaw, Ann Arbor, Michigan, failed Aug. 21.

Bank of Milford, at Milford, Delaware, failed Aug. 24.

Monsam River Bank, Sanford, Maine, thrown out by the Suffolk (Mass.) Bank, September 27.

Erie and Kalamazoo Railroad Bank, Adrian, Michigan, failed Oct. 6.

Adrian Insurance Company, Adrian, Mich., failed Oct. 6.

Ellsworth Bank, Ellsworth, Maine, thrown out by the Salfolk (Mass.) Bank, Oct. 6.

Eighth Avenue Bank, New York city, failed Oct. 6.

Knickerbocker Bank, New York city, failed Oct. 12.

Suffolk Bank, New York city, suspended Oct. 12.

Newport Safety Fund Bank, Newport, Ky., failed Oct. 16.

Kentucky Trust Company, Covington, Ky., failed Oct. 18.

Bank of the Union, New York city, closing.

Rumors of the failure of other Western Banks are afloat—among them the Bank of Connerville, Ind.; the Elkhart County Bank, Ind., and the Savings Bank, Ohio. We have no satisfactory information of the truth of the reports; and can only advise caution in the receipt of money. —*Thomp. Rep.*

THE DANGERS OF FAST STEAMING ON THE ATLANTIC.—Captain West, of the Atlantic, has said that twelve days is as short a time as any of the ships now build can safely make the passage in ordinary weather; and that, except in uncommon cases, every hour less than that is gained by a serious risk. It must surely now appear to be a duty to abandon this wicked recklessness, and to regard safety as more necessary than that extraordinary speed, which covets a victory over a rival ship by five minutes between New York and Liverpool.—*Boston Transcript.*

IOWANS ON A TOUR EASTWARD.—Quite an excitement was caused by the appearance in our city of two wagons from Iowa. One contained a buffalo and two deer, and the other two elks. We understand by the owner that the deer were one year, and the buffalo and elk two years of age, and they were captured in the northwest part of Iowa, and had been two months on the road. The buffalo was valued at $1,000, and the elks at $1,500. They are for sale, bound for the East, and a market.—*Cleveland Herald.*

COUNTERFEIT QUARTERS.—Counterfeit quarter dollars, made of zinc, incrusted with silver by the galvanic process, and cut and stamped in admirable imitation of the coinage of the mint, are in circulation. It is a trifle too light, but is best detected by its brittleness, in consequence of which it is easily broken under the stroke of a hammer.

☞ The wreck lately seen at sea and supposed to be that of the lost City of Glasgow steamer, was that of the iron ship Shandon, which was burnt on the passage from Glasgow for Montreal.

HORRIBLE RUMOR OF PIRACY.—The *Buffalo Republic* has the following rumor of piracy on the lakes:

A rumor has been current for several days on our docks that the schooner Robert Willis, whose sudden disappearance on Lake Michigan last fall was noticed at the time, and from which no intelligence was ever afterwards received, had been captured by the Mormons of Beaver Island, her captain and crew massacred, and the vessel unloaded and scuttled. At the time of her loss the Willis was bound from Chicago to this port, with a cargo of wheat, and was last seen by the schooner Lansing, on the 22d November, off Sheboygan, bound up the lake, in a very heavy north-east gale. The news of her capture, &c., is said to have been received thro' a Mormon who escaped from the community at Beaver Island, and who has made oath to the facts above stated. It is also said that the United States steamer Michigan has been sent to the Island to look into the affair.

Marriages.

In Orleans, Jeff. Co., Oct. 12, 1854, by the Rev. D. W. Raney, of Clarton, N. Y., Mr. SYLVESTER GREENE and Miss HARRIET H. MITCHEL, both of the former place.

On the 17th inst., at Carmel, N. Y., the Rev. Silas ANTOINETTE L. BROWN to Dr. JAMES H. MERRITT.

In Parma, Oct. 17th, by the Rev. Jonas Woodward, Mr. HENRY S. POMEROY, of York, Livingston Co., and Miss ANNA E. HIBBERD, of Parma.

Commercial.

BUSINESS AND FINANCE.

There have been no arrivals from California during the week, although two Steamers are now fully due, and looked for hourly at New York. The specie exported during the week footed up at $1,059,000; making since January 1st, an aggregate of $23,421,000.

The New York money market is reported stringent; and the *Times* says the city balances and credits of the country Banks having become exhausted, their circulation is sent home for redemption. This compels them to offer for sale, or hypothecation, a large amount of State stocks, for the purpose of raising money to meet the call for the redemption of their bills.

The amount of exports, other than specie, for the week, is $1,118,000, and of imports for the same time $2,776,747; total imports for the year, $165,083,000.

Several distinguished legal gentlemen, including Judge BRONSON, CHAS. O'CONOR, and DANIEL LORD, have published opinions that the New York and New Haven Railroad Company are legally holden for the $2,000,000 spurious stock issued by ROBERT SCHUYLER. If this opinion be sustained by the Courts, it reduces the actual value of the stock two-fifths, and is a sufficient punishment on the Company for not looking more closely to the conduct of its agents.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, Oct. 25, 1854.

THERE is a feverish excitement in the grain market, and breadstuffs have been rising for several weeks past. Wheat sells this morning at $2,00½, and Flour at $9,25@9,50.—Barley has been going up also, and brings to-day $1,03.—Oats are two cents per bushel better, and Corn unchanged. The Buckwheat trade of the season opens at 75 cents.

Pork by the hog, and Mutton by the carcass, begin to be sold in our streets, the former bringing $5 to 5,50 per hundred, and the latter $3,00 to $4,50.

There is no change in other products worthy of special notice.

Rochester Wholesale Prices.

NEW YORK MARKET—Oct. 23.

FLOUR—Demand continues good. Nearly all descriptions firmer. Stock of better grades small, and receipts limited. Sales at $7,87½@8 inferior State; $8,25@8,62½ common to straight and choice State; $8,62½@8,75 common to good West; $9@9,25 extra Michigan; $9,25@10,62½ extra Genesee.

GRAIN—Transactions in Wheat are extremely limited, and market without scarcely a parcel left in first hands.—It is useless to attempt to give quotations—in fact, good sound parcels would bring almost any price asked in reason. Sales Red Upper Lake at $1,85 afloat; Red State Island at $2. Rye scarce and in good demand. Prices have still further advanced. Sales good North River at $1,20. Barley quite scarce and prices tend upward; sales prime four-rowed at $1,38. Transactions in Corn are to a fair extent, and market without important change. Western mixed a shade lower. Sales at 70@80c corn. to prime Western mixed. Oats scarce and in request; sales at 50@60½c State and Western.

PROVISIONS—Pork rules with a good demand for home trade and some inquiry for export. Market closing at $12,37½ for mess; $11,31½@12½ for prime. Lard more active, but at lower prices; sales at 9½@10½c for fair to prime. Butter in fair request at 13@18c for Ohio, 18@22c State. Cheese quiet.

ALBANY MARKET—Oct. 23.

FLOUR—We notice a great degree of firmness in the medium descriptions of Flour, with an advance of 12½c. per barrel on extra Genesee. The demand is not active, and the sales making are mainly for the supply of the river and home trade. There is nothing at present doing for the east. Sales at $8@8,50 for com. to good State and Western; $8,50@9,50 for good to fancy do., and $9,50@10,37 for fancy to extra Ohio and Genesee. The latter figure is only obtained for a very choice brand of State. Corn Meal is in good request and firm, with a fair business doing at $1,50@1,62 per 100 lbs. Buckwheat Flour is selling at $2,50 per 100 lbs. in the street.

GRAIN—Nothing has transpired in Wheat. Genesee is held at $2,31 without sales. Corn is without important change, but rather quiet, with a tair supply offering. Sales Western mixed here and to arrive at 78@78½. Barley opened very quiet and closed very irregular. Sales good two-rowed on the spot at $1,32, and 10,000 bus. four rowed deliverable in all next month at $1,37½, two-rowed at $1,34@1,37½; part two-rowed and four-rowed at $1,33, and four-rowed at $1,31. Most holders are quite firm and refuse to sell at anything below our highest quotation.—Oats are more plenty, and the market rather easier; sales of State and Ohio at 62@62½c, measure.

HOPS—Our market is quiet. There has been no variation in prices during the past week, notwithstanding large shipments have been made to Europe. The chances are in favor of the grower.

BUFFALO MARKET—Oct. 23.

FLOUR—The demand to-day is good, and the market steady. Buyers more willing to accept holder's terms, and the transactions include two or three parcels of low grades. Receipts since Saturday noon large. Sales at $7,75@8,50 com. Illinois; choice do. at $7,87½; do. Ohio at $7,87½@8; and favorite Illinois and pure Mich. at $8,12½@8,25.

GRAIN—Wheat in active request as usual for milling, with a light supply offering. Cargoes taken as they arrive. Sales 12,000 bushels Milwaukee afloat on private terms.—Corn firmer and in moderate demand, buyers purchasing sparingly at the improvement, and only to freight boats. The receipts since Saturday noon are 63,000 bus.; sales about 10,000 bus. at 67c. Oats firm and active; sales at 41@41½c. Rye—small sales at $1.

NEW YORK CATTLE MARKET—Oct 16.

AT Washington Drove Yard—Offered to-day 3,111 Beef Cattle; during the week 2,900. Prices—Beeves range from 7½ to 10½c per lb. Cows and Calves, $30 to $45.—Veal Calves, $2 to 7. Swine, corn fed, $4,00@4 75. Sheep and Lambs active and higher.

At Browning's—At market, 261 Beef Cattle, 42 Cows and Calves, 93 Veals, 5,211 Sheep and Lambs. Prices—$6@8,75 per 100 lbs for Beeves; Cows and Calves range at from $30 to $60. Veals sold at from 1½@4½c per lb. Sheep range at from $2,50 to $6. Lambs $2,50 to $4,00.

At Chamberlain's—At market 468 Beeves, 175 Cows and Calves, 7,042 Sheep and Lambs.

Prices of Beef ranged at from $7,00 to $10,00 per 100 lbs. Cows and Calves at from $30 to $60. Sheep $2,00 to $6. Lambs $2,00@4,00.

At O'Brien's—Sales of Beeves at $6@9 per 100 lbs.—Cows and Calves at from $25 to $46. Veal 6@6½c.

ALBANY CATTLE MARKET.—Oct 23

AT W. Woollord's Bull's Head, Washington street.—Beef Cattle—880 at market. Prices—Extra $7,00; 1st quality $7,00; 2d do, $6@6,00; 3d, $5,50.

Cows and Calves—14 in market. Prices range from $25, $30@40.

Sheep and Lambs—1,254 in market. Prices, Sheep from $2,50 to $4; Lambs from $2,00@3,00.

Swine—400 in market. Prices, $4,50@4,25.

CHICAGO CATTLE MARKET.—Oct. 18.

AT West Belgium—Beef Cattle—Nine head from Lake county at $4,75. 44 from Du Page co. at $3,00. 14 from Kane co. at $3,10. 18 from Aurora at $3 50 from McHenry co. at $4,50. 19 from Kane co. at $3,00 from Warren co. at $2,00@2 87. 18 from McHenry at $3,10. 22 from Du Page co. at $2,87. 80 from Kane co. at $2 85. 12 from Lisle co. at $3. 81 from Kane co. at $2,85. 154 from Will co. at $2,87. 40 from McLean co. at $3. Sheep—110 from Kane co. at $2,06. Hogs—715 from Kane co. at $3. 61 from same at $3,50. 552 from Warren co. $3. 19 from Kane co. at $3,00.

CATALOGUE OF RARE AND VALUABLE SEEDS,

Raised and put up by I. W. BRIGGS, Macedon, Wayne County, New York. Per paper.

ORANGE WATERMELON, (New and Fine.)—A great curiosity, and not to be excelled by any of the Melon family..... 25c

ICE CREAM, or White *Sugar Melon* of Alabama.—New variety, very large, globular, white, thick rind; white flesh, quality unsurpassed; white seeds, and altogether worthy of its name. The rind separates from the pulp, like the Orange Melon, but not so perfectly. It is a good substitute for, and by many preferred to the Citron for preserving..... 25c

CITRON NUTMEG MUSKMELON.—This new variety is a little superior to those fine, small Nutmeg Melons so well known, but its main excellence is its size and productiveness—specimens of 7 and 8 lbs. weight being quite common..... 12½

[The above Melons were exhibited at several of the adjacent County Fairs, to the admiration and gratification of thousands of tasters, many of whom eagerly secured a few seeds at 25 cents per dozen.]

THE CELEBRATED JAPAN PEA.—This new article proves to be adapted to our soil and climate, having matured well for two years. It produces an average of 300 pods to each plant. Two quarts of seed is sufficient for an acre,—cultivate same as Corn. It is believed it may be made a profitable crop—time and experiment will test their value..... 12½

NEGLEY'S SEEDING CUCUMBER.—A few samples to spare, the product of only one seed. Truly beautiful..... 25c

WATERMELONS.—Mountain Sprout, Mountain Sweet, Mexican, Sandwich Island, (2 varieties,) South Carolina, Spanish, each..... 06

MUSKMELON.—California..... 05

SQUASHES.—*Winter*: Sweet Potato, Vegetable Marrow, Polk, (small, very good.) *Summer*: Apple and Crook-neck, (both small and good,) each..... 06

TOMATOES.—Grape, (small for pickling.) Mammoth Red, each..... 06

VEGETABLE EGG, (white, ornamental and valuable,).05

DOUBLE SUNFLOWER, (the "Floral King,")..... 06

VICTORIA RHUBARB, (the best pie plant)..... 05

FLAT DUTCH CABBAGE, (the best winter,)..... 06

SPANISH TOBACCO..... 06

CORN—Rice or Pop, (2 varieties,) Adam's Early, Sweet, (large improved,) each..... 06

The above seeds will be forwarded to any address in the United States, *free of postage*. Orders containing the price and names of seeds desired, will receive prompt attention, from

SENECA LAKE HIGHLAND NURSERIES,

offers great inducements to persons in the Eastern, Western and Southern States, who are wanting Fruit and Ornamental Trees, or any Nursery articles, at wholesale or retail, and will furnish, *free of charge*, a descriptive and price Catalogue, and also the HORTICULTURAL ADVERTISER, containing much horticultural information, published at these Nurseries, to all applicants by mail 251-11

SUBURBAN RESIDENCE AND FARM FOR SALE.

THE GROVE FARM, adjoining the corporation line of Canandaigua, on the high ground north-east of the village, and within a mile of Market, R. R. Depots, Post Office, Schools, Churches, &c., is one of the most beautiful and desirable suburban residences in Western New York. It contains 103 acres of choice land, including about 25 acres of woodland,—a fine, well finished brick house, in the English Cottage style, a tenant house, three barns, sheds, granary, and other out-buildings, all of them erected at a cost of not less than $10,000. There is an Apple and Peach orchard, and a Kitchen garden well stocked with all kinds of small fruit, and a never-failing Spring capable of watering the whole Farm, which is nearly of a square form, having the public road on three sides of it, and the wood land on the fourth side. There is also about three of acres of second-growth timber, in front of the house, giving name to the Farm, and from which there is a fine view of the Lake and surrounding country.

The buildings and 20 acres may be purchased for $10,000, or the whole Farm for $100 per acre, with no more required down, or collaterally wanted, than may be necessary to render the sale positive. The location is a most healthy and eligible one for either a farmer, or a business man who wishes to live and yet possess access to the conveniences of town life and the best society.

For further particulars, apply to the subscriber on the premises, or address H. M. R. MACAO,
250-3t Canandaigua, N. Y.

A RURAL RESIDENCE FOR SALE.

FOUR miles north of Geneva, N. Y., containing 30½ acres of land, good buildings, 1½ acres of the best varieties of fruit, good water, &c. This is a good location for a Gardener or Physician, and will be sold or exchanged for an Improved Farm in Michigan, Illinois, or Wisconsin. Price, $1,600—$1,000 or $1,200 down; the balance may be arranged to suit the purchaser. For further particulars address the subscriber at Oaks Corners, Ontario Co., N. Y., (post-paid)

Phelps, Oct. 19, 1854. [250-3t*] DANIEL HIGBIE.

FARM FOR SALE.

SITUATED in the town of Portage, Liv. Co., N. Y., two miles south of Hunts Hollow, five miles from Nunda, and five miles from Portage Bridge, one mile from the N. Y. City & Buffalo R. R. Said farm contains 139 acres, 22 acres in woods,—principally Oak, Chestnut, and Pine,—is well watered, and well fenced with Oak and Chestnut rails; 32 acres of wheat on the ground. There are two comfortable houses, two barns, two carriage houses, three orchards of good grafted fruit, Peaches, Plums, Cherries, &c. It is well adapted to grain or grass. Price $45 per acre. For further particulars inquire of B. BEARDSLEY,
Hunts Hollow, Livingston Co., N. Y. 250 3t

PARTNER WANTED.

AN enterprising business man, who can furnish $3,000 cash capital, to join in an established Nursery in Syracuse, for the purpose of enlarging and conducting the business in all of its branches. One preferred who has a fine taste for the beautiful in nature. To any young man who wishes to embark in the surest and healthiest of employments, this is a rare opportunity.

Address Box No. 1216, Syracuse, with real name, will meet with prompt attention 250-3t

1,000 YOUNG MEN,

CAN readily make over 100 per cent., with a small capital, in a new, respectable and easy business, to which universal demand. This is no patent medicine, nor book business.—For full particulars address, post-paid,

250-3t COOK & CO., Detroit, Mich.

Fairfield Classical Academy and Female Collegiate Institute.

REV. L. D. STEBBINS, A. M., PRINCIPAL.

THIS Institution is located at Fairfield, Herkimer Co., N. Y., upon a beautiful range of hills, in one of the healthiest villages in the State, and is reached by a line of stages from the Central Railroad at Little Falls and Herkimer, by 10 miles travel. It has by over *fifty* years of faithful instruction and good discipline, attained a large reputation. Its Laboratory and Apparatus are hardly equalled by any Academy in the State.

It has 6 large, commodious buildings all in a pleasant grove. Its Faculty is large and competent. The Pianist is a gentleman of superior qualifications. The next term will begin November 8th. Board, room furnished, fuel, washing, incidental expenses, tuition in common English, only $19 per quarter. Conveyance free from Rochester, Auburn, Syracuse, Watertown—fare being remitted on payment of Tuition. There is a complete graduating course for Ladies, and full courses for gentlemen for business and College; and teaching. For the Ladies there is a large Gymnasium for daily exercise.

For conveyance and rooms, address the Principal at Fairfield, Herkimer Co., N. Y. J. SMITH, Pres't.
J. MATHER, Sec'y. 245-4teow

AN EXCELLENT FARM FOR SALE,

THREE miles from Weedsport and five miles from Auburn. It contains 125 acres of as *choice land* as there is in the County of Cayuga. It has good fruit, fences, buildings, &c. Is near a school, and in a good neighborhood. Any one desiring a choice farm, eligibly located as to markets, &c., will find it here.

Price, $60 per acre. Terms of payment easy. Enquire on the premises, or of the undersigned at 107 Genesee St., Auburn, N. Y. [249-3t] ELIAS SOUDER.

ASIATIC FOWLS.

PHEASANT COLORED CHITTAGONGS, Brahmas, Cochins and Shanghais—genuine, as to blood—of the breeds of May and June, for sale at one dollar the pair. The Chittagongs are solid, compact birds, although, when full-grown, of the largest size; and are not surpassed as layers. The cocks wear high colors. The pullets a brownish buff, tipped with black—often of great beauty of plumage. Put twelve, in one case, delivered at the Express office, the price will be five dollars. DAVID ELY,
Oct. 2, 1854.—248tf 69 Pittsburgh St., Rochester, N. Y.

Rochester, N. Y., Aug., 1854. 246-tf

EYE AND EAR INFIRMARY.

DR. WALKER, Oculist and Aurist, (from London, England,) may be consulted daily, and testimonials obtained at the office, 52 State St., Rochester, N. Y. 243-tf

Poetical.

A NAME IN THE SAND.

BY MISS H. F. GOULD.

Alone I walked the ocean strand;
A pearly shell was in my hand;
I stooped and wrote upon the sand
My name, the year and day.
As onward from the spot I passed,
One lingering look behind I cast:
A wave came rolling high and fast,
And washed my lines away.

And so methought 'twill shortly be
With every mark on earth from me!
A wave of dark oblivion's sea
Will sweep across the place
Where I have trod the sandy shore
Of time, and be to been no more;
Of me, my name, the name I bore,
To leave no track or trace.

And yet with him who counts the sands,
And holds the waters in his hands,
I know a lasting record stands,
Inscribed against my name.
Of all this mortal part has wrought,
Of all this thinking soul has thought,
And from these fleeting moments caught
For glory or for shame.

AUTUMN.

Autumn, in all its due successions, to my sight
Presents but varied beauties, tropical all,
All in their season. These fading hazes,
That with their rich variety of hues
Make yonder forest to the slanting sun
So beautiful, to you awake the thought
Of winter, cold drear winter, when these trees
Each like a fleshless skeleton shall stretch
Its bare brown boughs; when not a flower shall spread
Its enticts to the day, and not a bird
Carol its joyance,—but all nature wear
One sullen aspect, bleak and desolate,
To eye, ear, feeling, comfortless alike.

Rural Sketch Book.

[Written for the Rural New-Yorker.]

THE CATHEDRAL OF COLOGNE.

A MONKISH LEGEND.

LEAVES FROM A TRAVELER'S NOTE-BOOK.—NO. III.

—"The spirit I have seen
May be the devil; and the devil has power.—HAMLET.

Many, many years ago, Conrad De Hochstedten, the Archbishop of Cologne, entertained the desire of building a cathedral that should eclipse in grandeur and magnificence all the religious fanes that then existed. No sooner was the thought conceived in the Archbishop's mind, than he summoned to his presence the most celebrated contemporary architect, and ordered him to draw the necessary plans for its immediate erection. He enjoined upon the architect that all the details, even the most minute, should bear the impress of originality, and that in point of size and beauty, it must yield to none of the boasted piles of France or Germany. The architect, elated at this opportunity of distinguishing himself, returned to his abode, and proceeded immediately to the joyful task. Vain, however, were all his endeavors; none of the designs he made would satisfy him.

Taking his hat and stick he sallied forth and bent his steps to the borders of the Rhine thinking that the cool evening breeze would animate his mind and quicken his thoughts. The sun was just sinking behind the horizon, and its last expiring rays were playing in red and fitful gleams upon the bosom of the stream which "flushed with quivering radiance here and there."

"Ah!" said the artist, as he regarded the declining god of day, "a cathedral whose elevated towers would glisten in the light of the sun, when the river and the city were already dark with the gathering shades of night, would indeed be grand;" and he commenced drawing figures with his cane upon the beach. Towers, altars, windows, buttresses and magnificent portals were rapidly sketched and then obliterated with his foot, as lacking grandeur and originality.

Not far from him was seated a man decrepit with age, and short in stature, who regarded him and his labors with earnest attention.—Once he thought he had drawn something novel, and cried out in ecstacy, "That is it! that is what I seek! No one can deny its merit and originality;" when the little old man addressed him with a mocking laugh.

"You think you are inspired, but it is only your memory that serves you unawares; '*that is it*' indeed! Why, it is but a part of the cathedral of Strasburg; try again."

The architect effaced the design, for he saw the truth of the old man's remarks, and perseveringly essayed new sketches. As often, however, as he drew anything—a tower, a turret, or an arch—that pleased him, the old man murmured laughingly—"Mayence"—"Amiens"—"St. Denis"—or the name of some other city famed for its cathedral, clearly demonstrating to the excited architect that the ideas he considered as inspirations were but souvenirs.

Maddened by his fruitless attempts, and the supercilious sneers of the old man who sat calmly regarding him, he exclaimed in frenzied tones,

"You possess an astonishing memory, and have a profound knowledge of our art; take this stick, then, graybeard that thou art, and aid me!"

The old man kept silence, only suffering a derisive smile to play upon his withered countenance. This enraged the artist the more, but dissembling his ire, he again addressed him:

"Try; see what you can do; draw me the outlines of an edifice that differs from and far surpasses any yet erected, if it is possible to do so;" and he again offered him the cane.

"I can aid you if I choose," he replied, "but in that event you would have all the honor, and I obtain no recompense."

"You shall be well rewarded," he answered, "take this purse of gold as an earnest of what I will give you hereafter."

"Gold! offer gold to me!" and producing from beneath the cloak in which he was enveloped a plethoric looking purse, he threw it in the air, and as he caught it in its descent, the sound that it gave out evinced its contents to be gold.

The architect then drew from his doublet a long and glittering dagger, and with uplifted arm advanced toward the old man, who, with a suppleness that ill accorded with his years, raised himself from the rock upon which he had all along been seated; grasping the hand of the architect he disarmed him of his weapon and threw him heavily to the ground.

The discomfitted architect found himself powerless and perfectly unable to move. The old man took from his hand the cane that he still held and drew rapid lines with it through the air; streaks of fire crossing and interlacing each other appeared at every motion, until at last a beautiful edifice became visible, hanging in the air.

"There," said the old man, "there is the design of a cathedral that equals all you can desire; be here tomorrow night at twelve, and you shall have it fully elaborated upon paper, provided you will sign a bond *giving your soul for all eternity*;" he ceased speaking and vanished in a cloud of flame, leaving behind him an unmistakeable sulphurous odor. The architect swooned, and when he recovered his senses found that it was far into the night.—Raising himself up he turned his steps homeward, and on reaching his house retired to bed but not to sleep; visions of the flaming cathedral he had seen were constantly present to his sight.

As soon as the first faint light of the dawning morn entered his chamber, he arose from his couch and seizing his paper and his crayons, attempted to recall the magnificent proportions of the fiery structure that haunted his imagination. His endeavors were abortive, for his memory proved treacherous, and when a vague idea of any of its parts flitted across his mind, he found that it had fled from his remembrance before he could jot it down. He finally gave up in despair, and hastened to the residence of his employer, Conrad De Hochstedten, to whom he recounted his adventures of the preceding night.

The Archbishop told him that the plan must be obtained, but that he could not allow him to barter his soul to the evil one in order to procure it. Conrad reflected for a while, and going to his cabinet took therefrom a small and beautifully carved casket.

"Take this," he said, "it is made of pieces of the true cross; go to the rendezvous at the appointed time, get possession of the plan and place this sacred relic on it: the demon will become powerless under its magic influence."

The architect repaired early to the spot; punctual to the hour his Satanic majesty—no longer disguised—appeared.

"Here is the plan, and here the bond; sign it," he said.

"Hold!" cried the architect "it is but right that I should see the plan before I sign that fearful parchment, and satisfy myself that everything is correct."

"Certainly," replied the demon, "no request could be more just."

The architect took the plan, examined it, and then hastily placed it beneath his mantle, covering it with the precious casket at the same time exclaiming; "by this sacred relic I command thee, Satan, to retire. Avaunt! I say, Avaunt!"

The demon uttered a shrill cry of rage, and then spoke as follows:

"I am vanquished; 'tis a priest has counselled you to this; 'tis a ruse of the church; but I will have revenge. This cathedral, the plan of which you have so surreptitiously obtained, shall never be finished, and as for thee, vile fool, of a viler counsellor, thy name shall perish from the memory of man; you shall be forgotten and unknown." Having thus spoken he disappeared.

Soon the erection of the cathedral commenced, and the architect, seeing its rapid progress, thought that the prediction would not be verified, and as for his name, he would have it deeply engraved upon a bronze tablet and inserted in a conspicuous place within the tower. One day, however, when the tower had reached a considerable altitude, the architect ascended to its summit to give directions concerning the insertion of the plate that was destined to perpetuate his name forever—a loud noise was heard, a noise like a clap of thunder; the tower was enveloped for a moment in a misty cloud, although the heavens all around elsewhere were beautifully clear. The cloud passed away, but the architect had disappeared: he had fallen from the tower to the pavement below, where he was found lifeless with his body horribly crushed and mangled by the fall.

Dissensions soon arose between Conrad and the people; the labor upon the cathedral was interrupted, and the bronze plate was never placed within the tower. Thus was the prophecy of the fiend fulfilled; the cathedral is still unfinished, and the name of the architect "forgotten and unknown."

Such is the legend that passes current among the ignorant and superstitious in Cologne; as to its probability, the reader must decide; but there is a mysterious power, however, that exerts a Titanic influence against its completion that neither relics nor priestly prayers can overcome—that power is Gold, unlimited Gold, for millions upon millions are necessary to complete the edifice upon the original design.

Rahway, Oct., 1854. J. S. H.

REFINING OF GOLD AND SILVER.

As our readers may be curious to know what is done with the gold and silver before it is sent on to Philadelphia, we annex a brief description of the process it undergoes in the Assay Office.

The gold, when it is brought to be assayed, is in an impure state. It is sometimes an alloy—that is to say, in combination with another metal; when mixed with mercury, it is called an amalgam. The first process it undergoes is of melting down into bars, when it is examined by the assayer and its value determined.

It is then reunited with a mass of silver sufficiently large to combine with it intimately, and while heated is poured into water, when it forms into minute shining particles, and is called granulated, from the shape it assumes. The next step is to submit it to the action of nitric acid, being mixed with heated steam to render it more active. This acid will not affect gold in the least, but on silver it acts very readily, eating it away, as the workmen say, and forming the nitrate of silver. The term *eating*, by the way, when applied to action of acids on metals is wholly mis-placed. Acids have no such Epicurean appetites as the phrase would imply. The metal is not destroyed by the corroding action—every atom of it is there, although in a different form, and exhibiting different properties. Thus, in the present case, the silver forms a combination with the nitric acid and becomes a solution of the nitrate of silver, while the gold is precipitated, freed from its union with the silver.

The solution (the nitrate of silver) is then drawn off, and the residue, though it looks like iron rust, proves to be gold in a pure state.—To bring the silver back to its original form, muriatic, or, as chemists now term it, hydrochloric acid, is added to the nitrate of silver, when an interchange of acids takes place, and the muriate of silver is precipitated, the nitrate of soda being held in solution.

To this muriate of silver is added granulated zinc, which, by reason of the great affinity which muriatic acid has for it, forms the chloride of zinc in solution, the silver, being precipitated in nearly a pure state.

The next step in the process is to dry the gold and silver, so it can be melted into bars. This is done by what is termed sand-baths—that is, sand with the temperature raised so as to drive off the moisture. After being taken from the bath, the silver and gold are subjected to the action of a hydraulic press, and come out in the shape of large cheeses, and, indeed, are called by that name.—*N. Y. Eve. Post.*

PARTY PREJUDICE.

A good anecdote is told of a countryman from New York who was visiting Washington at the time Mr. Van Buren was Vice President. Our friend was a red hot Democrat, and of course held Mr. Van Buren in the highest reverence. He sat in the circular gallery of the Senate, gazing at the Vice President with a mingled feeling of awe and state pride, when suddenly a tall and majestic form appeared at the side of the hall and beckoned to Mr. Van Buren. There was little business doing, and the Vice President, calling a Senator to the chair, joined the person mentioned, when both seated themselves on a sofa, both snuffed from the same box—the hand of the Vice President was laid playfully upon the knee of his companion, and every now and then a hearty laugh would escape them, showing that whatever might be the topic they were discussing, it was one which was agreeable to both of them.

"Is that Mr. Calhoun with the Vice President?" asked our country friend, turning to a person near him.

"No, sir."

"Is it Mr. Benton?"

"No, sir."

"Is is Gen. Wall?"

"May I ask who it is?"

"Why, that is Mr. Clay."

"Mr. Clay!" almost shrieked the man; and does Mr. Van Buren *speak to him?* Rot me if ever I vote for him again!" and the fellow stalked from the hall, firmly believing the country was lost.

A man of sense will never swear. The least pardonable of all vices to which the folly or cupidity of man is addicted is profanity.

Indolence and indecision of mind, though not in themselves vices, frequently prepare the way to much exquisite misery.

Wit and Humor.

ANN ADDRESS TO THE ZAR.

QUESTIONIN' OF HIM.

Halt to thee, Zar of Rushee! How do you feel,
Now that the Alleys have both got on top of you
A-pummelin' your bread-basket most'n you like,
I 'spect? Ain't you goin' to cry "quit,"
As Mellish did to Mellish before they fit?
Are you'n' Britain in collision together
About the Moll Barry and the Wallack Provinces
Isn't it all gamme on both of your parts?
Say, you old naughtycrat of all the Rushes,
Do you 'xpect to hold out long agin' the Alleys,
Victoria and Louy Napoleon? Ain't you afeard
That *Wretched* Pushow alone 'll give you fits?
Spose ole Schammel from the Kaukasus
Comes down, what then? Ha! ha! *He'd* make you cry
Copeens in less than a minit, by my watch!

(*Knickerbocker Magazine.*

Good Stories.—Hon. W. Chandler, told us the following capital stories, illustrative of recent political movements. One was of an old man in Bangor, who would steal, but at the same time was a man of his word. He was one day engaged to help unload a cargo of fish, on condition that he should have nine of them, *if he would not steal any.* But night coming on, and opportunities for stealing becoming good, he took the nine fish and returned them to to the employer, saying that he believed *he could do better.* The South have kept the nine fish, and then go on to steal the rest of the cargo. The fraudulent name of popular sovereignty given to the Nebraska system, he illustrated by the story of a man who cried, "Hot Mince Pies." Some person bought one, and found it frozen hard as an icicle. "You infernal scoundrel," said he, "why did you call this hot mince pie?" "Because, *that is the name of it!*" was the reply.

A Model Clerk.—Young man.—I called to see about the clerkship you advertised as vacant.

Old Gent.—Have you a gold watch and chain, a fast horse, a diamond ring, six suits of clothes, a bull dog, a thousand cigars, a cask of brandy and an assortment of canes?

Young man.—Yes, sir, got 'em all.

Old Gent.—Then you'll suit. My other clerk furnished himself with all these out of the till, and as you're supplied I'll save the expense.

M. de Balzac was lying awake in bed when he saw a man enter his room cautiously, and attempt to pick the lock of his writing-desk.—The rogue was not a little disconcerted at hearing a loud laugh from the occupant of the the apartment, whom he supposed asleep.—"Why do you laugh?" asked the thief. "I am laughing, my good fellow," said M. de Balzac, "to think what pains you are taking, and what a risk you run, in the hope of finding money by night in a desk where the lawful owner can never find any by day." The thief "evacuated Flanders" at once.

An Irish bricklayer was one day brought to the Edinburgh Infirmary, severely injured by a fall from a house-top. The medical man in attendance asked the sufferer at what time the accident occurred. "Two o'clock, yer honor," was the reply. On being asked how he came to fix the hour so accurately, he answered—"Because I saw the people at dinner, through a window, as I was coming down!"

Your father would not have punished you, my child, if you had not used profane language and sworn. Well, father swears. I know he has been in the habit of it, but he leaves off now. Its a pity he hadn't done it before he taught Bill and me to sware, and then we should have been saved many a licking!

A lawyer in Worcester recently undertook to get a man clear of theft by showing the jury a crack on his skull, which he asserted was made by being crossed in love when young!—The jury were not quite ready to "walk the crack," and the defence did no good, except to show a pretty strong suspicion of a crack in the head of the lawyer.

"Oh!" exclaimed a poor sufferer to a dentist, "that is the second wrong tooth you have pulled out?"

"Very sorry, sir," said the blundering operator, "but as there were only three when I began, I'm sure to be right next time."

An editor out west offers his entire establishment, subscribers, accounts, &c., for a clean shirt and a good meal of victuals. He has been trying the experiment of endeavoring to please everybody.

Among the improvements to be adopted in the costume of the British soldier, helmets are to have a spike on the top of them. Punch thinks this is "putting too fine a point on it."

The New York Dutchman says that it is so dry up in Iowa that the steamboat people have to sprinkle the rivers to keep the dust from choking the water-wheels.

Definition, a la Talleyrand.—Ingratitude is only a painful feeling of consciousness that there are no more favors to be received from the same person.

A gentleman met a young girl, whose parents lived near his house. "What are you doing, Jenny?" said he. "Looking for a son-in-law for my mother, sir," was the smart reply.

It is said, but with what truth we do not pretend to say, that all the ladies who sweep the streets with long dresses have big feet and thick ancles.

Youth's Corner.

ILLUSTRATED REBUS, NO. 44.

☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 34 letters.
My 22, 14, 18, 5, 28, 2, 27 is moral rectitude.
My 35, 3, 1, 21, 33, 9, 33, 11, 15, 27 is brotherhood.
My 19, 37, 14, 18, 14, 29, 27 is frugality.
My 6, 23, 36, 31, 10, 22, 35, 4, 31 is salubrious.
My 16, 25, 20, 4, 21, 32, 25, 4, 31 is more than handsome.
My 34, 17, 13, 7, 26, 14, 4, 28 is honorable.
My 8, 29, 30, 1, 16, 31, 17 is pleasing.
My 1, 29, 16, 11, 21, 4, 12 is the circuit border.
My 37, 31, 5, 24, 19, 9, 31, 27 is folly.
My whole is a faithful saying.

Rose, N. Y., 1854. C. B.

Answer to Illustrated Rebus No. 42.—*Sleeping foxes catch no poultry.*

Answer to Miscellaneous Enigma in No. 42.—*Know thyself.*

Answer to Charade in No. 42:

What is much older than the Sun
Would puzzle man to say—
He makes the present moment new
Because he rules the Day.

'Tis he makes day—by his degrees
To be both short and long:
And tho' he moves not, seems to run
His course as giant strong.

'Tis thus we say, the sun shall rise,
And never sit, but set;
The day flies very fast indeed,
Is every day's regret.

The sun was never described with feet,
Yet once was seen to stand;
And then the glorious day was won,
By Joshua's chosen hand.

The first and second—*Sun* and *Day*—
Together joined, present
Sunday, your comfort or your sin,
According as 'tis spent.

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

The Wool Grower and Stock Register is the *only* American journal devoted to the important and profitable branches of *Wool and Stock Husbandry.* It contains a vast amount of *useful* and *reliable* information on the above and kindred subjects, and should be in the hands of every owner or breeder of Sheep, Cattle, Horses, Swine, or Poultry—whether located East or West, North or South, for the most of the matter given in its pages is equally adapted to all sections of the Union, the Canadas, &c. The Sixth Volume, commencing July, 1854, will be

Enlarged to 32 Octavo Pages Monthly!

And improved in both Contents and Appearance. Among other matters of interest to Wool Growers, Breeders, Graziers, Dairymen, &c., the new volume will contain Pedigrees of Pure-Bred Cattle, Horses, Sheep, etc., and the Names and Residences of the principal Breeders and Owners of Improved Stock throughout the country. It is published in the neat style, and Illustrated with many Engravings—including Portraits of Domestic Animals, Designs of Farm Buildings, &c., &c. The careful Reviews of the Wool and Cattle Markets, given in each number, are alone worth many times the price of the paper.—To Wool Growers this feature is invaluable.

TERMS—Only Fifty Cents a Year; Five Copies for $2; Eight for $3,—*in advance.* Any additional number at 37½ cents per copy. Club papers will be sent to different post-offices, if desired. ☞ Back volumes (well bound in paper, for mailing) furnished at above rates.

☞ Now is the Time to Subscribe and form Clubs. Money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

☞ Mr. C. Moore, of Gerry, Chau. Co., is authorized to act as Agent for the Rural New-Yorker, and for the Wool Grower and Stock Register, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

Subscription—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the Rural,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the Rural is but 2½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

Advertising.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the Rural New-Yorker is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. BIXBY,—H. C. WHITE,—T. E. WETMORE.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete AGRICULTURAL, LITERARY and FAMILY NEWSPAPER.

☞ FOR TERMS, &c., SEE LAST PAGE. ☜

Progress and Improvement.

THE OHIO STATE FAIR.

Ohio is fast becoming, if indeed it is not already, the "Empire State" in Agricultural Products and Exhibitions. True, Western New York is far superior in soil, wealth, improvements, markets, &c., combined, to any equal extent of territory in Ohio—yet, as a whole, the latter surpasses New York as an Agricultural State, having much more tillable and highly productive land in proportion to its aggregate area. This will be conceded by all conversant with the facts in the premises; and hence, though the farmers of Ohio, as a mass, are far from equaling ours in arming themselves of the advantages of improved culture and management, the leaven which is spreading among, and inciting them, will ere long render theirs emphatically *the* Agricultural Commonwealth of the Union. Of late years the advantages and productiveness of Ohio are becoming patent to "the rest of mankind"—a development rapidly enhanced by the creditable Exhibitions of her noble State and numerous County Agricultural Associations. Herein the farmers of Ohio are manifesting a spirit of decided "Progress and Improvement"—for no State is her equal in the number, and perhaps perfectness, of organizations for the development and improvement of Agriculture.

The recent Ohio State Fair—of which favorable mention was made in our last, and concerning which we now purpose to speak more definitely—demonstrated, to a great extent, the capabilities of Ohio Soil, and the progress of its Cultivators. The Fair was, in most respects, highly creditable to the State and People,—altogether surpassing, in some important departments, any similar exhibition we ever attended. The grounds, occupying a portion of ancient works, near Newark, were to many visitors a most attractive and interesting feature. The centre of the grounds, containing about thirty acres, and embracing the horse and cattle rings, exhibition tents, &c., were surrounded by an ancient circular mound or embankment, with a ditch (like Gen. FILLMORE's,) on the inside. The embankment forming the circle is still some twenty feet in height from the bottom of the ditch, and on the top is a promenade from five to eight feet in width, from which the entire enclosure can be viewed—notwithstanding the grove of gigantic trees over and about the whole grounds. The diameter of this ancient enclosure is 1,250 by 1,150 feet, being slightly in the form of an ellipse. Our impression is, that the recent one was not the *first* Cattle Show on these grounds,—but that the Indians, or perhaps a preceding and superior race, occupied the same for catching, herding, or perchance *exhibiting*, Buffalo! It is proper to add that the Indian traditions convey no knowledge of the origin or purposes of these works. But to the Fair.

The exhibition fully equaled our expectations, though the display was limited in some departments. Some idea of the extent of the Show may be had from the number of entries in each class, or department, as follows:—Cattle, 270; Horses, 301; Sheep, 164; Hogs, 78; Poultry, 115; Farm Implements, 165; Farm Products, 98; Household Fabrics, &c., 237; Machinery, &c., 132; Mechanical Department, 58; Ceramic and Chemical Products, 27; Horticultural, 170. The number of *entries*, however, conveys no idea of the aggregate number of animals and articles exhibited—for in many instances one entry embraced from ten to twenty head of stock, specimens of fruit, or other items.

The show of IMPROVED STOCK was decidedly superior—excelling, in both numbers and quality, and in each department, any we had previously witnessed. Indeed, we doubt whether the display in the four principal classes—Cattle, Horses, Sheep and Swine—has ever been equaled in this country; and we certainly never saw, in either of the departments named, a superior exhibition.

In CATTLE the show was exceedingly large and fine—*the* feature of the Fair. The best improved and native breeds were well and numerously represented. Of *Short-Horns*, or *Durhams*, the show was extensive, and embraced many superior animals. Among others Messrs. PHILLIPS and FULLERTON of Woodstock, J. G. COULTER & Co., of Sligo, J. O'B. RENICK of Shadeville, W. D. PATRICK of South Charleston, H. RENICK of Darbyville, D. WILSON of Cincinnati, O. H. WOOD of Hanover, J. STEDMAN of Oregon, and E. FASSETT of Granville, presented very fine representative animals—including imported and home-bred specimens.

Of *Devons* the show was not so large, but it comprised many good animals. The herds of N. W. SMITH of Lebanon, Gen. BARKER of Greenwich, E. MATCHAM of Pittsfield, JOHN HADLEY of Clarksville, and others, were creditably represented.

The *Ayrshires* were also well represented. P. MELENDY of Mt. Healthy, showed six head, including two very superior bulls, 2 and 3½ years old, bred by W. H. LADD of Richmond. N. W. PENNY of Newark, and W. H. LADD of Richmond, also made a creditable exhibition.

The show of *Herefords* was quite limited, though THOS. ASTON of Elyria, and Mr. HUMPHREY, had several handsome animals on exhibition.

The Working Oxen and Fat Cattle included a number of noteworthy specimens, but we were unable to obtain names of owners—a difficulty, by the way, which we experienced in all departments of the Fair, as the animals and articles were only numbered. (It would redound to the benefit of parties interested, if the names of owners were given immediately after the passage or report of awarding committees.) THOS. MATHEWS, of Elyria, exhibited ten yoke of cattle which were very fine—the best we noticed on the ground.

In HORSES the exhibition indicated decided progress—the display being large, and many animals possessing all the substantial and popular requisites. The show of Stallions was particularly fine, fast and beautiful—including several superior blooded animals. Among these "Flying Cloud," a large and beautiful black horse, sired by old "Black Hawk," was conspicuous. A number of the best horses shown were Morgans, and of Vermont origin. The show in all classes was very creditable.—The displays and trials of speed attracted marked attention.

The exhibition of Female Equestrianism, on Friday, was witnessed by from forty to sixty thousand people, and deservedly created considerable enthusiasm and applause.

Of SHEEP the show was far the largest and best we ever saw,—and we were assured it surpassed any previous exhibition in the State. The various breeds and crosses classed under the heads of *Fine*, *Middle* and *Coarse-Wooled* were numerously represented. Of Spanish and French Merinos, many superior specimens were shown. BATCHELOR & HOUPE and T. S. HENDRICKHOUSE of Coshocton, H. S. MANON of Hebron, J. S. GAR of Tippecanoe, Pa., KIMBALL & CAMPBELL, A. V. STOCKWELL and others of Vermont, and JOSEPH MOSHER of Morrow, presented very superior specimens.

Of Saxons and Silesians there was a much larger and finer display than we anticipated—WM. H. LADD, of Richmond, making a superb show. GEO. W. POLLOCK, of Gratiot, also had a fine show of Saxons—as did others whose names we are unable to give.

The Leicesters, South-Downs, Cotswolds, and their crosses and grades, were likewise largely represented—making altogether a very fine exhibition. G. W. PENNY of Newark, showed a number of superior South-Downs. J. CHAMBERLAIN and Dr. TOWNSEND of Avon, WM. ALSHOUF of Utica, T. MATHEWS of Elyria, and others, made a fine display of Leicesters.

The show of SWINE greatly excelled, in all respects, any congregation of the genus *Sus* we ever before witnessed. The show of Suffolks was very fine—and we think they alone outnumbered any entire display at any exhibition ever held in this State.

The display of Poultry was fine and attracted no little attention. Such a show is well calculated to render *the* fever epidemic.

The show of Jacks and Mules,—as we ought to have said in the proper place,—was quite respectable.

Of Farm Products, Fruits, Flowers, Vegetables, &c., the display was not large—owing to the unfavorable season, and the location.—The exhibition of Fruit, however, was very fine—of Apples particularly creditable.

In Farm Implements, Machinery, &c., there was a good display, considering the location. The show comprised the usual variety, including several items worthy of notice—and a great many which the inventors or manufacturers assured us were perfect—each the *ne plus ultra* in its line; all which we patiently heard, but cannot conveniently advertise.—Among the Reapers, we noted ATKINS' Automaton, MANNY'S, MANN'S and HUSSEY'S.—EMERY'S Improved Railroad Horse-Power was exhibited in competition with all powers, and awarded first premium. There were several Grain Drills shown, among which SEYMOUR'S, and MOORE'S, were conspicuous. There were several matters, worthy of at least brief mention, in this and other departments, but we must omit or postpone additional particulars.

—In conclusion, the Fair was exceedingly creditable to all interested—especially Managers and Exhibitors. The arrangements were very complete, in most respects all that could be desired,—and we regard the members of the State Board entitled to particular credit for the successful issue of the exhibition.—The large display, fine weather, and numerous attendance, must have been gratifying to the officers and all other friends of Improvement.

BARLEY AS A HORSE FOOD.

One of our best Western Agricultural papers says: "Barley is an excellent food for horses, much better even than corn. *It is decidedly cheaper.*" That Barley is an excellent food for horses cannot be doubted. For a given weight, all things considered, it is perhaps the next best grain after oats. English farmers give their horses as much barley as oats. In fact, on the light land farms, the "work" horses seldom get a feed of oats,—barley, bran, ruta bagas, &c., being used as a substitute. The barley is of course ground. It is now, however, becoming quite common there to boil the barley instead of crushing it. It should not be boiled too long, as, besides the risk of burning, the horses do not eat it so readily. An hour's boiling, or till the barley begins to burst, is long enough. It should be taken from the boiler while hot and mixed with wheat chaff, cut straw, hay, &c., and the addition of a little salt makes it more palatable. We know of nothing that appears to fatten a horse quicker, or keep him in better health, than this food.

But because boiled barley is a cheaper horse food than oats in England, does it follow that it is the best and cheapest food that *we* can use? For the production of barley the long growing season and cool summer of the British Isles are superior to any other in the world.—We can raise much better wheat than the English, but the best barley we ever saw in this country would be considered unfit for malting purposes in England, while for Indian corn this climate is all that could be desired. In this climate, therefore, we believe it is impossible for barley to compete with Indian corn in furnishing nutritious food. It is at present grown with considerable profit; but this is owing to its selling for malting purposes for much more than it is worth as food for horses—and it is worth more as food for horses than any other animals. In other words, much more nutritious matter can be obtained for a given cost from a crop of Indian corn than from a crop of barley. But it will be said that corn is not such a healthy food for horses as oats or barley. We believe this is true, and probably owing to its containing such a large quantity of *available* carbonaceous matter, such as starch, oil, sugar, &c. If this be so, a highly nitrogenous food, such as peas or oil-cake, mixed in small quantity with the corn meal, would greatly improve it. The woody fibre, or *chaffy* matter of the oats or barley, could be well supplied by chaff and cut straw, mixed with the corn and pea or oil-cake meal.

We feel sure, therefore, that while barley *is* an excellent food for horses, it is not "decidedly cheaper" than corn, and when corn is judiciously fed, as we have suggested, it may be questioned whether it is "better even."

WHEAT GROWING IN MASSACHUSETTS.

WHY wheat will not grow in Massachusetts, is a question we have frequently asked, but to which we have never yet received a satisfactory answer. The *New England Farmer* has an article on the subject, from which it appears that twenty-five years ago "it was well known that wheat could not be raised in Massachusetts," the reason being, the "land was too old." The *Farmer* combats this assertion by reference to the "Old Countries" of Europe, where wheat has been grown for centuries. It says, too, that since the establishment of Agricultural Societies, and the increased circulation of farming newspapers, some bold innovators have tried the experiment of growing wheat, and have found "that wheat, though not considered so certain or so profitable a crop as corn, may, notwithstanding, be raised to advantage in the State." It thinks that the average wheat crop of the best districts in this country falls far below that of the wheat crop of "old" England. As we have such a variety of climate in the wheat growing districts, our short comings must be attributed to one of two causes—soil or seed.—"There are two principal requisites in soils for wheat. According to the opinion of most farmers, the soil should be rather a stiff, tenacious, clayey soil, and not mellow, light, or loose. We think it should not be too rich also. In a mellow, light and rich soil it makes straw at the expense of the grain. *But the main requisite in the soil for ultimate of the plant is phosphate of lime.* To this condition, or to the seed, or to both, the greater success in England, in wheat growing, is to be attributed.—England is a limestone country, and the farmers use bone manure, which furnishes the phosphate of lime on their fields. The most of the western wheat growing lands are in a limestone country, but the soil is too light and mellow, favoring straw too much." We do not think the "greater success" of English wheat growers is attributable to seed. Nor is the idea that it is owing to the increased proportion of phosphate of lime in the soil at all consistent with facts. It is true, English farmers "use bone manure" and super-phosphate lime, but it is exceedingly rare that they are applied to wheat. In fact, it is clearly indicated, not to say demonstrated, that in ordinary English agriculture an application of phosphate of lime to wheat is attended with no benefit.

Indian corn contains quite as much phosphate of lime as wheat, and if corn can obtain all the phosphate of lime it requires from the soils of New England, why cannot wheat?—We are inclined to attribute the poor wheat crops of New England more to an imperfect mechanical condition of the soil, than to any deficiency in the mineral elements of the wheat plant. Were the farms in Massachusetts thoroughly underdrained, sub-soiled, and plowed so as to *well pulverize* a few inches of the surface soil, rather than flopping over a deep *wide* furrow,—were more peas, roots and clover grown, and the land heavily stocked with sheep so as to consolidate it as much as possible, as is done on the light land farms of England, we believe as large wheat crops might be grown in New England as on any farm in Old England on which artificial manures or cattle foods are not used.

The *Farmer* cites a great many instances of immense English wheat crops. It is true that the wheat crop in England is heavier than in this country, but it must also be remembered that wheat, and especially meat, commands a higher price than with us, enabling the British farmer to use an immense quantity of artificial manure, to grow an enormous quantity of root crops, and to purchase largely of American oil-cake, Egyptian beans, &c., which being consumed on the farm by sheep and cattle tend greatly to its enrichment. No wonder that, under such circumstances, the yield of wheat is greater than in this country, where much of our land is never manured.

The *Farmer* thinks the quality of the English wheat is superior to ours, and, after mentioning instances in which English wheat weighed from 62 to 64 lbs. per bushel, says:—"We think no wheat has ever been grown in this country at 64 lbs." Except in rare seasons, that of 1846 for instance, English wheat is much lighter and inferior to our Genesee wheat. When cleaned as well as English farmers clean their wheat, our Genesee and Canadian wheat is altogether superior to the best English samples, and makes whiter flour. We saw at the recent Michigan State Fair at Detroit, better, drier and heavier samples of wheat than we ever saw in Mark-Lane, or any other grain market in Great Britain.

CONVERSATIONS ON AGRICULTURE.—No. VII.

BY HUGH T. BROOKS.

ABOUT THE NEW YORK STATE FAIR.

I ATTENDED the late State Fair at New York; there were many things connected with it of permanent interest, and I take the first leisure time which I could command to notice them. There were present quite a number of mules of larger size, and finer appearance than I had ever before seen. I saw eleven span attached to one wagon, all of which were from fourteen to seventeen hands high, and would weigh 12 or 14 hundred; they belonged to a gentleman in New Jersey, who informed me that he works a farm of 3,000 acres with mules, and finds great advantage in so doing. He represents them to be nearly or quite free from the ordinary diseases and defects of horses, and if, perchance, anything should happen to them, turn them out a while and they will get over it. They will do the same work as horses, on about half the grain. They will never refuse to work under the seductive influences of coaxing and flattery, but like "the rest of mankind," they are a little "*mulish*," and prefer not to be kicked and cudgeled. I had no idea they ever attained the size and power they do. I saw two span well broke and very manageable and docile, owned in the city of N. Y., which took the first premium; they would certainly come up to the greatest size and weight mentioned above. Mules are coming into use very much in New York. A prominent business man of that city, Mr. WM. WILMERDING, informed me that his son had a span which drive very handsomely and make good time, performing a mile in less than 4 minutes with ease. Let Fashion and her colts look out for their laurels; the mules will be after them yet.

I am determined to embark in the breeding of mules and *I hope that every town that has'nt a jackass!* will at once get one—I mean one of *the genuine, long-eared variety*—we must "conquer our prejudices";—the animal has been damaged by *unworthy associations*, and I think ought to be permitted to call upon the *courts* for redress.

I was told that a large jack with good proportions, would cost in Kentucky, $600 to $800, and in some cases a thousand. Let us start right, even if it costs something. I believe our farm work can be done twenty-five per cent. cheaper with mules than with horses or oxen, and in this opinion I am sustained by my neighbor, Mr. MORGAN, who has worked them in this State and in Ohio. My friend WILMERDING, of New York, triumphantly asked, "Who ever saw or heard of a dead mule?"—

Their longevity is remarkable, and while they are as easily kept as oxen, they are more expeditious. Success to the long-eared tribe!

I saw in constant motion a neat wind-mill for pumping water, and I commend it to the very distinguished consideration of every man who has a pasture not supplied with Nature's wholesome beverage. In our extreme hot weather, animals, *including sheep*, require to drink a great deal, and to drink often, and they need to have it at hand, and not be obliged to make a long journey to get to it. Last Sept. I had a flock of 300 lambs, in a field without water, and believing I could find it by digging, I caused a hole to be made 4 or 6 feet deep when the water appeared. I caused the ground to be planted down to the water on one side, so the sheep could get access to it. During a very hot day, the anxiety to drink was so great that the whole flock crowded round the place and the external pressure was so great as to completely smother or drown fourteen of my lambs, and but for the interposition of my men, as many more would have been dead in a few minutes. Who will say that sheep do not need water? I have not the name and address of the manufacturer of the wind-mill, but it can be ascertained by looking over the list of entries at the State Fair. A very little wind turns the machine, and a reservoir can be made to hold enough water to last through a calm.

Being one of the judges on Short-horns, my attention was particularly called to the beautiful display of Durhams, both imported and natives, which graced the exhibition. I am compelled to award great praise to the gentlemen whose liberality and enterprise has done so much for the improvement of our stock.

Without good *models* to form and guide our opinions and judgment we cannot know what excellence is in any department. Messrs. Vail, L. F. Allen, Sherwood, and more recently, Messrs. Thorn, Hungerford, and Brodie, Bedar and Morris, and several others have furnished us with the best animals from the best herds of foreign countries.—Their recent importations are doing much to correct those points wherein Short-horns have been most deficient. Mr. Morris informed me that he had taken pains to procure animals from such families as were celebrated for milk, and I am aware that my friend Sherwood, of Auburn, has acted in reference to the same thing, in his selections from the celebrated *Princess* family. Indisputably, the great *idea* of a cow is *milk*. I have in my mind, a Short-horn yearling heifer, lately imported, I should think, by Mr. Hungerford, which was remarkably well filled back of the shoulders, where Short-horns are usually deficient. Much attention is now given by intelligent breeders to the coat, which should be thick and fine; in my judgement, the more hair the better; it is needed in our long, hard winters to keep the animal warm.

The famous South-Down buck, imported by Mr. Morris, from the celebrated Jonas Webb flock was exhibited; he was symmetrical and well developed, extremely so. The Suffolks are the *fashionable* pigs. They made a good show. Col. Sherwood, of Auburn, presented two, which I have never seen surpassed. Their meat is said to be more tender than the Berkshire, and they will fatten at any age, which is a qualification of the first importance.

The *mechanical* department, which I supposed would *excel*, was the most *deficient*, unless the distinction is due to fruits and flowers The American Institute and the Horticultural Society, seem to have done very little for the Fair, though they were understood to co-operate in the exhibition. Great credit is due to some enterprising farmers in the vicinity of New York, but the city generally was either above or below the great agricultural level.

Pearl Creek, Oct. 4, 1854.

A choice lot of Poultry.—The steamer Washington brought over a very superior collection of poultry, selected with great care from the best breeders of Great Britain, France and Germany, by John Giles, of Woodstock, Ct. They are at present on exhibition at Barnum's Museum, New York, and will be sold by public auction in a few days. Barnum and Humbug are considered synonymous terms, but from a short visit we made to these fowls last week, we could discover no humbug about them. Though suffering a little from the voyage, they are, as a whole, the finest collection of poultry we ever saw. Some of the breeds of Geese, and Ducks, and the Dorking, Surrey and Black Spanish fowls, were very superior. Some Cotswold and New Oxfordshire Sheep, said to be on exhibition, we could not find.

Vitality of Eggs.—A correspondent of the *Poultry Chronicle*, on a recent visit to a Gipsey's tent, found "in one corner of the cart, a hen sitting upon a seat of eggs, and some of her chickens hatched." On inquiry he found that though they frequently travelled many miles during the setting period, they had generally good luck with their hatches.

MADISON COUNTY AGRICULTURAL FAIR.

The Annual Fair and Cattle Show of the Madison County Agricultural Society, was held at Morrisville, the 19th to 21st of September last, and I should have favored the Rural with an earlier notice, had I not anticipated you would received the account from another.

The first days of the Fair were unfavorable to the exhibition, it being rainy, but notwithstanding this the Show, all things considered, was far superior to any thing its most ardent friends could have anticipated, and was pronounced by persons best competent to decide, as far superior to any exhibition previously held in the county.

The Show of Cattle, Horses, Sheep, Swine, and Poultry, both imported and bred from imported stock, attracted much attention and commendation and it is considered very doubtful, quality considered, if their superiors can be produced in this country.

The ladies' department was hardly as well represented as usual, yet there were many meritorious articles which justly elicited much praise for their fair exhibitors. It is only hoped that this part of the exhibition may be fully represented another year, together with the mechanical department and the Madison County Agricultural Society cannot *then* fail (if it has not already attained this position) to stand *first* among County Ag. Societies.

I must not fail in this connection to notice the "Ladies' Riding Match," by far the most attractive feature of the exhibition, and which drew to the grounds, I may safely say, thousands of spectators. There were but few competitors, this being the first year the Society have offered these premiums, and many ladies no doubt thro' diffidence hesitated to compete. Another year and there cannot be a doubt but that this match will be fully represented, and it is already considered that it will be necessary to have two classes to accomodate the fair equestrians.

Great praise is due the able superintendent of Floral Hall, and the ladies and gentlemen of this committee, for the beautiful style in which they decorated the large Hall in their charge, and for the efficiency of all of their arrangements.

The Madison County Agricultural Society has a permanent location at Morrisville which occupies seven acres (about one-half of which is a beautiful grove.) They have a large building 50 by 60 feet, two stories, well battened and shingled for their in-door exhibition situated within this enclosure, together with business office and all necessary fixtures, and it is confidently hoped and expected that its future exhibitions will continue to increase in usefulness and interest. C.

Cazenovia Town Fair.—A correspondent at Cazenovia gives us an account of the first Fair of the Farmers' and Mechanics' Association of that Town; showing that the matter has been taken up with a spirit which ensures success. The organization was started only two weeks before the exhibition, which took place on the 25th ult. The Show was fine in Stock, especially Sheep and Swine, the Dairy, Domestic Manufactures and Fruits, and excelled in the display of fancy and work Horses, —a large number being on the grounds. The show of Poultry was also excellent. Six or eight thousand persons were present, and the occasion was as gratifying as successful, and will encourage future and higher effort.

Harrowing Wheat in the Spring.—A correspondent of the *Michigan Farmer* says that Mr. James Worthington, of Homer, Michigan, had last spring a lot of wheat which looked so bad that had not the field been seeded down to clover he should have plowed it up and sown it with spring crops. Instead of doing so, he took a "sharp strap harrow" and with it "tore the land thoroughly to pieces." He then rolled it down with a smooth, heavy roller. This covered the roots again and they soon took hold and the wheat began to improve. The field contained some 40 acres, and the result is that "every acre of it will probably yield over 15 bushels and a majority over 20 bushels" per acre. The harrowing and rolling of wheat in this manner, has been several times recommended in previous volumes of the *Rural*.

Gigantic Ear of Oats.—The editors of the *Blackburn Standard* had recently handed to them an ear of oats grown by Mr. Cronshaw, of Belthorn, which contained *two hundred grains*.

To Fatten Fowls.—Fowls may be fattened in four or five days by the following process:—Set some rice over the fire with skimmed milk, as much only as will serve one day; let it boil till the rice is swelled out; add a tea-spoonful of sugar. Feed the fowls four or five times a day in pans, and give them as much each day as will fill them. Great care must be taken that they have nothing sour given them, as that prevents their fattening. Give them clean water or milk from rice to drink. By this method the flesh will have a clear whiteness.

DETERIORATION OF WHEAT.

A correspondent of the London *Mark Lane Express* from Northumberland, Newcastle District, C. W., after speaking of the destruction of wheat by the weevil, and saying that the only alleviation yet discovered—late sowing—presents in that climate greater risks than the disease, alludes to the deteriorating effect of cold winters and short hot summers on the wheat plant. Without endorsing his observations, we commend them to the consideration of our readers. We think *early* sowing a more likely means of alleviating the injuries from the weevil than *late* sowing, and according to the views of this writer it would be to our interest to get seed wheat from Virginia or other Southern States. We have some doubts, however, whether such wheat would ripen much earlier than that grown here. If any of our readers have experience on the point, we should be glad to hear from them:

It is a singular fact, that any variety of wheat grown here degenerates most rapidly.—Seed which at its introduction was most prolific, in four or five years becomes sterile and worthless, even when an annual change of soil and situation has been most carefully attended to. This seems to indicate an unfitness in our climate for fully maturing the powers of the plant, and to point to a trade which must ultimately here become very extensive in the importation of seed from more favored latitudes. English seed seem not to have an early enough habit for us, and consequently the finer varieties rust before maturity. With the red wheats this seems not, however, to have been the case.* The early harvest countries to the south, with which we have an easy communication, seem thus pointed out as our nurseries. We would, however, like to draw the attention of English farmers, (in late districts,) to the consideration as to whether our quickly-matured grain might not be valuable to them as a seed, enabling them to compete on better terms with more favored quarters. A plant, like an animal, when it has once acquired certain habits, only loses them by degrees.—It would take many years of neglect and starvation to cause the mellow pippin to revert to the stingy crab from which it originated; so grains which have been hurried to a ten-week maturity by a scorching sun and a dry atmosphere, will not at once forget their ways, even under the leaden skies and grey east winds of a northern island climate. On this principle we have no doubt that many of the hulkier seeds might, by English farmers, be with advantage imported from Canada.

PREPARING POULTRY FOR MARKET.

The *New England Farmer* says:—We have often noticed the careless and shrewdy manner, and little attention paid to the external appearance of poultry offered for sale in our markets; and we have likewise noticed the ready sale and higher price where due regard was paid to have the skin all sound and clean; the breast not mutilated by a long cut, the shrinking skin exposing the drying meat covered with hay seed or chaff; but well covered all over with fat, of a rich golden yellow. Much of the poultry exposed for sale has been thro' the process of scalding to facilitate the picking; this practice should never be resorted to. It turns the rich yellow of the fat into a lallowy hue, and oftentimes starts the skin so that it peels off, unless very carefully handled. No cut should be made in the breast; all the offal should be taken out behind, and the opening should be made as small as possible; the insides should be wiped out with a dry cloth, but no water should be used to cleanse them. With a moist cloth take off the blood that may be found upon the carcase. In picking, great care should be taken not to tear the skin; the wings should not be cut off, but picked to the end; the skin of the neck should be neatly tied over it, if the head is cut off.—Most people like to see the heads of fowls left on—it makes a better show. The heads of ducks and geese should not be cut off.

Bement says:—much care and attention are required after the poultry is dressed and cool, and it should be carefully packed in baskets or boxes, and above all, it should be kept from freezing. A friend, who was very nice in these matters, used to bring his turkeys to market in the finest order possible, and always obtained a ready sale and the highest price. His method is to pick them dry, and dress them in the neatest manner; then take a long, deep, narrow box, with a stick reaching from end to end of the box, and hang the turkeys by the legs over the stick, which prevents bruising or disfiguring them in the least.

Too much should not be exposed at a time for sale, nor should they be hauled over too often. Appearance is everything with poultry, as well as other articles, and has great influence on the purchaser.

"Lazy bed" Potatoes.—We have often heard of raising potatoes by dropping them on the top of the ground and covering them with straw or litter, giving no other cultivation.—We are told that this is what is called in Ireland the "lazy-bed" system. Mr. W. D. Phelps, of Lexington, has sent us a sample of potatoes raised by him in this way. They are very handsome. He says—"The seed was spread broadcast on plowed ground, and covered with straw and hay, a few shovelfuls of soil scattered over the covering, just sufficient to keep it from blowing away. When the tops were about six inches above the covering of straw, they were again covered with green grass. No other tillage was done, and at the gathering, the covering was removed and the potatoes picked up. The yield was 1½ bushels to the rod."—*Boston Cultivator.*

Bone Wen.—A writer in the Boston Cultivator says that bathing with Spirits Turpentine once a day will cure a bone won. Doubtful. *Prairie Farmer.*

NATIONAL CATTLE SHOW.

This show, held last week at Springfield, O., is reported to have passed off creditably. In the absence of further particulars, we can only give the following abstract of the premiums awarded, as reported by telegraph:

Short-horns.—*Bulls*—3 years and over.—1st, 'Perfection,' Edw. G. Bedford, Paris, Ky., $300. 2d, 'Shellfish,' J. W. Robinson, Madison, co. O., 200; 3d, 'Belmont,' Cahtwell & Co., Fayette co. Ind., 100. Two year olds—1st, 'Locomotive,' Brutus J. Clay, Paris, Ky., 200; 2d, 'Colonel,' R. G. Dunn & Co., Madison co. Ind., 150; 3d, 'Lafayette,' J. M. Sherwood, Auburn, N. Y., 75.—Yearlings—1st, 'New Year's Day,' Chas. M. Clark, Springfield, O., 150; 2d, 'King Cyrus,' Geo. M. Bedford, Paris, Ky., 100.

Cows.—3 years old and over.—1st, 'Lady Stanhope,' E. J. Clay, $200; 2d, 'Duchess,' Wm Pulmer, Fayette co. O., 150; 3d, 'Clara Fisher,' S. Meredith, Cambridge, Ind., 100. Two years old.—1st, 'Fashion,' J. Stoulden, Warren co. O., 150; 2d, 'Laura,' B. J. Clay, 100; 3d, 'Mary Clay,' S. Meredith, 50. Yearlings.—1st, 'Lowan,' J. Duncan, Paris, Ky., 100; 2d, 'Easter Day,' C. L. Clarke, Springfield, 75.

Devons.—*Bulls*—3 years and over.—1st, 'Know Nothing,' N. W. Smith, Warren co. O., $100; 2d, 'Herod,' L. G. Collins, Montgomery co. Ind., 75. Two years old.—1st, 'Moulton,' L. F. Allen, Buffalo, N. Y., 80; 2d, 'Jake,' E. Merritt, Clark co. O., 60. Yearlings.—1st, 'Premium,' L. G. Collins, 60.

Cows.—3 years and over.—1st, 'Sapplee,' L. F. Allen, $100; 2d, 'Francis,' L. G. Collins, 75. Two year olds.—1st, 'Dolly,' E. M. Merriweather, Tobi co. Ky., 75; 2d, 'Deron,' N. W. Smith, 50. Yearlings.—Heifer, L. G. Collins, com.

Herefords.—*Bulls*—3 years and over.—'Curley,' Thos. Aston, Elyria, O., $100. Two year olds—'Mystery,' W. H. Sotham, Tioga co. N. Y., 80. Yearlings—'Defiance,' Thos. Aston, 75.

Cows—3 years and over.—'Bellhayle,' W. H. Sotham, $100; 2d, 'Duchess,' Thos. Aston, 75. Two year olds—1st, W. H. Sotham, 75.

Ayrshires.—*Bulls*—3 years and over.—'Danby,' P. Melendy, Hamilton co. O., $100. Two year olds.—'Wallace,' T. W. Barber, New Paris, Ky., 80. Yearlings.—'Ducas,' P. Melendy, 75.

Cows—3 years old.—'Lassie,' P. Melendy, $100. Two year olds—'Alice,' P. Melendy, 75.

Jerseys.—*Bulls*,—3 years and over.—'Pat Smith,' R. L. Colt, Patterson, N. J., $100.

Cows.—3 years and over.—'Dun,' R. L. Colt, $100. Two year olds.—'Jersey,' R. L. Colt, 75. Yearlings.—'Patty,' R. L. Colt, 60.

Miscellaneous.—Working Oxen—C. Fullington, Union co., O., $50. Fat Ox—B. Stedman, Cleveland, O., 50. Fat Cow—J. W. Ware, Fayette co., Ky., 50. Milch Cow—J. W. Brick, North Petersburg, O., 50. Steer—J. W. Ware, 50. Bull Calf—W. D. Pierce, Clark co., O., 50. Heifer Calf—W. W. Thrasher, Fayette co., Ky., 50.

PREMIUMS ON AG'L IMPLEMENTS, &C.

The following are the most important of the premiums awarded on implements and agricultural machinery, at the late N. Y. State Fair:

For the most valuable machine or implement for the farmer, newly invented, Halliday, McCray & Co., Ellington, Conn., for self-regulating wind-mill for elevating water or other motive power, Dip. & Silver Medal. Fisk Russel, of Boston, Mass., for his new application of oscillating and reversable knives to the mower and reaper, and Cain, for communicating such motion, Dip. & S. M. Henry Waterman, Brooklyn, L. I., for his new application of oscillating motion to the cutting bar to mower and reaper, dip. & S. M. Best hay and cattle weighing Scales, Fairbanks & Co., St. Johnsbury, Vt. $20; best Hay Press, Deering & Dickinson, Albany, Dederick's Patent Hay Press improved. S. M. Best improved Drain Tile, Appleton & Ahlerson, Albany, $5; best church and steamboat Bell, Meneely's Sons, West Troy, Dip.; best Wire Fence for farm purposes, cost of construction, and evidence of its adaptation to practical and economical uses considered, M. P. Corns, 180 Broadway, New York, $10; best collection of Plows in this country, R. L. Allen, New York, dip. & S. M.

Mowers.—Howard & Co., Buffalo, (Ketchum's pat.) best Mower with the reciprocating bar, dip. & S. M; Thomas D. Burrall, Geneva, 2d best do. with do., dip; M. Hallenbeck, Albany, for a simple and excelling compact Mower, dip; J. J. Weeks, Buckram, L. I., a novel arrangement of geering to Mower and Reaper, dip.; John Adriance, Poughkeepsie, for workmanship and good arrangement of geering to a Mower, dip.; American Mowing and Reaping Co., Buffalo, (Forbush's pat.) for a novel arrangement of clamps for elevating and depressing the cutting bar, dip.; J. S. Wright, Chicago, Ill., Atkins pat. Self Raker, an ingenious and novel raker, dip.

Reapers and Mowers in Combination.—Eugene Snyder, Elizabethtown, N. J., Ketchum's patent Mowing and Reaping Machine with side delivery, dip. & S. M.; Thomas D. Burrall, Geneva, Mower and Reaper, dip. & S. M.; Walter A. Wood, Hoosick Falls, Manny's Mower and Reaper with Wood's improvement, dip. & S. M.

Horse Powers.—H. L. Emery, Albany, Emery's Endless Chain Horse Power—best, S. M.; G. Westinghouse, Central Bridge, N. Y., for an excellent endless chain Horse Power, dip.; Wm. McCord, Sing Sing, best sweep Horse Power, S. S. M.; Eddy, Dyer & Co., Union Village, Washington county, an eight horse sweep power improved, dip.

Grain Drills.—Bickford & Huffman, Macedon, Wayne Co., best Grain Drill, with seed and fine manure attachment, dip. & S. M.; P. Seymour, East Bloomfield, N. Y., an excellent broad cast Sower and Seed Drill, with grass and fine manure attachment, dip. & S. S. M.; Foster & Jessup, Palmyra, N. Y., a good Grain Drill with cast iron feeders of novel construction, dip.

Waste Manure.—The *Maine Farmer* felicitously says:—"When farmers see the crows pulling up and carrying off their corn, or the rats get in and destroy their grain or potatoes, they at once realize their loss, and immediately take measures to stop and prevent it. But many of them lose more corn, more grain and potatoes, by neglecting to protect and preserve their barn-yard and compost heaps, than is annually destroyed by all the crows, and rats, and other *varmints* in the State.

California Products.—The Californians boast largely of their big turnips and potatoes. Two turnips are mentioned, weighing 29 and 36 lbs. each, and a sweet potato weighing 9 pounds.

LESSONS OF THE PAST SEASON.

We are much mistaken if the wheat-midge or weevil does not do us some substantial good. Crops of wheat which have been put in early and in the best manner, in land not injured by previous mismanagement, have been but slightly affected. An energetic farmer of our acquaintance prepared his land last year, by first turning over *deeply* a good clover sod—then giving this a good coat of compost manure—then harrowing the inverted soil and compost into complete intermixture and pulverization—then turning the whole under with a gang-plow just deep enough for the roots of the young wheat which was put in with a drill in the best manner. The whole of this was accomplished by the first day of autumn. Other crops on the same farm, after corn, were also well put in, but necessarily some weeks later, and in less favorable soil. Now mark the result. The first-named crop yielded the present season of drouth and insects, no less than thirty bushels of the finest wheat per acre—the other was only ten bushels per acre. Other crops in the same neighborhood, sown after corn with only ordinary care and tillage, produced but five bushels per acre. In one instance, when two fields were sown side by side, on similar land, at the same time, but with one of them thoroughly tilled with an especial view to the destruction of "June grass," the latter yielded nineteen bushels per acre, the former only ten. Examples may be multiplied to any degree, showing the great profits of the best modes of tillage for security against these depredators.

The present year of extraordinary drouth has furnished some interesting lessons on the difference between the effects of good and bad management. The potato crop, for example, has varied five hundred per cent. with the treatment it has met with. When it has been planted *early*, in a soil not made rich lastily with fresh, badly mixed manure, but by previous high tillage, with an addition of well pulverized compost, we have succeeded to raising large and fine roots. Late planted, and on poor soil, the crop has in many instances been insufficient to pay the digging. The Irishman who dug our crop, said he was quite as well rewarded for his labor by taking one bushel in *ten*, as in taking the *whole* of his own scanty product. The *out* crop is another which has exhibited in a striking light, the advantages of being *up to the time*. Crops which were sown closely after the disappearance of frost, have afforded a fair return; while some which we have had occasion to notice that were put in but two or three weeks later, reminded us of such as were fit only to cut with scissors and rake with a pocket-comb—they could not, in fact, be cradled.—*Country Gent.*

Inquiries and Answers.

Sowing Apple Seeds.—When should apple seeds be sown, in the fall or spring; and can you give me any information as to preparation of the ground, method of sowing, management, &c.? and oblige.—Stephen Angell, Jr., *North Chili, N. Y.*

Apple seeds must be sown in the fall. The land should be a dry, light, rich loam, worked till it is quite fine and mellow, and free from all weeds. Some sow the seed broadcast. This is not a good method, as in such a case it will be difficult to keep them clean the next summer. Others sow them in broad drills, say six inches wide, and 15 to 20 inches between the rows. This is a better plan, and is the one commonly adopted. It appears to us, however, that the rows might be a little closer, say 12 to 15 inches, *and the drill much narrower.* With drills six inches wide, there must be considerable hand weeding, which in a narrow drill would be unnecessary. The seeds should be scattered in the drills quite thick. In a narrow drill they should cover the ground.

Australian Wheat.—What is your opinion of Australian Wheat? I see some of the agricultural papers are "cracking it up." Is it really a superior seed wheat, worth $3 per bushel, as some ask for it?—John Price, *Mount Healthy, O.*

Australian Wheat in this vicinity has proved a decided failure. It will not stand our cold winters, and does not ripen well, unless the summer should chance to be unusually hot and dry. In Virginia, Kentucky, and Southern Ohio, it is said to do well. It is unquestionably a fine wheat, with a large, long, heavy berry, containing much gluten, and making very superior flour. At least this is true in reference to the real Australian Wheat, grown in the Colony, and samples of which we saw and analized in England, some years ago. But that it will be found a valuable wheat, for the latitude of Western New York, is, to say the least, very doubtful.

Scientific Agriculture.—I wish to become familiar with the science of agriculture, and thinking you well posted on the subject, I should feel obliged for any information you can give me as to where it can be obtained, &c.—J. C., *Mourocille, Ohio.*

A careful study of Johnston's Elements of Chemistry and Geology, and lectures on Agricultural Chemistry, of Boussingault's Rural Economy, Mulder's Chemistry of Vegetable Physiology, Morton on Soils, and Liebig's writings on Agricultural Chemistry would give a young man considerable theoretical acquaintance with scientific agriculture, but an intimate and practical knowledge of agricultural chemistry—and Chemistry is but one branch of the science of Agriculture—can be obtained only by systematic study under proper teachers, and by actual investigations in the laboratory.

Orchard and Garden.

ASPARAGUS.—ITS GROWTH &c.

Ens. Rural:—I have occasionally seen statements respecting the rapid growth of plants and shrubs, but have seen none equal to that which I am going to relate. One year, being at work in my garden about the middle of June, I noticed that in the time I stood there, (about 3 hours,) the stalks of asparagus in a bed by which I passed, had grown very rapidly. It occurred to me that it would be well to ascertain how much a few of the largest would grow in a given time. Having prepared 4 stakes, I drove them into the ground, each by the side of a stalk then about two feet in height. From 4 o'clock to 8 P. M., they had grown from 2 to 2½ inches each. I left them until 8 o'clock P. M., of the next day, and then measured the several growths of the *twenty-four hours*. They were as follows:—No. 1 had grown 12½ inches—No. 2, 12 inches—No. 3, 10½—and No. 4, 10. These growths occurred in a bed which was planted about *fifty years* ago, in land that was never plowed. The plants have never been renewed, nor replanted, excepting that new plants may have sprung up from the seeds which fell from the stems annually.

My course of cultivation is a very simple and easy one. I have made it a general practice, annually in November, before the ground freezes, to cover the bed with good rich barn-yard manure, some 8 or 9 inches in depth,—I let that lay on the bed *leaching*, until the spring opens in April. As soon as the sun begins to warm the surface of the earth, I remove the coarser parts of the manure, leaving the finer portion (if any) on the bed. The bare surface of the bed being thus early exposed to the rays of the sun, is soon warmed so that the asparagus roots begin to grow.—By this course of management I have the shoots ready for use some two weeks earlier than if the manure was (as is usually recommended,) left on the bed, forming a thick coat of earth and manure to be warmed through, before the roots felt the warmth of the sun.—Perhaps by "digging in" the manure, *larger stalks may* be obtained. But the depth of earth over the roots retards the growth of the plants. And when grown, the "*beautiful white*" *parts are not eatable*. The *green* parts only are worth cooking. J. H. H.

ON THE PRESERVATION OF GRAPES.

Ens. Rural:—The impression prevails in community to a great extent, that grapes cannot be kept for winter use in a fresh or undried state—or that if they can be so kept, the trouble and expense of keeping them will be so great that few persons, comparatively, can afford to make the attempt. It is for the purpose of attempting to dispel this erroneous impression, that I now address your readers.

While the most rapid advances have been, within a few years past, made by fruit growers in the improved culture of all known varieties of good fruit, as well as in the production and dissemination of excellent new varieties, it would seem that we have remained nearly stationary in respect to the proper preservation of many kinds of fruit for use during winter.

The fruit now under consideration has been kept in a good state of preservation all through the winter, and even till May, by various modes. They have been kept by putting them in kiln-dried saw-dust, in cotton wadding, in sand, in hard maple shavings, and between layers of clean dry paper, &c., in boxes of convenient size. Some of these modes, though effective, are quite objectionable, as the fruit is liable to become defaced in the operation. I am now satisfied that grapes may be preserved in a fresh state, any reasonable length of time without the use of any of these materials—to do so, it is only necessary to heed the following suggestions:

Let your fruit be properly ripe before you gather it; or if there are any unripe or defective berries on the stems, remove them with the scissors. Spread the grapes thinly on shelves in the fruit room, and keep it dark and as cool as you can, and let the air circulate freely among them. This treatment will cure the stems in three or four weeks, so they will be almost as hard as wire. When this result is accomplished the grapes may be placed in boxes containing from six to twelve lbs. each, and stored in a dry cellar or other room where they can be kept uniformly *dry* and *dark*, and at a temperature ranging from 35° to 40°.—Light, as well as warmth, has a tendency to cause fermentation. The nearer they are kept to the freezing point, the better it will be; but the range of temperature indicated will do, as fermentation will not take place below 42°.

E. A. McKay.

Naples, Ontario Co., Oct. 20, 1854.

Hardy, bulbous roots, such as hyacinths, tulips, crown imperials, lilies, narcissus, &c., can be planted as long as the ground remains open; but the beds should be immediately covered a few inches deep with litter.

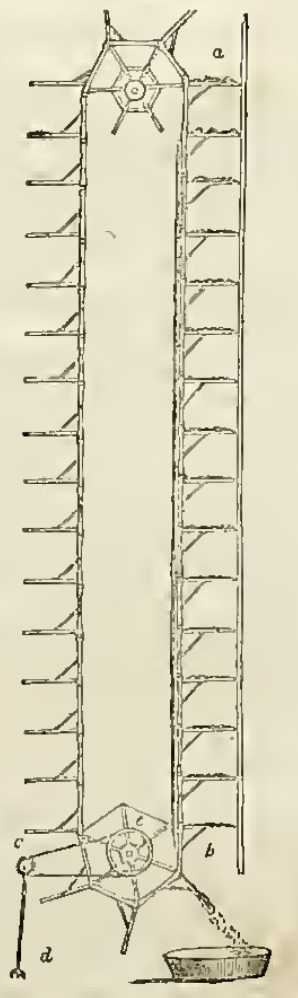
DRYING FRUIT.

It has been observed that the amount of Peaches consumed in a single week in the city of New York, exceeds the total consumption of fruit in Great Britain throughout the entire year. The sales of perishable fruits are rapidly increasing throughout the country; but there is one serious drawback to their extensive cultivation—that is the necessity of crowding them into market at the critical period of their maturity, so that twenty-four hours' delay shall not witness their destruction by decay and fermentation, and result in their total loss. Hence the immense superiority in this particular, of long-keeping sorts—which may be deliberately secured and held in market for many months, till the best time shall be selected for their disposal.

But there is another important avenue to market for the perishable fruits that is at present almost unknown in its perfected form We allude to its preservation by drying.—Every farmer thinks he has seen dried apples and peaches, but not one in a thousand has seen them—properly so called. That which usually appears under this name, consists in the first place, of a selection of such inferior, poor-thinned fruit, as can be used for nothing else; this is imperfectly pared, leaving a due proportion of skin and core remaining, and is then variously subjected to partial decay, smoking, drying, &c., forming when completed, a singular medley of all colors, from brown to nearly black, and with nearly as various an intermixture of flavors. Those who wish to see dried fruit in perfection, must remember that a poor flavored sort before drying can never by any ingenious process become finely-flavored afterwards. The very finest varieties must therefore be first chosen. The process of drying must then be so rapid that no decay nor even discoloration shall take place until the operation is completed. Our climate is too precarious to think of drying fruit properly in the open air, even for the earliest varieties. Some artificial arrangement for the purpose must therefore be devised.

The great leading defect of all the plans we have seen for drying by fire-heat, is *a want of circulation in the heated air*—a deficiency in rapid ventilation. A high temperature is given by means of stoves to a close apartment, the air of which in a few minutes is heavily charged with moisture from the fresh fruit, and a sort of steaming, stewing, half-baking process then commences, producing after a long delay, an article far different from that of a perfectly dried, finely-flavored fruit. A free circulation of air, kept dry by a continued fresh supply, would accomplish the work in far less time, and at a much lower temperature; and consequently retain in an incomparably more perfect manner the original characteristics and color of the fruit.

In order to make a beginning in this matter, and to assist in the erection of good, cheap, rapidly-operating, and perfect fruit drying establishments, we present to our readers a figure and description of an apparatus for this purpose, which, although never patented, we believe to be far more valuable than many machines not thus thrown open to the public.—Its peculiar advantages will be obvious as soon as the description is examined.



It consists of a tall, upright shaft, *a b*, represented in the annexed section of the apparatus, through which passes an endless chain, made of a number of strong frames, securely hinged together at their corners. This chain should be strong enough to bear several hundred pounds without breaking. At every joint it is furnished with a braced shelf, each consisting simply of a square frame furnished with coarse twine netting like a sieve. This endless chain with its series of sieves runs over an angular wheel above and another below, precisely like those of a common chain pump, but wide enough to receive the full breadth of the chain. Its motion is quite slow, descending from *a* to *b* on one side, and rising on the other, and is accurately regulated by means of the pendulum *d* connected to the notched wheel *c*, by means of an escapement like that of a common clock, but made very strong. A strong and broad India rubber band connects the axle of this wheel to the drum *c*, on which the chain runs. As the chain is loaded with the drying fruit, and is therefore quite heavy, it must not, and indeed cannot, be subjected to the successive vibrations of the clock-work, these vibrations being broken and destroyed by the India-rubber band.

The whole apparatus being ready for operation, heated air from a stove and drums is made to pass up through the shaft *a b*, being let in at the sides at *b*, and confined to this shaft by the drum *c* being made tight, and fitting closely without touching in its revolutions. A person with freshly cut and pared fruit stations himself at *a*, and as each successive shelf or sieve slowly descends, spreads a single layer over them. They operate like the weight of a clock in keeping up the motion of the pendulum; and the velocity of their descent is regulated by means of the relative sizes of the wheels placed on the axles of *c* and *e*, and also, if necessary, by using different lengths for the pendulum rod.

The great advantage of this contrivance is the following:—"The dry and freshly heated air first enters the bottom of the shaft at *b* and strikes the fruit when the drying process is nearly finished, and completes it; as this air rises, it receives additional portions of moisture from each successive shelf, until finally it passes off at the top,—the driest portion being needed at the bottom, to complete the process, and those most charged with vapor only coming in contact with the freshest fruit at the top, where only it could be useful.

The velocity must be so regulated, by experiment, (according to the height of the shaft, heat of the air, and time required for drying,) that the process shall be just completed by the time the fruit reaches the bottom, where it drops off from the revolving shelves into baskets or boxes placed there for this purpose.

This apparatus may be placed in a tall, narrow building erected for the purpose, and built cheaply by vertical boarding on a wooden frame, to the whole of which a handsome architectural exterior may be imparted by giving it the aspect of a square Italian tower or campanile.

An apparatus of this sort will dry fruit with great rapidity, certainty, and independently of the most unfavorable changes in the weather; and it will come out white, clean, and perfectly dried, retaining all the peculiar flavor of the fresh fruit, and prove incomparably superior to the common half-decayed, smoked, imperfect article. When known, such dried fruit must command almost any price in market.—*Country Gent.*

CUTTINGS OF FRUIT TREES.

Cuttings should be made in autumn after growth has ceased, or early in winter—they may be preserved by fastening them in a box by slats running across, and then placing the open side of the box downwards with its contents in the bottom of a pit dug for the purpose, on a dry spot of ground, and burying the whole with earth. The slats keep the cuttings from coming in contact with the earth below, and they are preserved in a proper moist condition. Or, they may be packed in slightly damp moss, in a large box, placed in a cellar. Very early in spring they should be set out. Every cutting should be cut off just above a bud at the upper end, and just below one at the lower end. Taken off closely to the old wood, with the base notched, they are more sure of growth. They should be set out in a trench, in a rich mellow soil, which is to be packed or trodden closely about them as the trench is filled, and afterwards a mellow surface made by drawing on a little more earth. The length of the cutting should be eight inches to a foot, and two-thirds to nine-tenths buried. Shading the cuttings of any deciduous trees, (including all fruit trees) is of little or no advantage, but it is important to keep the ground uniformly moist; if this is done by watering, the surface should be preserved from crusting or cracking by mulch.—This is the mode of raising quince trees, currant and gooseberry bushes, grapes, &c., but will not answer for the larger fruits generally, in the Northern States—it is cheaper to buy of graft, than to procure the few which may be obtained among many failures in this way.—*Albany Cultivator.*

WINTERING CABBAGE PLANTS.

Any method, simple and inexpensive, for preserving of autumn sown cabbage plants through the winter, is a valuable consideration. We know of none better adapted for the great bulk of people, than the following, practiced to a considerable extent by market gardeners, and in dry, sandy or upland soil, with good success.

Towards the end of October, prepare some rich well-dug ground; draw some deep drills eighteen inches apart, and plant the cabbage one foot apart in these, on the sunny side of the drills, so that the plants may have all the benefit of the sun in the fall before severe frost, and in early spring. When the frost sets in fairly, place some straw, or other light material crossways of the rows, which will effectually keep the sun's rays off during winter, which is the great point to be attended to.—At the approach of spring, remove the covering, and as the plants grow, draw a little of the soil to their stems.

If they stand the winter well, they will be in advance of those planted in the spring. The strongest of the plants from the sowing made last month, should be selected, while those weaker will do to winter as recommended in a previous paper.—R. S., *in Country Gent.*

Apple trees may be transplanted with success. Bank them up well with earth to support them through the winter; in the spring it must be removed.

Carrots and beets must be gathered before heavy frosts—turnips may remain later.

Strawberry beds should be mulched, and tender raspberries laid down and protected.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending Oct. 17, 1854.

E. B. Bigelow, Boston, Mass., improved loom for weaving cut pile fabrics. Patented in England Dec. 31, 1851.

J. T. Bowes, Manyunk, Pa., improved power loom.

Daniel Barnum, N. Y., City machinery for trimming hat bodies.

J. D. Elliot, Leicester, Mass., new form of Water Meter.

E. A. Hill, Joliett, Ill., Smoke Consuming Stove.

W. D. Hartuo, Petersburgh, Ind., Shoemakers' Edge Planes.

E. J. La Mothe, New York City, improved Iron Buildings.

John H. Manny, Freeport, Ill., ante-date June 15, 1854, Grain and Grass Harvesters.

Charles Ross, Rochester, N. Y., Improved Grinding surface in Mill Stones.

Moses Sargent, Meriden, N. H., Improved Roving Tube in Cotton Machinery.

John J. Squire, St. Louis, Mo., Improved Sawing Machine.

R. B. Stevenson, York, Ohio, Improved Water Pipe.

C. F. Thomin and Chas. Stumer, Cincinnati, O., new mode of Enameling Iron.

Henry Wayne, Cincinnati, O., Joint for Toilet Glass.

R. D. Williams, Wilmington, Del., and T. Tyrrell, York, Pa., Improved Brick Press.

John Yandell and Jos. H. Johnson, St. Louis, Mo., improvement in Iron Bridges.

J. H. Stimpson, Baltimore, Md., (Executor of Jas. Stimpson, deceased,) ante-dated April 17, 1854, Vessels for Holding Liquids.

John Richardson, N. Y. City, New Pen and Pencil Case.

Re-Issues.

John Hollingsworth, Zanesville, O., Improved Smut Machines.

Do., Machinery for Polishing Raw Hide Whips.

FUR AND SILK HATS.

Two years ago we spoke in hopeful terms of what then seemed to be a favorable movement in changing the fashion, from wearing silk to that of wearing felt or fur hats. But the silk hat, with all its rigid and air-tight qualities has again assumed such a sway that it is difficult to obtain a good black fur hat in this city.

Of this we have been assured by a person who cannot wear a silk hat, and who dislikes to wear a felt one. Silk hats are generally made perfectly air-tight, and without an opening in any part of them, they cannot be otherwise. The body of a silk hat is saturated with shellac varnish, on which a silk plush covering is laid, and secured by steam and pressure, thus forming a perfectly air-tight head covering. Now, as the head of man perspires as freely as the other parts of his body, it is necessary for health that the perspiration should escape freely. When prevented from doing so it is the cause of frequent headaches to many persons, and it is affirmed that it tends to cause early baldness, by the action of the carbonic acid and steam of perspiration upon the hair—a counterpart of the sweating process employed in some tanneries for loosening the hair of hides. It cannot but be unfavorable to health when perspiration is not suffered freely to escape from the head, for if the whole body of any person were encased in a perfectly air-tight covering, existence could not be maintained but for a very short period. There are cases on record of death having resulted in a very short space of time from covering the body with an air-tight envelop. We cannot therefore but speak in the strongest terms against the use of air-tight silk hats, and per contra in favor of such kind of hats—like felt and fur—as allow of free head ventilation.—If the public persist in wearing silk hats, let them all be properly ventilated, (as some are now made) so that they may also fulfil the purpose of health as well as head roofing.—*Scientific American.*

Wood Gas.—We heretofore mentioned the fact that Dr. Wm. P. M'Connell, of this city, has obtained a patent for making gas from wood, by a safe, simple, economical, and cleanly process. His prior right to the discovery was contested by two distinguished German chemists, who had patented the identical invention two years ago; but the commissioner, in view of the facts in the case, decided in favor of our ingenious fellow-citizen, who is now prepared to issue illuminating dispensations.—The apparatus occupies but a small space; and any one with only wit enough to put a stick of wood into the cylinder can manage the gas making. It will indeed be valuable upon shipboard, and in rural neighborhoods. Every man can now be independent of the gas companies.—*Washington Sentinel.*

The Mint Sweeps.—The officers of the Mint of Philadelphia have issued a card to the following effect:

Sealed proposals will be received at the Mint of the United States until three o'clock on the 15th of January next—when they will be opened by the Director of the Mint, in the presence of such of the bidders as may be present—for the purchase of one hundred and forty-five barrels of Mint sweeps, containing gold and silver. They will be sold in lots—thirteen of ten barrels each, and one of fifteen barrels—to the highest bidder. Should, however, the bids unexpectedly fall greatly below the true value of the sweeps, as reported by the Mint assay, the Director reserves the power of rejecting the whole of said bids.

Securing and Setting Harrow Teeth.—E L. Hagar, of Frankfort, N. Y., has applied for a patent for an improved method of constructing harrows, by which the teeth can be easily adjusted, and set vertically, obliquely, and at any depth desired. The objects attained by this improvement are of no small importance to our agriculturists.—*Sci. Am.*

IMPROVEMENT IN QUILTING FRAMES.

And why not improve quilting frames?—They need it. The old ones are about as awkward contrivances as ever were conceived, always in the way when in use, with their long arms sticking out all over the room, long after they have ceased to be useful. What man ever looked upon these necessary implements of household economy with any satisfaction?—He looks every time he comes into the house with an anxious eye at the rack, "hoping the confounded long-armed quilting-frames will get out of the way some time." Now for the especial benefit of such necrous gentlemen, some good soul out in Michigan has invented a quilting machine that has no arms to stick out in the way. "Necessity is the mother of invention," and this inventor, we suppose, lived in a log cabin only 16 feet square, which, as it contained two beds and a cooking-stove, and no spare room to set up the quilting-frames on four chairs, so he contrived a machine something like this as near as we can understand the description:—Frame four legs together like the frame of a kitchen table, with side-pieces 9 feet long, dropped 5 inches below the top of the legs, and end-pieces 2½ feet long.—Now take some scantling 2 or 2½ inches square, and round them with inch tenons upon each end, to work in sockets in the top of the legs. Upon one end of each of these rollers have a little ratchet wheel and catch and nail a strip of cloth along on one side of each, to which to tack the edges of the quilt. When all ready, roll it all but the 2½ feet wide strip upon one roller and tighten the catch; now quilt that and roll upon the other roller and so on till finished.

The side-pieces should be made to go in with a key, so that the frame can be taken down and packed away at any time even with the quilt half finished, as it can be rolled up snug. It is a simple piece of domestic machinery, but would add to the comfort of many a household.

Domestic Economy.

Composition for rendering Boots and Shoes Water-Proof.—Take one pint of boiled *linseed oil*, 2 *oz. of bees wax*, 2 *oz. spirits of turpentine*, and 2 *oz of Burgundy pitch*. Let them be carefully melted over a slow fire. With this mixture new shoes and boots are to be rubbed in the sun, or at a little distance from the fire, with a sponge or brush. This operation should be repeated without wearing them as often as they become dry, until they are fully saturated; which will require four or five times brushing. By this, the leather becomes impervious to water. The boot or shoe, thus prepared, lasts much longer than common leather; it acquires such pliability and softness, that it will never shrivel, nor grow hard, and in that state, is the most effectual preventive against colds, &c. It is necessary to remark that shoes and boots thus prepared, ought to be worn until they become perfectly dry and elastic; as in the contrary case, the leather will become too soft, and wear out much sooner than it otherwise would.

A Rice Plum Pudding.—Take three gills of whole rice; wash it, and boil it in a pint of milk. When it is soft mix in a quarter of a pound of butter, and set it aside to cool; and when it is cold, stir it into another pint of milk. Prepare a pound and a half of raisins or currants; if currants, wash and dry them; if raisins, seed them and cut them in halves.—Dredge them well with flour, to prevent their sinking; and prepare also a powdered nutmeg; a table-spoonful of mixed mace and cinnamon powdered; a wine glass of rose water; and a wine glass of brandy or white wine. Beat six eggs very light, and stir them into the mixture, alternately with a quarter of a pound of sugar. Then add by degrees the spice and the liquor, and lastly, stir in, a few at a time, the raisins or currants. Put the pudding into a buttered dish and bake it an hour and a half. Send it to table cool.

You may make this pudding of ground rice, using but half a pint instead of three gills.

Indian Light Biscuit.—A quart of Indian meal; a pint of sifted wheat flour; a very small tea-spoonful of salt; three pints of milk; four eggs.

Sift the Indian and wheat meal into a pan, and add the salt. Mix them well. Beat the whites and yolks of the eggs separately. The yolks must be beaten until very thick and smooth; the whites to a stiff froth that will stand alone of itself. Then stir the yolks gradually, (a little at a time) into the milk.—Add by degrees the meal. Lastly, stir in the beaten white of egg, and give the whole a long and hard stirring. Butter a sufficient number of cups, or small, deep tins—nearly fill them with the batter. Set them immediately into a hot oven, and bake them fast. Turn them out of the cups. Send them warm to table, pull them open, and eat them with butter.

They will puff up finely, if at the last, you stir in a level tea-spoonful of soda, melted in a little warm water.

Mince Pies.—Boil three pounds of lean beef till tender, and when cold chop it fine.—Chop three pounds of clear beef suet, and mix the meat, sprinkling in a table-spoonful of salt. Pare, core and chop fine six pounds of good apples; stone four pounds of raisins and chop them; wash and dry two pounds of currants; and mix them all with the meat. Season with a spoonful of powdered cinnamon, a powdered nutmeg, a little mace, and a few cloves, pounded, and one pound of brown sugar; add a quart of Madeira wine and a half pound of citron cut into small bits. This mixture put down in a jar and closely covered will keep several weeks. It makes a rich pie for Thanksgiving and Christmas.—*Maine Farmer.*

Small faults indulged, are little thieves that let in greater.

Educational.

COUNTRY SCHOOLS.

The tendency of population to centralize is peculiarly manifested in the falling off of the number of scholars in our Country Schools.—The city is fast absorbing the business of surrounding villages, and drawing off their mechanics and traders, as well as young men not yet established in regular employments.—Nearly every village in the vicinity of our Western cities, is either stationary or actually receding in the number of its population; while in the country around these results are, if possible, much more apparent.

In rural neighborhoods, where twenty years ago large numbers of scholars, from the tiny boy of five years, up to the full-grown proportions of six foot manhood, were wont to collect together in the winter school, and give employment, both mentally and physically, to young pedagogicians, dressed for a brief space with the authority of pedagogues, there can now be found scarcely a sufficient number of scholars to employ a female teacher. Many of the old school-houses, that in former years stood by the wayside, have disappeared, and their places remain unsupplied. The glory of the birch and ferule has departed, and the "boarding round" method of housing and feeding the school-master, is an obsolete idea.—The facilities for acquiring an education are not diminished it is true; but they are concentrated on fewer points and district limits made to extend over a wider range of territory.

Fewer teachers are perhaps employed proportionately to the number of scholars, but their qualifications are superior, and the profession much more exalted as well as better paid. It is perhaps safe to say that a score of years ago, not one in fifty of the Common School Teachers ever saw an Algebra or Geometry, and many of them were deficient even in Arithmetic. Now, although it is not absolutely required, there are very few teachers, even of the humblest schools, but have studied at least the rudiments of the higher mathematics, and are conversant with popular treatises on Natural Philosophy, Chemistry, and other kindred sciences. The glories, however, of the old country school-house are numbered among the things that were; the big sled that was wont to hold a dozen of the largest boys and girls on a headlong coast down the steep hill, is broken; the tall old forest trees, behind whose mossy trunks the scholars were accustomed to play "I spy," have disappeared; the evening schools and exhibitions have gone to the shades, and the juvenile throngs that attended them have become staid men and women—heads of families, whose children now attend a Union School, in the midst of the village, or a public one in the dense and crowded limits of some busy city.

[For Moore's Rural New-Yorker.]

TONES IN READING, BAD HABITS, &C.

Familiarity with any thing, creates inattention, perhaps insensibility, to its peculiarities. Hence it is that teachers who are by no means neglectful of their duty, often allow their young pupils to acquire unnatural tones, and to form disagreeable habits in reading, almost without being aware of it. Take the child who is called to read for the first time; when the letters are named to him, he will doubtless repeat them in a natural tone; but let the operation be continued, and he will be found to slide imperceptibly into an artificial tone.—This will be especially the case if he is a little wanting in energy, or rather slow at learning. The change is gradual, and the teacher, unless on the watch, does not perceive it until the habit is nearly formed; and if not seasonably corrected, it soon becomes so established, that the most careful future training is hardly sufficient to set things right again.

But suppose the thing is discovered in time, and an effort is made to correct it. The effort may be successful, but very soon the little urchin will be found to be "running off the track" in another direction. (I speak from experience.) Thus it is seen, that one of the greatest tasks of the teacher, is *to prevent*.—A little want of energy in the pupil, a little hesitancy, will require the teacher's constant care, if he wishes to train aright. It may here be observed that those children that are slow to learn, slow of speech, or inclined to be stupid, are much more disposed to run into bad habits of reading, than those of an opposite character, and hence require greater watchfulness, and more constant care in training.

But suppose the teacher himself to be not very quick to discover, or not to feel much interest in the matter; and after a few feeble attempts, (or none at all,) to prevent or correct the evil, abandons the object—how soon is the mischief done, the habit formed, almost beyond the hope of correction.

"Reading differs from talking." True it *does*, and here we have the principal reason for it. It does with some, whatever be the subject, and hence it is that we have so few good readers among us. But let teachers themselves know what good reading is, and let them both teach and practice it, in training the young, and we should soon discover wherein the true difference lies, and be able to observe it in our reading. Good reading is an accomplishment of so much importance, that every one who offers himself as a teacher, should strive for its attainment; and facilities for becoming good readers are so numerous, that no teacher can be excusable, who neglects them.—Good reading as an entertainment, is second only to good singing. H.

Oak Weat, Ore., 1853.

OUTLINE MAPS.

Geography has become an important study in our public schools. The rapidly increasing facilities for commerce and trade, the opportunities for reciprocal intercourse and communication between the United States and other nations, render a good knowledge of geography highly important, if not indispensably necessary to every American citizen.

The ancients learned geography by visiting different countries, and studying the topography of every place, and the physical and political condition of each state or division.—This course is desirable now, as far as circumstances will permit, for the impressions made upon the mind by actual observation are more satisfactory than those otherwise received.—Next to actual observation, there is no better means of acquiring a part of this information than by the help of a good map, and for school instruction, none so well as a well-executed outline map. By means of outline maps, a whole class or school can be taught the form and situation of different positions of the earth's surface; at the same time one individual could learn the same. The great outlines of the continents, with their bays, gulfs, inlets, and all their sinuosities; the mountain ranges and water courses; the natural features of sea and land, and the political divisions, with their proportionate size and geographical position, can thus be taught successfully at a great saving of time both to teacher and pupil.

In a series of visits made last spring to a large number of schools in New England and New York, I saw no exercises more interesting than those in geography, conducted without any books. In some instances a large class was taken into a large hall or recitation room, containing blackboards, outline maps and a globe. No book was used, no question asked from a book, and yet the recitation exhibited a very thorough study of physical, statistical and civil geography. The pupils were questioned by others, and questioned each other in every department; the maps seemed like household pictures, every line of which was familiar; the globe was like a toy, a plaything, and a few touches of the crayon on the blackboard brought out countries, mountains, seas and rivers as if by magic.

Some teachers can make outline maps themselves; indeed, every teacher should prepare outlines of their district, town, &c. The drawing of outline maps upon the blackboard was pursued with very great success at the Bridgewater Normal School, while Mr. Tillinghast was principal, and perhaps is now. It might be done in every school to some extent. But we should say to every teacher, make or get a good set of outline maps, and a globe; with these use some good physical or universal geography, for reference, and then with the ordinary school geographies, a good foundation may be laid in a study, which from its nature must be ever progressive; and which is necessary not only on account of its relations to practical business in life, but also in its connection with most of the natural sciences.—C. in *N. Y. Teacher*.

EDUCATION IN THE UNITED STATES.

That which is elsewhere left to chance, or to charity, we secure by law. For the purpose of public instruction, we hold every man subject to taxation of his property, and we look not to the question whether he himself have or have not children to be benefitted by the education for which he pays.

We regard it as a wise and liberal system of policy, by which property and life, and the peace of society, are secured. We seek to prevent, in some measure, the extension of the penal code, by inspiring a salutary and conservative principal of virtue and of knowledge at an early age.

We hope to excite a feeling of responsibility, and a sense of character, by enlarging the capacity and increasing the sphere of intellectual enjoyment. By general instruction, we seek, as far as possible to purify the moral atmosphere, to keep good sentiments uppermost, and to turn the strong current of feeling and opinion, as well as the censures of the law and the denunciation of religion, against immorality and crime. We hope for a security, beyond the law, and above the law, in the prevalence of enlightened and well principled moral sentiment.

Education, to accomplish the ends of good government, should be universally diffused.—Open the doors of the school-house to all the children of the land. Let no man have the excuse of poverty, for not educating his own offspring. Place the means of education within his reach, and if they remain in ignorance, be it his own reproach.

If one object of the expenditure of your revenue be protection against crime, you could not devise a better or cheaper means of obtaining it. Other nations spend their money in providing means for its detection and punishment, but it is for the principles of our government to provide for its never occurring.—The one acts by *coercion*, the other by *prevention*. On the diffusion of education among the people, rests the preservation and protection of free institutions.—*Webster*.

A mind that is conscious of its integrity scorns to say more than it means to perform.

PORTRAIT OF SIR JOHN FRANKLIN.

SIR JOHN FRANKLIN AND HIS COMRADES.

The recent letter from Dr. Ray, dated at York Factories, on Hudson's Bay, Aug. 4th, to Sir George Simpson, Governor of the Hudson's Bay territory, throwing light upon the fate of the illustrious navigator, Sir John Franklin and his companions, is exciting a great deal of interest through the community. Dr. Ray was in command of a party which went in search of the missing expedition, and wintered last season at Repulse Bay, in the Arctic regions. On the 31st of March last he again took up his line of march to the North West, and on the 17th of April fell in with a party of Esquimaux, "from whom I learned," says Dr. Ray, "that in the spring, four winters past (spring of 1850,) a party of white men, amounting to about forty, were seen traveling southward over the ice, and dragging a boat with them, by some Esquimaux who were killing seals on the north shore of King William's Land, which is a large island named Kel-lk-tak, by the Esquimaux. None of the party could speak the native language intelligibly, but, by signs, the natives were made to understand that their ships or ship had been crushed by ice, and that the "whites" were now going to where they expected to find deer to shoot.—From the appearance of the men, all of whom except one officer (chief,) looked thin, they were then supposed to be getting short of provisions, and they purchased a small seal from the natives.

"At a later date, the same season, but previous to the disruption of the ice, the bodies of about thirty white persons were discovered on the continent, and five on an island near it, about a long day's journey (say 35 or 40 miles) to the N. W. of a large stream, which can be no other than Back's Great Fish River, (named by the Esquimaux Ouk-koo-hi-ca-lik) as its description, and that of the low shore in the neighborhood of Point Ogle and Montreal Island, agree exactly with that of Sir George Back. Some of the bodies had been buried, (probably those of the first victims of the famine,) some were in a tent, or tents others under a boat that had been turned over to form a shelter, and several lay scattered about in different directions. Of those found on the island, one was supposed to have been an officer, as he had a telescope strapped over his shoulder and his double-barrelled gun lay underneath him.

"From the mutilated state of many of the corpses, and the contents of the kettles, it is evident that our miserable countrymen had been driven to the last resource—cannibalism—as a means of prolonging life. There appears to have been an abundant stock of ammunition, as the powder was emptied in a heap on the ground by the natives, out of the keg, or cases containing it, and a quantity of ball and shot was found below high water mark, having been left on the ice close to the beach. There must have been a number of watches, telescopes, compasses, guns, (several double barrelled) &c., all of which appear to have been broken up, as I saw pieces of these different articles with the Esquimaux, and together with some silver spoons and forks, purchased as many as I could obtain."

Sir John Franklin was born at Spilsby, in Lincolnshire, near the North Sea, in 1786, and would accordingly have been 68 years of age had he survived to the present time. He early manifested a predilection for the sea, and was ever characterized by a fearless and adventurous spirit. He entered the British naval service on a Midshipman's warrant in the 14th year of his age; was in the battle of Copenhagen, in 1801, and two years after accompanied his relative, Captain Flinders, on a voyage of discovery to the South Sea, during which he was shipwrecked on the coast of New Holland. At a subsequent period, he was in the Belerophon at the battle of Trafalgar. In 1814 he was a lieutenant in the Bedford, which brought the allied monarchs to England. He was concerned in the attack on New Orleans, where he gained great credit by his bravery and skill.—In 1818 he commanded the brig Trent in the Polar Expedition under Captain Buchan.

In 1819 he commanded a land expedition from Hudson's Bay to the mouth of the Coppermine, and after incredible hardships, having been once rescued from death by the Indians, he returned to England in 1822. He was promoted to the rank of Post Captain, and three years after undertook a second expedition to the same inhospitable shores, penetrating as far as the 17th degree of latitude and the 150th of West Longitude. He was knighted by George the Fourth in 1830, and was subsequently appointed Governor of Van Deiman's Land, whence he was recalled in 1845 to be sent upon the expedition from which he was fated never to return.

Sir John was twice married, first in 1823 to Eleanor Ann, daughter of Mr. Porden, an eminent artist; and secondly in 1828, after his first wife's decease, to Jane, second daughter of John Griffith, Esq., of Bedford Place, London. Both were women of pre-eminent talent and virtues, and the self-sacrificing and heroic spirit of the latter in behalf of her lost husband and his ill-fated companions, has touched a sympathetic chord in every human bosom.

SLAVING FOR MONEY.

We pity the man who wears out his energies in the accumulation of riches, which, when amassed, he will have lost the capacity to enjoy. He finds himself at the end of his labors, a guest at his own feast, without an appetite for its dainties. The wine of life is wasted, and nothing remains but the lees. The warm sympathies of his heart have been choked by the inexorable spirit of avarice, and they cannot be resuscitated. The fountain head of his enthusiasm is sealed; he looks at all things in nature and in art with the eye of calculation; hard-matter-of-fact is the only pabulum his mind can feed on; the elastic spring of impulse—the poetry of existence is gone.

Are wealth and position an equivalent for these losses? Is not the millionnaire, who has acquired wealth at such a cost, a miserable bankrupt? In our opinion there is little to choose, on the score of wisdom, between the individual who recklessly squanders his money as he goes along, in folly and extravagance, and the false economist who denies himself the wholesome enjoyments of life, in order to swell the treasure, which, in the hardening process of scraping up, he has become too mean to spend, and too selfish to give away.

The only rational way to live, is to mix labor with enjoyment—a streak of fat and a streak of lean. There is nothing like a streaky life—a pleasant mixture of exertion, thankfulness, love, jollity, and repose. The man who stares for riches, makes a poor return to that God who took the trouble of making him for a better purpose.—*Montgomery Ledger*.

Making Promises.—Always think before you make an assertion. Be sure that it is correct before you utter it, and that you will not be compelled to retract it after it has once passed your lips. Invariably make it certain before you give a promise that it can be fulfilled. We speak to impulsive, well-meaning men, (there are many of them,) who are too much in the habit of letting their wishes prompt their utterance, and who, in obedience to their *desire* to do more than they can, say lustily that they will do it, and afterwards, to their great distress and mortification, find that they are placed in that most humiliating of all positions—a falsifier of their word. These men are not morally liars—for a lie is constituted of something which the speaker knows is not true when he says it—but they get the character for being such and as such are despised and scorned. One cannot be too cautious in making business or other promises.—Don't say you will because you think you can—be positive you can first.

Pleasure in general, is the apprehension of a suitable object, suitably applied to a rightly disposed faculty; and as must be conversant both about the faculties of the body and of the soul respectively.

Sunday Reading.

BEYOND THE RIVER.

The following beautiful lines, from the Dublin University Magazine, will remind the reader of the last scene in Bunyan's "Pilgrim's Progress":

Time is a river deep and wide;
And while along its banks we stray,
We see our loved ones o'er its tide
Sail from our sight away, away.
Where are they sped—they who return
No more to glad our longing eyes?
They've passed from life's contracted bourne
To land unseen, unknown, that lies
Beyond the river.

'Tis hid from view; but we may guess
How beautiful that realm must be!
For gleamings of its loveliness,
In visions granted, oft we see.
The very clouds that o'er it throw
Their veil, unrobed for mortal sight,
With gold and purple tintings glow,
Reflected from the glorious light
Beyond the river.

And gentle airs, so sweet, so calm,
Steal sometimes from that viewless sphere;
The mourner feels their breath of balm,
And soothed sorrow dries the tear!
And soon times list'ning ear may gain
Entrancing sound that bliss beats;
The echo of a distant strain,
Of harps' and voices' blended notes,
Beyond the river.

There are our loved ones in their rest;
They've cross'd Time's River—now no more
They heed the bubbles on its breast,
Nor feel the storms that sweep its shore.
But *there* pure love can live, can last—
They look for us their home to share:
When we in turn away have pass'd,
What joyful greetings wait us *there*,
Beyond the river.

REST OF THE SABBATH.

The North British Review speaks of the physical necessity of the Sabbath, as follows:

The Creator has given us a natural restorative—sleep; and a moral restorative—Sabbath-keeping; and it is ruin to dispense with either. Under the pressure of high excitement, individuals have passed weeks together with little sleep, at once; but when the process is long continued, the over-driven powers rebel, and fever, delirium and death come on. Nor can the natural amount be systematically curtailed without corresponding mischief. The Sabbath does not arrive like sleep. The day of rest does not steal over us like the hour of slumber. It does not entrance us almost whether we will or not; but, addressing us as intelligent beings, our Creator assures us that we need it and bids us notice its return, and count its recurrence. And if, going in the face of the Creator's kindness, we force ourselves to work all days alike, it is not long till we pay the forfeit. The mental worker—the man of business, or the man of letters, finds his ideas becoming turbid and slow; the equipoise of his faculties is upset; he grows moody, tiful, and capricious; and with his mental elasticity broken, should any disaster occur, he subsides into habitual melancholy, or self-destruction speeds his guilty exit from a gloomy world. And the manual worker—the artizan, the engineer, by toiling on from day to day, and week to week, the bright intuition of his eyes gets blunted; and, forgetful of their cunning, his fingers no longer perform their feats of twinkling agility, nor by a plastic touch mould dead matter, or wield mechanic power; but mingling his life's blood in his daily drudgery, his looks are prematurely gray, his general humor sours; and during it till he has become a morose or reckless man, for an extra effort, or any blink of balmy feelings, he must stand indebted to opium or alcohol.

Cost of Public Worship.—It is estimated that the current expenses of the churches of Boston will amount to $240,000 a year. The value of the church estates is about $4,000,000. The expenses of the different societies vary from $1,500 to $5,500 a year. The cost of public worship in the churches occupied by the wealthier portion of the citizens will average about $100 a Sunday. The clergyman has a salary of $3,000, the music costs about $1,000, and the miscellaneous expenses will be from $1,000 to $1,500 a year. The taxes on the pews vary from $8 to $70 a year, according to their value. The Methodist preachers have the smallest average salaries and the Unitarians the largest. The Protestant sects have ample pew accommodations for their worshippers, but the Catholics greatly need a large edifice at the West End. They are now erecting spacious churches in the South Cove and at the south part of Tremont st. North of the line of State, Court and Cambridge-sts. the Catholics have not more than half room enough for the members of their faith. About twenty sects have places of worship in this city, and the figures given above will show that no compulsion is needed to insure a liberal support for public worship from the community.—*Boston Transcript*.

The Crooked.—Have you noticed that tree in the corner of the yard? When very young it was bent down to the earth and embedded there. It then shot up again, but now it is forever deformed. The sun may shine, the dew and rain may fall, but the tree will never be straight. So, bad habits, once fixed, are hard things to root out.

Sophistry may perplex truth, ingenuity may warp the decrees of justice, and ridicule may raise an undeserved laugh; but where free inquiry prevails, errors will be corrected, justice will be revered, and ridicule will be retorted on those who have abused its influence.

Those who feel most deeply, are most given to disguise their feelings, and derision is never so agonizing as when it pounces on the wanderings of misguided sensibility.

Miscellaneous.

[Written for the Rural New-Yorker.]

THE BLACKSMITH.

PORTRAITS OF DISTINGUISHED INDIVIDUALS.—No. 1.

Of a mighty man is the blacksmith,
With his sinewy arm and strong;
And as the world have learned him aright,
We will not write him wrong.

He'd blow and strike, and hammer and pound,
Though a man of peace is he;
He's often given to *forging*,
But never to *forgery*.

He'll screw and twist, and wrench and turn,
Though honest to his dealing;
And while he often *takes the steel*,
He never *takes to stealing*.

His *stock* is seldom less than par,
And often takes a rise;
No matter what his *virtues* are,
He's much to do, with *vice*.

His temper it is always good,
Though *hard things* form his lot;
He's often to a "melting mood,"
And strikes while the iron's hot.

He sometimes sways no *iron rod*,
Although a foe to *tyranny*;
His *figures* are not those of speech,
Though oft he uses *irony*.

And ere his great work is complete,
And he shall close his books,
Our swords he'll into plowshares beat,
Our spears to pruning-hooks. H. ROBERTS.

THE TWO NEIGHBORS.

JOHN SMITH and WILLIAM FITZROY are neighbors in proximity, but in no other respect. The former lives just around the street corner from the latter, but then it is a street inhabited by mechanics and workingmen. The houses are small, the street unpaved, and there are no gas lights after you pass around the corner. FITZROY'S street is graded and paved, gas lanterns are placed at intervals, and the houses have a sort of aristocratic look. They are furnished with door plates and bell pulls, ornamented verandahs, and porticos, sometimes proportioned and sometimes disproportioned to the houses to which they belong. The young FITZROYS go to a private and select academy, while the junior SMITHS mingle with four or five hundred other children at the public school. The FITZROYS are fashionable people, the SMITHS unfashionable; the former dress finely, do little, give parties and attend them, and turn up their noses at the SMITHS, who are the opposite in all these things.

But there are some other points of difference worth mentioning. The SMITHS own the house they live in, even though it is a small one; the FITZROYS rent theirs of a landlord who has more than once threatened to eject them for arrears. The SMITHS owe no man anything, pay the butcher and the market man every week, would be trusted if it became necessary for any reasonable amount, and have several hundred dollars in the Savings Bank. The FITZROYS owe more than the butcher and market-man's accounts, only pay when they can get trusted no longer, and never had a Savings Bank book in their lives.

The senior SMITHS are sober, industrious, pains-taking, and thriving people, earning more than they spend, and laying aside a small surplus yearly, while the SMITHS, jr., are studious excellent scholars, and bid fair to become honorable and useful citizens. The senior FITZROYS live in fashionable and expensive idleness, making great pretensions, but are really despised by all right thinking people. The FITZROYS, jr., are lazy, turbulent, and quarrelsome; miserable scholars and supercilious pharisees; holding the SMITHS in supreme contempt, while at the same time they are as much inferior to them in everything that makes a boy give promise of a reputable manhood, as the spark of the glow worm is inferior to the full glory of the morning star.

WEARING THE BEARD.

No one can mistake the silent but sure revolution that is going on in the community with reference to wearing the beard. A few years since the full sized beard and moustache were only seen upon the face of some fanatic or eccentric genius, who was willing to brave public opinion for the sake of his religious scruples, or for the purpose of showing his contempt for the ordinary customs of society. Subsequently the innovation was extended by traveling foreigners, and by home bred fops, who are ever ready to ape the fashions and follies of the old world.

Count SUCKOZINSKO (vulgarly pronounced Suck-us-in-so) sports a moustache at Saratoga; and forthwith young FIZZLE, whose father keeps a fashionable shop on Broadway, commences the raising of a downy covering to his upper lip, by a plentiful application of bear's grease and Macassar. General SWACKHAMER appears in public on this side of the Atlantic like a "whiskered Pandour," and whiskers thereupon become the rage among the fondies of the warlike foreigner. Sober men, persons of sense and standing in society, for the very purpose of appearing the antipodes of these, shave, of course.

Common sense teaches us, however, that the beard was intended to be worn; that properly cultivated and trained, it is both useful and ornamental, and that long familiarity with a close shaven face is necessary to render such an unnatural object at all pleasing. Would any man of sense, desirous of impressing people favorably as to his personal appearance, adopt the shaven crown of the Friar, the scalp-lock of the Indian, or the pig-tail of the Chinese? And yet, either is just as naturally pleasing as a close shaven face.

There is now and then to be seen a young lady, or a female calling herself such, who, being ambitious to appear intellectual, or to exhibit a greater amount of forehead than was designed her by the Creator, and laboring under the mistaken idea that because a moderately sized and well proportioned front is handsome, a bigger one must of necessity be handsomer, thereupon applies the tweezers to her ambrosial locks; and in place of the natural covering of the forehead there straightway appears a livid looking streak, which, in spite of all efforts to conceal it, displays to disgusting lines the folly and contemptible shallowness of the individual. Why is shaving of a man's face regarded with any more favor than denuding of a woman's forehead? Simply because it has been practiced more generally and for a longer time, rather than from any intrinsic difference in the acts.

A great reform is going on in the matter of wearing beards; and they now appear in untrimmed luxuriance upon the faces of men who stand at the remotest possible distance from the character of fops. In all ranks of life, and in every grade of employment, the razor is in a measure eschewed, and men are returning to reason. Moustaches, even, are now as common as a few years ago they were rare. The chills of the coming winter will be as potent in starting beards as they will be powerful in blasting vegetation. Razors, colds, and bronchitis will be laid aside together, and a flowing beard supercede the use of an indefinite list of patent medicines.

ENGLISH HIGHWAYMEN.

ONLY three summers since, a French gentleman traveling in Scotland, was gazing with some surprise at the tranquil and orderly scenes around him, and saying that his friends in Paris had advised him to come upon his journey well provided with pistol and sword, since, as they bid him bear in mind, "you are going to the country of Rob Roy!" We can scarce blame these Parisians for so faithfully remembering that little more than a hundred years ago Rob Roy was able to levy his "black mail" on all who came beneath the shadow of his mountains. But they might with equal reason have applied the same advice to England; for much less than a hundred years ago the great thoroughfares near London, and, above all, the open heaths, as Bagshot and Hounslow, were infested by robbers on horseback, who bore the name of highwaymen.—Booty these men were determined by some means or other to obtain. In the reign of George the First they stuck up handbills at the gates of many known rich men in London, forbidding any of them on pain of death, to travel from town without a watch, or with less than ten guineas of money. Private carriages and public conveyances were alike the objects of attack.

Thus, for instance, 1765, Mr. Nuttal, the solicitor and friend of Lord Chatham, returning from Bath in his carriage with his wife and child, was stopped and fired at near Hounslow, and died of the fright. In the same year, the guard of the Norwich stage (a man of different metal from the lawyer) was killed in Epping Forest, after he had himself shot dead three highwaymen out of the seven that assailed him. Let us not suppose that such examples were few and far between: they might from the records of that time, be numbered by the score; although in most cases the loss was rather of property than life. These outrages appear to have increased in frequency towards the close of the American war. Horace Walpole, writing from Strawberry Hill, at that time, complains that, having lived there in quiet for thirty years, he cannot stir a mile from his own house, after sunset, without one one or two servants armed with blunderbusses. Some men of rank at that period—Earl Berkly above all—were famed for their skill and courage in dealing with such assailants. One day—so runs the story—Lord Berkley, traveling after dark on the Hounslow Heath, was awakened from a slumber by a strange face at his carriage window, and a loaded pistol at his breast. "I have you now, my lord," said the intruder, "after all your boasts, as I hear, that you would never let yourself be robbed!" "Nor would I now," said Lord Berkley, putting his hand into his pocket, as though to draw forth his purse, "but for that fellow peeping over your shoulder."—The highwayman hastily turned round to look at this unexpected intruder, when the Earl, pulling out instead of a purse a pistol, shot him dead upon the spot.—*Lord Mahan's History of England.*

SIX things are requisite, says Hamilton, to create a happy home. Integrity must be the architect, and tidiness the upholsterer. It must be warmed by affection, and industry must be the ventilator, renewing the atmosphere and bringing fresh salubrity day by day; while over all, is a protecting canopy and glory, nothing will suffice except the blessings of God.

HAPPINESS is promised not to the learned but to the good.

Ladies' Department.

THE SPIRIT'S WHISPER.

BY KATE WOODLAND.

Brightly falls the golden sunbeam on this glad October morn,
Lightly sways the whispering zephyr cool amid the standing corn,
Sweetly smiles the Autumn blossom from behind its dew-bright tear,
And from out the grove and orchard parting strains of Joy I hear;
Far across the fertile valley, up amid the ether dim,
Nature wears a smile of gladness, while she chants her morning hymn.

'Tis a glorious happy morning, and my spirit looketh forth,
From the windows of its chamber, o'er the glad rejoicing earth.
Gazeth on the fields all shaven of their wealth of golden grain,
On the treasures yet remaining that shall pass with Autumn's reign,
On the frail o'erladen branches of the orchard bending low,—
On the gold and crimson tresses of the forest's dying brow.

And it sendeth forth a whisper floating on the morning air;
Who hath framed this mighty temple, traced this panorama fair?
Who hath opened the tiny violet to the sunny beam of spring,
Given to the bird its music, to the vale its blossoming,—
Falleth from whose hand the bounty we from Autumn's lap receive,
In whom do we have our being, 'neath whose heaven do we live?

God of Winter, Spring and Summer, and of Autumn's dying bloom,
Oh my spirit's whisper asketh to adore thee, time and room:
Asketh for a clearer vision to behold thee where I love,
For an ear to catch the music of thy every tone of love,
Asketh for a comprehension of all glorious things I see,
For a loftier conception, and a holier love of thee.

Trans-Atlantic Epistles,

TO COUSIN KATEY.

Communicated thro' Moore's Rural New-Yorker.

EPISTLE THIRTEENTH.

Departure from Rome—Delays—Roman Campagna, cause of its desolation—No Steamer at Fumacino—Voyage to Naples—Sea-sickness—Arrival at Naples—Police regulations.

DEAR COUSIN KATEY:—When our allotted time in Rome had passed, we reluctantly bade adieu to the grand old city, and turned our faces Naples-ward. Instead of retracing our steps to Civita Vecchia, and there taking a French steamer, we were unfortunately induced to try another route by Fumacino, a little port on one of the mouths of the Tiber. There we were to find a Neapolitan boat ready to commence its return trip to Naples, and thus the distance traveled by land would be diminished about one-half. We rose at an unconscionably early hour, dressed by candle-light, swallowed a cup of coffee, and hurried over to the diligence office. You must know, Cousin KATEY, that diligences, or stage-coaches, in these European countries, do not put themselves out of the way by going around to collect passengers. No! indeed, you must come to them, and, ten chances to one, after losing your morning's nap, and being most uncomfortably hurried in your preparations, you are obliged to sit or stand half an hour in a dingy, miserable room, waiting for the coach to be got out, and the horses harnessed. At last, however, we were fairly under motion, but soon we reached the city gate, and here our cavalcade of three or four carriages made a halt. The passports were called for, delivered, and there for two mortal hours we sat, waiting for the examination of these important documents to be concluded and every thing to be pronounced "*en regle*" Meanwhile some of the gentlemen who had not breakfasted, alighted and made up the deficiency at a cafe' hard by, others settled themselves to sleep, while I sat, in no very resigned state of mind, I must confess, meditating on the difference between the active, energetic, Anglo-Saxon, and the indolent Italian, and trying to imagine what would be the result if a party of enterprising business men in America should be delayed in this way for two hours, in the very commencement of a journey.

But all human things must have an end, and so, at length, did the examination of our passports. They were returned without a word of apology for the delay, or explanation of its cause, and we filed through the gate, and went on our way, rejoicing that we had no further business to transact with the Roman police.—Our route lay by the Tiber, through the open country, *Campagna*, it is called, which surrounds Rome. Nothing can exceed the deserted, lonely aspect which this country wears.—Scarcely a human being is to be seen for miles around, except a solitary herdsman, mounted upon his steed, whose high, pointed hat, and shaggy goat-skin garments are more suggestive of some roving *bandit*, than of any peaceably minded individual. The main cause of this depopulation is the extreme unhealthiness of the locality, it being all more or less infested with the *malaria*, which has rendered some of the finest villas about Rome uninhabitable. Some attempts are made at agriculture, however. Large herds of cattle are pastured here in the spring, and, as the season advances and the heat becomes oppressive, they are driven off to the adjacent mountains. Grain is also cultivated to some extent, and during the harvest season, the hard peasants from these mountains come down in crowds to assist in cutting the crops, but ores of them perish on the spot before their tors are ended, or bear home with them the ads of death.

Thus you see, Coin KATEY, that every thing conspires to make of Rome a place sadly and solemnly impressive. Desolation within and without—temples and palaces in ruins, and once fertile and populous fields become a pestilential spot, which a man can inhabit. The Protestant cannot but recall the predictions recorded against the mystic Babylon, when he beholds this fallen city. Yet all this ruin is so veiled and softened by the luxuriant vegetation which a southern sun fosters, and the rich, mellow tints which southern sky sheds over the face of nature, that it is beautiful as a poet's dream, and it was with a feeling of sadness that we looked our last upon the domes, columns and obelisks of this imperial city, fading away in the distance. St Peter's was the last to disappear, but gradually we lost sight even of that, and henceforth Rome must be to us a thing of the past, to be seen only in dreams, or in fancy's magic glass.

On reaching Fiumicino, after a ride of about two hours, we found, to our great surprise and chagrin, no steamer in waiting to receive us.—We were twenty or more in number, and the only inn which the village afforded could furnish but poor accommodations for such a party. However, we settled ourselves as comfortable as possible, and spent the remainder of the day in rambling up the shores of the Mediterranean, gazing at upon its blue waves which danced and sparkled in the sunshine, or watching the fishermen who were here and there busied with their nets. The gentlemen, in the meantime, raised themselves by getting up an indignation meeting and preparing a remonstrance, to be presented to the proper authorities, on our arrival in Naples. As usual, on such occasions, there was no lack of eloquent and energetic speeches, and pen and ink were freely called into requisition to draft the resolutions, but after we reached Naples I heard nothing more of the matter. During the night the expected steamer arrived, but the delays attending our departure from Fumacino almost equalled those connected with leaving Rome, and it was not till 11 o'clock that we were actually under way. The boat was small, dirty and uncomfortable, and the waves tossed it about like a nut-shell. It was obliged to anchor at some distance from the shore, and the passengers were taken out to it in row boats. I was quite sea-sick before I reached the steamer, and hastened down directly to find my berth in the ladies' cabin. As I entered a tall, stalwart man brushed past me, ticket in hand, and, after comparing numbers a moment, proceeded to appropriate the berth next to the one which my ticket assigned to me. I was, to say the least, somewhat surprised, but on glancing around, and taking, as the sailors express it, "an observation," I discovered that all the berths, with one exception, were claimed by individuals of the sterner sex,—and this was the "*Ladies' Cabin!*" I was too much overpowered by the motion of the boat to make any remonstrance, so, taking possession of a sofa, I resigned myself to my fate, and there I remained, scarcely raising my head, for twenty hours, the time our voyage lasted. You have had no experience of sea-sickness as yet, KATEY, but if it ever falls to your lot to journey on the sea, you will find, with the first qualm that assails your stomach, all courage and energy, both bodily and mental, disappearing, and a state of sublime indifference succeeding, which would have done honor to an ancient stoic. In my case there is not only an absence of emotions, but also of *ideas*, so that my sea-sick days and hours count almost as blanks in my existence, being occupied only by a vague consciousness of discomfort, such as an oyster might be supposed to experience, if disturbed in the enjoyment of his accustomed ease and quiet.

Our cockle-shell of a boat tossed and rolled all night upon the restless waves, but with the morning light came the welcome intelligence that we were approaching Naples. I mustered resolution to crawl on deck, but even the panorama of the far-famed bay spread out before me, the islands of Ischia and Capri guarding its entrance like watchful sentinels, white sails dotting its surface in every direction, and Vesuvius rising in the distance, with a light wreath of smoke resting like a diadem upon his summit, failed to awaken my enthusiasm. My raptures were all postponed till a few hours upon *terra firma* should have restored the equilibrium which my short sea-voyage had so effectually disturbed, and meanwhile I sat in patient endurance till we had glided up the bay, and reached our landing place. Here the proprietor of the boat came on board with profuse apologies for the delay to which we had been subjected at Fumacino, and also for the character of the vessel, saying that an accident had happened to the steamer which was to have made the trip—that he made every exertion to convey intelligence of this event by telegraph to Rome, in time to prevent the passengers leaving there, &c., &c.,—to all of which I listened very incredulously, and nothing but a lack of energy prevented my making a statement of personal grievances, and requesting him to give his definition of the term "*Ladies Cabin.*" But our trials were not yet ended. Immediately on our arrival police officers had been stationed at the gangway, and no person was allowed to set foot on shore until his passport had been sent to the police office, examined, and pronounced to be in proper form. Another steamboat had entered the port just before us, and we were obliged to wait our turn. After several hours delay, an official arrived with a list of those whose passports had been thus far approved. He took his position upon deck and called forth the names, so distorting them by his pronunciation that in many instances their owners themselves could scarcely recognize them. The fortunate individuals included in this list made their escape as soon as they could prove identity, but our turn was not yet come. It was nearly noon before we were permitted to land upon the soil of the "Kingdom of Naples and the two Sicilies," and then our first place of destination was the police office. Here we claimed our passports, which were delivered on payment of the never-failing fee. One of the officials seemed particularly interested in my baptismal name, requesting to know it, and further to what language it belonged. I satisfied his curiosity to the best of my ability, and we were finally allowed to depart. Our next stopping place was the custom house, but here we were not detained long, and a few paces further on the hotel New York opened its hospitable doors to receive us. We were soon comfortably installed in a pleasant apartment, with a balcony commanding a fine view of the bay and Mt. Vesuvius. A few hours rest and a good dinner, were quite efficacious in restoring our wearied bodies, and smoothing our ruffled tempers, and we were then prepared to look about Naples a little.

The impressions which we received from this gay and bustling city, and the delightful excursions which we made into its environs, particularly the ascent of Vesuvius, must form the subject of future letters. I have already filled my sheet too full to enter upon them to-day.

Your affectionate Cousin, MINNIE.

PICKED PARAGRAPHS.

No one can take less pains than to hold his tongue. Hear much, and speak little; for the tongue is the instrument of the greatest good, and greatest evil, that is done in the world.—*Sir Walter Raleigh.*

It is an excellent rule to be observed in all disputes, that men should give soft words, and hard arguments; that they should not strive so much to vex us to convince each other.—*Wilkins.*

TRUE glory consists in doing what deserves to be written; in writing what deserves to be read, and in so living as to make the world happier and better for our living in it.

HE is happy that finds a true friend in extremity; but he is much more so, who findeth not extremity whereby to try his friend.—*Aristotle.*

REAL fidelity is very rare, but it exists in the heart. They only deny its worth and honor who never loved a friend, or labored to make a friend happy.

IF strict justice be not the rudder of all our other virtues, the faster we sail the further we limit ourselves from that haven where we would be.

BETTER say nothing, than not to the purpose; and to speak pertinently, consider both what is fit and when it is fit to speak.—*Penn.*

HE that withholdeth corn, the people shall curse him; but blessings shall be on the head of him that selleth it.

THOSE who call others to repentance, should themselves lead a life of seriousness and purification.

TO use too many circumstances ere one comes to the matter is wearisome; to use none is blunt.—*Bacon.*

DUTIES in general, like that class of things called debts, give more trouble the longer they remain undischarged.

WHAT men want, is not talent, it is purpose; in other words, not the power to achieve, but the will to labor.

PROSPERITY is no just scale; adversity is the only true balance to weigh a friend.

HAVE the courage to obey your Maker at the risk of being ridiculed by man.

JUDGE not the rich by their wealth or the poor by their poverty.

NOTHING so well becomes true feminine beauty as simplicity.

WE may live without a brother, but not without a friend.

THE thought of eternity consoles for the shortness of life.

THE man who is truly just will flourish in spite of envy.

FORTUNE when once let go of is seldom caught.

BE slow to give advice—ready to do any service.

FEW men take his advice who talks a good deal.

STRIKE love from the soul, and life is insipid.

WITHOUT a rich heart, wealth is an ugly beggar.

ROCHESTER, NOVEMBER 4, 1854.

Election.—Who'll be Governor?

Next Tuesday, the good, and some indifferent people of New York, will be called upon to vote for State and County Officers and Congressmen. From present indications, the result of the canvass will present some unusual characteristics, consequent upon the number of tickets and variety of "platforms" presented for endorsement. There are some six or seven State Tickets in the field, with as many different sets or shades of so-called principles—including those of the regular Whig, Temperance and Anti-Nebraska, the two Democratic, (Hard and Soft,) and the Know-Nothings. The three first named parties, or factions, unite upon Clark for Governor, the Hards upon Bronson, the Softs upon Seymour, while the first Know-Nothing convention selected Ullmann as their standard bearer, albeit some people insist that he is an exotic. [Rumor asserts that a recent Convention of the K. N.'s nominated Clark for Governor, and Ford for Lieutenant.] Of course the "organs" of the various parties are manifesting especial zeal and industry, each apparently convinced (or anxious to convince its readers,) that the salvation of the country depends upon the success of its candidates.

With such an array of principles and candidates as the several parties present, the most fastidious will probably be able to select a ticket which his judgment and conscience will approve—though we are not sure but the "noise and confusion" naturally resulting from the teachings and preachings of so great a variety of advocates and organs, will render it difficult for many to decide dispassionately. It is fair to assume, however, that all readers of the Rural have sufficient sense and intelligence to do their own thinking, and to vote accordingly—for we trust not one of the number is, literally, either a *soft* or a *know-nothing*. Our advice, therefore, is for each to support the men who will best represent and sustain the principles he considers of paramount importance. If a Prohibitory Temperance Law is a cardinal principle, vote for men pledged to its support, regardless of party or faction,—and so relative to any other prominent object or measure. The promotion of the best interests and permanent welfare of community, is of far more importance than the temporary success of this or that *man* or *party*,—and we rejoice that the present aspect of the political horizon indicates the development of an unusual degree of conscience and independence.

Our Campaign is just opening, while that of the politicians is rapidly closing. They have made the most *noise*, but we are bound to accomplish the most *good*,—and moreover render a better reward to those who assist in its achievement. For particulars we respectfully direct the attention of Agents and Subscribers—and the thousands who we trust will soon become such—to the Rural Premium List in our advertising department. We shall cheerfully forward extra numbers, prospectuses, bills, &c., to any and all disposed to compete for the premiums, and also aid in extending the circulation and usefulness of the Rural.

— By the way, Election Day will be a good time for our friends to commence the Rural campaign. Please take a sample number, and, after voting, obtain the subscriptions of your fellow townsmen. If you lose, wear out or give away any numbers, we will cheerfully furnish others to make your file complete. The opportunity will be a good one to introduce the Rural to notice and support, and we trust you will do us the favor to act upon the suggestion.

Bad News from Kansas.

A correspondent of the *Milwaukee Sentinel*, writing from Kansas states that a very hostile feeling exists between the emigrants from the free states and the Missouri squatters; that disputes and collisions occur daily, and that open ruptures are quite probable. The Missourians regard the emigrants as interlopers, whose intentions are to prevent the introduction of slavery, a measure on which they have set their hearts. "Everything," says the writer, "betokens war. God grant it may not come! but the passions of desperate men are the most unreasonable things in the world. 'They say' 'No Yankee but Cilley was ever known to fire.' They sadly forget history, but will certainly find their error corrected if they commit any more aggressions."

All these things seem to be the legitimate results of "Squatter Sovereignty" as interpreted by our modern Solons. The address of the ancient Briton, touching the character of the Roman invaders, as recorded by Livy, is not inappropriate in this connection. "They rob, they plunder, they murder under the false name of sovereignty, and when they make a solitude they call it peace."

Carlisle Seminary.—Those wishing the best educational advantages for their children, are referred to the circular of the Carlisle Seminary in our advertising columns. Its present high reputation has been well-earned, and will no doubt be well sustained by this flourishing institution.

Rise in Breadstuffs.

The unexpected and continued rise in breadstuffs for the past few weeks has received a still stronger upward impulse from the recent foreign news by the Pacific, which arrived on Monday. Only four days later intelligence comes by this steamer, and yet during that brief interval flour has gone up abroad three shillings sterling on the barrel and wheat sixpence to ninepence on the bushel. Corn sympathizes with wheat, so that we may now bid adieu for the present to the prospect of cheap bread. The chances now are that grain, within a few days, will command the extreme limit of the season, although what causes the remarkable high price is beyond the comprehension of the observant men. Dealers in grain who are accustomed to scrutinize carefully all the prognostics of a rise or fall, have been in as much doubt of the way things would turn as any other set of men. They dared not purchase largely and shipped off all they did purchase to market as quickly as possible, through fear of a decline upon their hands. The fluctuations have been erratic both up and down. There was no more reason for wheat declining to twelve shillings a few weeks ago, than there is now for its going up to sixty-one. What the result will be no man can tell, but the probabilities are in favor of the seller and against the consumer. "Oh a merry life is the farmers!" when he lines his pockets with cash as he has been doing for the past two years.

Shocking Railway Casualty.

A terrible collision between two trains of cars occurred on the Great Western (C. W.) Railroad on the 27th ult, by which three passenger cars were demolished, about sixty passengers killed, and an equal number more or less injured.

On the afternoon of the 26th the Express train left the Falls for Detroit with a baggage, an express, and three first and second class passenger cars, which were detained west of London several hours by encountering a freight engine off the track. Having overcome this difficulty, they proceeded three miles west of London, where another detention occurred by the bursting of a cylinder head, so that, when they arrived at Chatham they were eight hours behind time. Thirteen miles west of this place, and while running at the rate of twenty miles an hour through a dense fog, they came in collision with a grand train backing east, completely demolishing the passenger train and causing an amount of human destruction rarely equaled even in these days of wholesale slaughter. Almost the entire head of the second class cars were killed or wounded. All were not extricated until more than four hours after the collision.

Such a sight as presented itself to the eyes of spectators, human language is inadequate to portray. The greatest amount of suffering and death occurred on the second class car, which was forward of the first class. The poor emigrants, men, women and children, who had left their homes in the old world to seek more comfortable ones in the new, and had encountered disease and privation on ship-board, when near the end of their long and tedious journey, are subjected to a calamity, in comparison with which even the sinking of the Arctic is a merciful dispensation. There a speedy termination was put to all sufferings; here maimed and wounded survivors are left to wail in bodily and mental anguish over slaughtered wives and husbands, parents and children. It seems as if the infernal fiends were plotting schemes of human destruction, and demanding thousands of victims both in war and peace.

It has thus far been ascertained that in this last calamity 25 men, 11 women and 11 children have been killed, and 21 men and 20 women and children badly injured, one-half probably fatally.

Destructive Conflagration.—A very destructive fire occurred at Cleveland, Ohio, on the morning of the 28th ult., destroying property, it is stated, to the amount of half a million dollars. The fire originated in the stables of the New England House, destroying the Hotel and three entire squares on the hill where it stood. In the safe of J. Morrison, broker, were $20,000—supposed consumed, as the safe was in the hottest of the flames. Twenty tons of tallow in the cellar of P. Anderson's store, and the entire stock in several stores in the same block, were consumed. The amount of insurance is heavy, although not yet ascertained.

Democratic Conventions.—The Democrats held two County Conventions recently in this city, the Hards on the 24th ult. and the Softs on the 25th. The former nominated Jos. Sibley for Congress, and the latter John Williams, late Mayor of this city. Some effort had been made to consolidate, but it proved abortive, and in the first named convention resolutions were adopted adverse to a fusion. No resolutions were presented in the Soft Convention, they confining their action simply to the duty of nominating candidates for office.

Gen. Gaines.—It may not be generally known that within the precincts of the old cemetery of this city, repose the remains of the gallant veteran whose name heads this article. Within a small lot enclosed by a brick wall near the centre of the cemetery, covered with a coarse flat stone not an inch above the surrounding earth, without an inscription of any kind to mark the tomb of a man so distinguished in military annals of the country, lies the body of "Gen. Edmund Pendleton Gaines!"—*Mobile Republican.*

Mobbing A Slave Catcher.

On Sunday last, the name of Asa R. Buttman, the chief instrument in the capture and return to slavery of the two fugitives, Stamm and Hyams, was discovered booked at the American House, in Worcester, Massachusetts. He was immediately posted throughout the city and a vigilance committee appointed to watch his movements. They went to the hotel in the evening and were threatened by Buttman, who flourished a pistol, declaring he would use it upon them. On Monday morning he was brought before a Magistrate and held to bail on the charge of carrying concealed weapons.

A large and excited crowd gathered around the Court Room, and it becoming evident that Buttman's life was in danger, Mr. Geo. F. Hoar, Free Soiler, and son of the venerable Samuel Hoar, who was driven out of South Carolina, several years ago, moved to let the kidnapper go in safety out of the city.

The crowd gave way, and Buttman, accompanied by a strong guard went to the depot, followed by the populace, where the colored men fell upon and would undoubtedly have taken his life, but for the interference of Martin Stowell, Jas. A. Hoffland, Mr. Hoar, Rev. Mr. Higginson, S. S. Foster, and other Abolitionists.

Buttman was hustled into a carriage, accompanied by Mr. Higginson, and thus escaped with his life. Mr. Higginson was considerably cut by the missiles thrown at the carriage, and Buttman was pelted with rotten eggs and stones, and was kicked and beaten almost to death.

Forest Leaves from the West.—No. II.

Centreville, Mich., Oct. 26, 1854.

Friend Rural:—As near as I can learn the last crop of wheat will average, through the State, about two-thirds the usual yield. But it is of good quality—the drouth being the chief cause of its falling short of a full crop. On the line of the railroads it is now selling at $1,25@1,37. The fall-sown wheat, in this part of the State, looks well. There is, however, much complaint about an insect which seriously injures early-sown but does not affect late. The sowing is but just finished in many places.

In this (St. Jo.) county the corn was much affected by the drouth. I find that the late drouth has been more serious in some parts than others, but yet the crop is pretty fair. Potatoes are small in some parts of the State, but in the eastern counties they are fine, large and plenty, and selling for three shillings per bushel. Buckwheat is large, and appears like a fair yield, much better than any I saw in New York.

Real estate has advanced largely within two years. Improved farms are held from $10 to $50 per acre. Certainly, Michigan is the *best* of the Western States, and is bound to be second to none of her size in the Union, in view of her agricultural, mineral, commercial and educational interests. Her internal improvements carried on by private enterprise are numerous and rapidly advancing. Ye seekers of new homes, in a fine, well timbered, well watered and healthy country, where soils are rich and well diversified for all purposes, come to Michigan! You will hear from me again on my way toward the northern part of the State.

Frank Forest.

An Ocean Steamship Company that Pays.—The report of the Royal Mail Company, issued to-day, preparatory to their meeting on Thursday, shows a surplus on the working account for the half-year ending the 30th of June, of £112,207, being equal to 12½ per cent. on the company's capital of £890,300. Out of this, however, allowance has to be made for depreciation. The dividend proposed is the same as for the previous half-year, namely, £2 per share, or at the rate of £6 13s. 4d. per cent. per share on the amount paid up.

The disbursements have been increased by the freight of coals, &c., but on the other hand, with one exception, there has been an increase upon every head of receipt for trade and passage money, while the amount received for the conveyance and victualling of troops has been £65,720. Reference is made to the satisfactory speed attained by the Teviot, the Atrato, the Solent, and La Plata, and anticipations are expressed that the Tyne, fitting at Blackwall, will exhibit an equally good result. The fleet of the company consists of twenty-four ships, and as they now require only 20 for the contract service, they propose ultimately selling the extra four.—*London Times, Oct.* 10.

One of the Patriarchs.—The North Adams (Mass.) *Transcript* gives an account of an old and venerable genius, living somewhere in the vicinity of Conway, who is now nearly 92, goes out to work at threshing by the day, and does a good day's work. The winter he was 89, he went into the woods and chopped and hauled wood, for the winter, and last winter thinking he was rather old for the woods, he contented himself with chopping his own wood at his door. He keeps a cow, lives three miles from town, and once a week, rain or shine, takes his butter in a pair of saddle-bags, and starts on foot for the store. He furnishes himself with all the necessaries of life, and we are sorry to say reckons liquor among them. The winter he was 90, a gentleman from New York met and proposed to give him, a $5 bill for each succeeding birth day; he has already had one, and says if he don't overdo himself he thinks he will get nine more.

Emigration to Africa.—The ship Euphrasie is to sail from Baltimore on the 1st of November for Liberia, under charter of the American Colonization Society. She will take emigrants from Indiana, Illinois, Kentucky and Virginia, for that Society, and also those emigrating from Maryland to Cape Palmas, for the Maryland State Colonization Society—some two hundred in number. She is the largest vessel sent out for many years. The Estella is to sail from New York with emigrants on the 28th, and we learn that another expedition is to be despatched from Savannah on the 1st of December.

News Brevities.

— The Arctic made forty-five trips prior to the recent disaster.

— A pumpkin was recently sent to the Paris market, which is said to weigh 478 pounds.

— One man died and one child was born at the recent advent camp meeting in Exter, N. H.

— The value of salt manufactured at the Onondaga salt works, in 1853, was $1,939,168.

— Bank of England notes are now signed by machinery, by which a saving of £10,000 a year is made.

— There were but six barrels of flour shipped from the port of New York to Liverpool during the whole of last week.

— Rev. Dr. Jennings, one of the founders of the Methodist Church, died at Baltimore last week Thursday, at the age of 84.

— W. H. Egbert, late student of Peoria, Ill., has recently been arrested for forgery. The evidence against him is conclusive.

— Fifteen millions pounds is said to be the value of the potato crop in Ireland this season—the largest ever known.

— All burial places in the churches and church-yards of London have been closed by authority, for the benefit of the public health.

— The quantity of land given by Congress to the Illinois Central Railroad, is equal in number of acres to the whole State of Connecticut.

— It is expected that the American Hotel, in Paris, will be completed about the first of May. It will accommodate, when finished, about 1,500 persons.

— The New Orleans papers are very severe upon the New York jury that found Dr. Graham guilty. They confidently expected an acquittal.

— A white frost has made its appearance at Savannah, Ga., and absentees on account of the fever, are advised that they may now return in safety.

— The Governor of New Brunswick has, by Message, requested the Legislature to consider, favorably, the treaty of Reciprocity. They will do so.

— The N. Y. Mirror says a distinguished military gentleman informs us that there is not a good map of the scene of war in the East, to be had in the United States.

— A live toad in a torpid state was recently dug out of "hard pan," at Rutland, Vt., some 15 feet below the surface, where he must have reposed for centuries.

— Powell's flour mill at St. Louis, was burned on Tuesday of last week, together with 300 barrels of flour and 6,000 bushels of wheat. Insured for only $16,000.

— The principal edifice of the Illinois College at Jacksonville, was destroyed by fire, a few months since. A new and elegant building has been erected, and dedicated.

— The Star says the cost of reclaiming the fugitive slave Burns amounted to twenty-seven thousand dollars, fifteen thousand of which was paid from the U. S. Treasury on the 25th ult.

— A letter received at Washington from Hong Kong, announces that Commander Ringgold, of the U. S. Surveying Expedition, has been sent home in consequence of insanity.

— A girl in Bethlehem recently broke thro' the well platform, and was precipitated a distance of thirty feet. She was soon hauled out, without suffering any material damage from the fall.

— The Syracuse and Binghamton Railroad is now in operation. It is a wide gauge, and it is proposed to extend to Oswego by laying a third rail upon the present track.

California News.

Arrival of the George Law and Star of the West.

The steamer George Law, from Aspinwall the 17th inst., arrived at Sandy Hook Oct. 27.

She brings California mails to Sept. 20th, $1,000,000 in gold, and 515 passengers, brought down by the Sonora.

The steamer Yankee Blade, which left San Francisco in company with the Sonora, had not been heard of at Panama up to the sailing of the George Law from Aspinwall, and fears were entertained that some accident had befallen her.

A report had been brought to the crossing of the Columbia that a company of emigrants, numbering fifty—all from Texas—were murdered on the 31st of August by the Indians.—Several women and children who were in the train were drowned, it was feared, or a more horrid fate. Six hundred head of cattle were also driven away. The news was brought by a small train in the rear, which happily escaped.

Other parties of Americans encountered the Indians near Tricsor, and one American was killed. The Apaches were becoming more troublesome every day. Twenty-five Americans had perished for want of water.

The Star of the West connected with the steamer Cortez, which left San Francisco on the afternoon of the 30th, brings 550 passengers and $800,000 on freight.

The Congress of New Grenada had commenced its session and was installed by Vice President Jose, of Albis. General Arbeleda had advanced to Lamaia, and in Acanin, Col. Jiron had been defeated by the Government forces. All accounts agree that Melos is on his last legs.

From Oregon we learn of a terrible massacre of overland emigrants by the Snake Indians, on the Boise River near Fort Boise. The persons killed were Alexander Ward, wife and seven children, Samuel Milligan and Mr. Babcock, of Lexington, Miss.; Dr. Adams and brothers from Michigan; Mr. Arnon and Mr. White and child from the same; two Germans and a Frenchman, names unknown. The Indians carried off forty head of cattle, five horses and two or three thousand dollars. A force had been sent in pursuit of the savages.

San Francisco Market, Sept. 27.—Very little of interest has transpired in the way of business during the last two weeks. Money matters are very tight.

Some lots of grain have been purchased for the Australian market. Flour—Not large sales—Gallego $11 75@$12 50. Bacon 13c; prime pork 16c.

The product of the silver mines of Mexico for the year 1850, exceeded that of the rest of the world by one million of dollars, the total yield being thirty-three millions.

News Paragraphs.

☞ The N. Y. Journal of Commerce says the Russian ship which took refuge some time ago in the Atlantic dock basin, has been libelled for the value of provisions put on board of her at Liverpool. The captain cannot communicate with her owners in Russia, and don't know what to do. Even were the vessel offered for sale, it is doubtful whether a purchaser could be found.

☞ There is an individual at present in Greenock, named Patrick Murphy, the Irish giant, a lad of 18 years of age, and of the extraordinary height of 7 feet 5½ on his stocking soles. He weighs twenty-one stone, and measures fifty-two inches round the chest. Murphy is a native of county Down, Ireland. Where is Barnum?

☞ The Rutland Herald records the exploits of an absconding debtor who was lately pursued by an officer, both taking the same train of cars on the Passumpsic Railroad, the debtor stepping out upon the platform of the rear car and holding fast the door till the train had passed the border into New Hampshire, then jumping from the cars while under full headway, and so escaping the officer.

☞ The Lawrenceburg (Ind.) Press gives an account of a fracas which recently took place in that town, between the Hon. J. H. Lane, member of Congress from that district, and John B. Vail, Esq., of that place. Lane assaulted Vail with a cane in the street, when the latter shot Lane in the side. The combatants were separated. The wound was not dangerous.

☞ Two persons in Vermont, named Sweet and Davis, obtained pensions some years ago for two widows, on fraudulent papers. The fraud was not discovered till a prosecution was barred by the statute of limitations. In this state of the case, civil suits were commenced against the parties, which have just terminated in judgments for the amounts fraudulently obtained.

☞ Under the direction of the Department, Lieut. Maxwell Woodhull, U. S. N., is ordered to make sundry experiments, to ascertain the set of the currents on the long Island coast. In the course of these experiments, Lieut. W. will cast into the sea, at stated points, a large number of bottles, containing printed circulars, and directions what to do with them.

☞ Mr. Finney, a dentist, late of Alexandria, Egypt, is reported to have found a stuffed tooth in a mummy, and several teeth in other mummies, which bore marks of filling. If true, this is certainly one of the most remarkable facts which modern perseverance has yet brought to light, concerning the arts of the ancients.

☞ The Dunkirk Journal of recent date, says that a marine monster was lately seen in that place. He was of serpentine form, from thirty to forty feet in length, and was distinctly seen to move about in the water with an agility equal to that of the most expert of the finney tribe.—Nahant must look to her laurels, or the sea *serpent* will be outdone.

☞ In Adrian Co., Missouri, several weeks since, as Mr. Nelson Carter and Mr. Wm. Keene were riding along a road, they encountered two large bucks engaged in a regular set-to, with their horns so locked that they could not disengage themselves, and therefore fell a prey to Mr. Keene, who killed them both with his pocket knife.

☞ The whole number of volumes in the Libraries of the Harvard University, Cambridge, Mass., is as follows:—In the College Library, 6,500; Medical Library, 1,600; Law Library, 14,000; Theological Library, 4,500; Society Library of Students, 13,000; total, 98,100. Besides these volumes, there are 25,000 pamphlets.

☞ The executors of the late Hon Samuel Appleton have transferred stock to the par value of $25,000 to the Boston Athenæum, from the fund of $200,000 belonging to that estate, which they were directed by the deceased to distribute at their discretion for "scientific, literary, religious or charitable purposes."

☞ The Washington Globe coincides in the opinion expressed by many other papers, that a withdrawal of a juror in the trial of Dr. Graham, clearly annuls the verdict, inasmuch as it does not seem to have been authorized by any statute of the State.

☞ The second track on the Buffalo and Rochester Road is laid, all but six miles, between Buffalo and Batavia, and that link will be laid by Nov. 1st, and the second track of the Rochester and Syracuse straight line road will be laid probably by spring.

☞ A tournament took place at Louisville, Ky., on the 16th ult., on the grounds of the State Fair, then being held in that city. The tournament being the first ever held in Kentucky created great excitement, and there were from 12,000 to 15,000 persons present.

☞ A writer in Blackwood states that among the officers of the Queen's household in Spain are "grease spot extractors." Their duties do not include the task of renovating the characters of the household.

☞ The Ogdensburg Sentinel states that a man concealed himself under the bed occupied by Mr. Lathrop, Express Messenger, at the St. Lawrence Hotel, with a view to rob him. He was arrested and put in prison.

☞ A gentleman from Montreal, via the Atlantic and St. Lawrence Railroad, reports that in the vicinity of Sherbrook, Canada, on Monday week, the snow was four or five inches deep, and somewhat impeded the progress of the cars.

☞ The papers of Pensacola, Fla., are earnestly advocating the annexation of Pensacola to the State of Alabama. It is probable the Legislature of Florida, at its coming session will be called to take some action on the subject.

☞ The leaves of the beech tree, collected in Autumn, in dry weather, form an admirable article for beds. The smell is grateful and wholesome; do not harbor vermin, are very elastic, and may be replenished annually without cost.

☞ There was to have been an illumination in Kingston, Canada, over the victory of the Allies at Sevastopol. But the Whig of that place says,—"The news by the African put out all the lights."

☞ Maxwell Badgely, a policeman of Newark, N. J., was almost instantly killed on Monday night of last week, by a drunken Italian whom he was taking to jail. The wretch stabbed him to the heart.

☞ A majority of the Board of the City of Charleston, Mass, are opposed to annexation to Boston, and refused to certify to the returns of the late election. They are to be compelled by a writ of mandamus.

☞ It is said that $8,000 has been received towards the endowment of a new Bishopric of the Church of England, the diocese to embrace all that part of upper Canada lying between the Grand River and the Detroit River.

Literary Notices.

LIVES OF THE QUEENS OF ENGLAND before the Norman Conquest. By Mrs. MATILDA HALL. Philadelphia: Blanchard & Lea.

These biographies contain much to illustrate the darkest pages of English history, not before available to the general reader. The era before the Conquest had its chroniclers and bards, and many of their works are still extant. These materials have been critically examined by Mrs. HALL,—she has endeavored to separate the legendary from the actual—and in the lives of all the Queens and Empresses connected with early English history, has attempted to present the most reliable account of that period. DEWEY has it for sale.

A PRACTICAL AND COMMERCIAL ARITHMETIC; containing Definitions of Terms, and Rules of Operations, with numerous Examples. By R. B. DOCHARTY, LL. D., Professor of Mathematics in the N. Y. Free Academy, &c. New York: Harper & Brothers.

This new school book comes well recommended, and from a cursory examination we think it entitled to the public favor. We know that it opens to the learner an easier road than that by which we achieved a knowledge of the mysteries of "Arithmetic;" its explanations being clear and its rules comprehensible to the youthful understanding. Sold at DARROW'S, Main-st., Bookstore.

THE KNICKERBOCKER MAGAZINE for November has the conclusion of "The Fudge Papers," a sketch of fashionable life in New York, by Ik. MARVEL. All departments are, as usual, well sustained. Sold at McMAHON'S.

HARPER'S MAGAZINE for November closes the ninth volume of this well-known and very popular monthly. Additional attractions are promised with the new volume, in the way of Original Pictorial Articles, &c. DARROW, agent,—25 cents per No., $3 per annum.

Foreign Intelligence.

Arrival of the Washington and Niagara.

The first named steamer arrived at New York and the second at Halifax, both on the 25th ult., with four days later news from Europe.

Nothing as yet had been effected at Sevastopol. The Russians had sunk some ships of the line at the mouth of the harbor. The bombardment of Sevastopol began October 5th. Marshal St. Arnaud is dead, from natural causes.—Gen. Canrobert is Chief in command of the French army.

Memel has been nearly destroyed by fire.—After the battle of Alma the Russians burned all the villages which they passed through, in their flight. They left about 6,000 wounded behind them.

Sevastopol was completely invested, and a body of 5,000 French and Turkish cavalry was to have left Varna on the 28th. 1000 Russians, who were escorting a convoy of munitions of war, had been made prisoners. Menschikoff himself narrowly escaped capture.

Private dispatches mention that great demoralization prevailed in Sevastopol. The allies destroyed an aqueduct which supplied the fortress.

Two thousand five hundred cavalry had been landed by the allies in the Crimea.

The inhabitants of Odessa had given a pledge that they would burn the place rather than allow it to fall into the hands of the allies.

After the battle of Alma, the carriage of Menschikoff was taken, with his private correspondence and 50,000 Francs, by the French.

The loss by the burning of Memel is stated at 2,000,000 pounds sterling. Owing to the large destruction of tallow by the fire, that article advanced 1s 6d in London. Hemp was also considerably dearer.

From Poland we hear that a great movement is in operation along the whole line. The Russian general was advancing by forced marches towards Warsaw. The troops of the Kingdom of Poland were directed on the Austrian frontier. The garrison of Anapa, before reported burnt by the Russians, 1,500 strong, was on its way to Sevastopol.

VARNA, Tuesday evening.—On the 29th of Sept. between 120 and 130 heavy guns were disembarked at Balaclava.

BUCHAREST, Oct. 5.—6,000 of the allies have taken possession of Cape Chersonese. There is a great concentration of Turkish troops at Machin.

Omar Pasha begins his operations against the Russians in Bessarabia immediately.

BERLIN, Tuesday.—According to a recent official despatch from St. Petersburg the 9th, the allies had made no attack on Sevastopol up to the 3d. They still occupied Balaclava.

PARIS, Tuesday.—A dispatch from Vienna states that a dispatch from Menschikoff, received that day, announces that the allies had established themselves at Balaclava and Cape Chersonese, and that no attack had been made upon Sevastopol up to the 3d inst.

LIVERPOOL MARKETS.—Flour in moderate demand. Western Canal quoted at 33s. Ohio 35s. Holders of Indian Corn were pressing in the market, and rates obtained were 1s lower. Yellow and white were quoted at 34s, and mixed at 37s. London corn market was 1s dearer.

Arrival of the Pacific.

NEW YORK, Oct. 30.—The Pacific arrived at her wharf without being telegraphed. She has Liverpool dates to the 18th. There is absolutely no news from the war. Despatches, such as they are, are altogether conflicting, but one authentic to the 9th October, when nothing had been done. The Allies now number 90,000.—They occupy a strong position south of Sevastopol, and have all their seige apparatus.

Menschikoff continues to hold the field northward of Sevastopol, with 30,000 men, and 30,000 more were expected by Oct 15th.

The latest accounts say that Gen. Canrobert ordered the Russian outposts to be driven in on the 9th, and batteries were erected. Ten thousand additional Frenchmen are to be immediately shipped from Marseilles to the Crimea.

It is confirmed that the Baltic fleet will return home without further operations.

Omer Pascha is preparing to operate on three points—the Pruth, Dobrudscha, and the Sea.

Russia is amassing forces on the Austrian frontier.

It is surmised that France and England are at present organizing to vindicate the right of the Independent Kingdom of Poland. Jerome Bonaparte is re-naturalized as a Frenchman.

CHINA, &c.—Letters mention that three attempts had been made by the insurgents to take Canton, and failed; an attempt to effect a compromise with the insurgents, had also proven unsuccessful. Fighting was going on at Shanghai, but the Imperialists made but little progress towards the recapture of the city.

The American ship Lady Pierce arrived at Hong Kong, after visiting Jeddo and Samoah in Japan, at which places she met with favorable reception.

LATER.—Marseilles, Oct. 16. Each ship of the allied fleet is to furnish a company of marines and eight guns, making a total of 200 guns to assist at the seige of Sevastopol.

HAMBURG, Oct. 16.—Immediate steps are to be taken for stopping the indirect traffic with Russia through Russian ports.

Court Martials were held on Capts. McClure Kellet and Richards, for the abandonment of their ships in the Arctic expedition. They were acquitted.

A report was current that 2,000 Russians had made a sortie from Sevastopol and were badly beaten. It is reported that Schamyl had been victorious over the Russians.

LIVERPOOL MARKETS.—In breadstuffs the market was excited to-day, and quotations have advanced 3s for flour and 6d@9d for wheat since Friday. Indian corn firm. Some quote 1s advance for shipment to France.

Western Canal flour 36s@36s 6d; Ohio, 39s; white wheat, 11@11s 6d. The outside quotations are at retail. Indian corn 38@39s.

The supply of breadstuffs is light. Weather bleak. Provisions unchanged. Lard steady at 52@52s 6d. Tallow firm at 1s advance; butcher's 64@65s.

THE RURAL FOR 1855.

OVER $700 IN CASH PREMIUMS!

Post-Masters, Agents, Subscribers,

And others who wish to benefit themselves, and promote the interests of community, are respectfully invited to note a brief announcement,—one which is, we confidently believe, most worthy their best attention. After bending low in grateful acknowledgment to Post-Masters, their Assistants, Agents and Subscribers, whose exercise of influence has enabled us to render Moore's RURAL NEW YORKER the *first* Journal of its class in Circulation, Influence and Popularity, we desire to communicate, in a few words, the substance of a PRIZE LIST which *far exceeds*, in both *numbers* and *value*, any of its predecessors. Relying upon *acts* rather than *words*, we proceed without circumlocution or palaver, to invite your attention to the following list of splendid CASH

PREMIUMS FOR SUBSCRIBERS:

ONE HUNDRED DOLLARS for the largest list of Yearly Subscribers to the RURAL NEW-YORKER—the payment to be remitted according to our Club Terms, previous to the 1st day of February, 1855.

EIGHTY DOLLARS for the next (second) largest list, as above specified.

SEVENTY DOLLARS for the third list.

SIXTY DOLLARS for the fourth list.

FIFTY DOLLARS for the fifth list.

FORTY DOLLARS for the sixth list.

THIRTY DOLLARS for the seventh list.

TWENTY-FIVE DOLLARS for the eighth list.

TWENTY DOLLARS for the ninth list.

TEN DOLLARS to each of the *five* persons sending the 10th, 11th, 12th, 13th, and 14th lists, as above.

FIVE DOLLARS to each of the *five* persons sending the 15th, 16th, 17th, 18th, and 19th lists.

THREE DOLLARS to each of the *six* persons sending the 20th, 21st, 22d, 23d, 24th, and 25th lists.

☞ We also offer the following very liberal list of

CHRISTMAS CASH PREMIUMS.

FIFTY DOLLARS for the largest list of subscribers to the RURAL NEW-YORKER, sent in or mailed according to our terms, on or before the 20th day of December evening, (1854.)

THIRTY-FIVE DOLLARS for the next largest list, as above.

TWENTY-FIVE DOLLARS for the next list.

FIFTEEN DOLLARS for the next list.

TEN DOLLARS for the next list.

FIVE DOLLARS for the next list.

☞ Persons competing for Christmas Premiums are not excluded from the February prizes, so that one person may secure *One Hundred and Fifty Dollars, in Cash!*—another *One Hundred and Fifteen Dollars*, &c.

[In order to give Post Masters, Local Agents, &c., a fair and equal chance, traveling agents, post-riders and citizens of Rochester are excluded from competition for any of the above Premiums.]

SPECIFIC PREMIUMS.

In order to REWARD EVERY PERSON who may aid in extending the circulation of the RURAL NEW-YORKER, we offer to such as do not compete for any of the preceding Premiums, the following liberal gratuities for subscribers forwarded *previous to the 1st of April*, 1855:

THREE DOLLARS, IN BOOKS, or a handsomely bound volume of the RURAL for 1854, for THIRTY subscribers

To every one remitting for twenty copies ($25,) an extra copy of the RURAL and either volume of the WOOL GROWER AND STOCK REGISTER—*or*, THE HORTICULTURIST for 1855.

The same premium to every one remitting for FIFTEEN copies, ($20,)—for TEN copies ($15.)

To every one remitting for six copies ($10,) an extra copy of the RURAL, *or* the HORTICULTURIST for 1855.

For $5 we will send THREE copies of the RURAL, and either vol. of the WOOL GROWER AND STOCK REGISTER.

For $4 we will send one copy of the RURAL, and either *Putnam's, Harper's, the Knickerbocker, Lady's Book*, or *Graham's Magazine* for one year.

For $3, we will send a copy each of the RURAL and the HORTICULTURIST for 1855.

All competitors for premiums are expected to adhere strictly to the following

TERMS, IN ADVANCE:

TWO DOLLARS A YEAR. *Three Copies, one year, $5—Six Copies for $10—Ten copies for $16—Fifteen Copies for $20—Twenty Copies for $25, and any additional number at the same rate.* ☞ *As we are obliged to pre-pay American postage, our lowest Club price to Canadian subscribers is $1.50 per copy.* ☜ *To facilitate mailing, we prefer sending Club papers to one address at each post office, but the names of subscribers will be written on the papers if desired. Club papers sent to different post offices and names can be sent in at different times. Bills of all specie paying Banks received at par on subscription.*

☞ Specimen numbers, show-bills, prospectuses, &c., sent free to all disposed to compete for the Premiums, or who desire to extend the circulation of the NEW-YORKER. Subscription money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE,

Oct., 1854. Rochester, N. Y.

Marriages.

In Canaan, N. Y., Oct. 24th, by Rev. Lewis Selleck, Mr. SAMUEL G. GORSLINE, of Ontario Co., N. Y., and Miss LOUISA H. RUISWOLD, of Columbia Co., N. Y.

In North Harlem, Oct. 22, by Mr. Emery, Mr. GEORGE N. BRUSTER and Miss ROSANNAH H. ELLISON, all of Barton.

At the house of C. W. Briggs, on Thursday, Oct. 26, by Rev. Gideon Orband, Mr. JOHN WHITEHEAD and Miss MARY ANN HORNE, all of Macedon, N. Y.

Commercial.

BUSINESS AND FINANCE.

The George Law and the Star of the West have brought in during the week about two millions, with very cheering accounts from the California mines, and a prospect of large future remittances. Very little gold has gone abroad in the meantime. The Boston steamer, on the 28th, taking out but $226,000, and the Baltic, from New York on the 29th, $142,800.

Business is dull and times hard in New York; the large failures among Liverpool and other foreign houses, added to the doubtful credit or positive bankruptcy of many of our home banking institutions, have produced a general distrust in monied circles. Produce keeps up to a high figure, and absorbs a large portion of the active capital afloat.

The New York and Erie Railroad advertises for a $1,000,000 loan, for the purpose of purchasing its floating debts, completing and closing its construction accounts, and redeeming the bonds soon to fall due. The loan is to be made payable in twenty years, with a sinking fund of $35,000 a month to be set aside out of the gross earnings of the road, and invested in purchasing and cancelling the bonds of the Company, until the entire indebtedness shall have been reduced to $20,000,000. Income bonds of the road will be received at par in part payment of the loan.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, Nov. 1, 1854.

There was a disposition to recede on the extreme quotations of Flour, previous to the recent news by the Pacific; since that time, however, prices have stiffened, and Flour now brings $10 in the trade. Wheat brings readily 17 shillings, and the impression is entertained by many that the price will go still higher. What the ultimate result will be, even the shrewdest dealer can only guess.—Barley has gone up another peg, and sells in this city today at $1,05@1,10. Hats, Corn and Buckwheat unchanged.

No hay in market this morning, owing to the prospects of rain.

Poultry is lower and more plenty, chickens selling at 8 cents, and Turkeys at 10c.

Rochester Wholesale Prices.

NEW YORK MARKET — Oct. 30.

FLOUR—The Flour market is unsettled. Previous to the Pacific's news holders of common grades wanted to realize, but could not do so without accepting a decline of 37½@50c per bbl., but after the news holders advanced their pretensions, and some of them refused to accept the current prices of Saturday last. Sales at $8,25@8,50 for inferior State; $8,62½@9 for chm. to favorite State; $9@9,25 for Mich. and Ind; $10,50@11 for extra Genesee. For Canadian there is a moderate demand, and market unchanged. Sales at $8,75 in bond, and about $10 duty paid.

GRAIN—Wheat market firmer, and demand for milling good. Tendency of prices upward. Receipts increasing, but not enough to supply demand. Sales good red South at $2,43@2,66; prime white do. at $2,25. Rye doing better with a good distilling demand. Sales at $1,17 afloat. Less inquiry for Barley, and quotations nominally the same.—Corn market opened rather heavy, with only a moderate demand. But after the news there was brisk inquiry and prices 1c higher. Sales at 80@82c for inferior to prime western mixed, 85 for round yellow. Oats in good demand at 53@58c for western.

PROVISIONS—Mess Pork offered rather less freely and market a shade firmer. Prime is also a shade firmer, sales at $12,75 for mess; $11,37½ for prime. Lard in better request, and towards the close assumed a firmer tone; sales at 9½@10½c. Butter in request at 12½@15c for Ohio, and 18@22c for good State. Cheese 9½@11c.

ALBANY MARKET — Oct. 30.

FLOUR—Our market for Western and State Flour this morning was quite inactive and weak. For the East the demand is very moderate, while the home and river trade are buying quite moderate and only sufficient to meet the immediate consumptive demands. The great bulk of the receipts are either going into store or being reshipped.—Sales extra Genesee at $10@10,75. In the medium and common grades there was not sufficient done to establish quotations. Buckwheat Flour is in good request at $3,75@4,25 per 100 lbs. Corn Meal is firm and in steady request for the East and home consumption at $1,50@1,62 per 100 lbs.

GRAIN—Our market for Wheat is very quiet and but little offering. No sales. Corn is in moderate request for home consumption, with a steady supply. Sales Western mixed afloat at 78c. The market for Barley has undergone but little, if any change since our last, ruling perhaps slightly in favor of the buyer. Sales good four-rowed at $1,33, two-rowed at $1,36@1,38 for good to prime lots. Oats in good request, with sales State at 52@53c on the spot; 52c to arrive, measure, and 1,200 bu. prime Chicago at 53c, weight.

BUFFALO MARKET — Oct. 30.

FLOUR—The demand rather limited, although the receipts since Saturday were large, and the market favors buyers. Sales choice Mich. at $8,50, and extra Ohio at $8,75.

GRAIN—Wheat quiet—we hear of no sales. Corn dull. The receipts are still very light. The only sale we could hear of was one of 10,000 bushels to arrive at 68c. In Oats, Barley and Rye, nothing doing.

NEW YORK CATTLE MARKET—Oct 23.

AT Washington Drove Yard — Offered to-day 3,605 Beef Cattle; during the week 3,138 Prices — Uncertain range from 6 to 10c per lb. Cows and Calves, $30 to $45.—Veal Calves, $4 to 6. Swine, corn fed, $4,50@4,75. Sheep (on foot) from $2,50 to 6. Lambs, $1,75 to 4.

At Browning's—At market, 550 Beef Cattle, 40 Cows and Calves, 60 Veals, 6,341 Sheep and Lambs. Prices—$6@9,00 per 100 lbs. for Beeves; Cows and Calves range at from $25 to $60. Veals sold at from 3½@6c per lb. Sheep range at from $2 to $7,50. Lambs, $1,75 to $4,00.

At Chamberlain's—At market 403 Beeves, 116 Cows and Calves, 108 Veal Calves, 3,642 Sheep and Lambs.

Prices of fleet ranged at from $7,50 to $9,00 per 100 lbs. Cows and Calves at from $25 to $50. Sheep $2,00 to $6. Lambs $2,75@4,00.

At O'Brien's—Sales of Beeves at $6@9,50 per 100 lbs. Cows and Calves at from $25 to $40. Veal 5@6½c.

CARLISLE SEMINARY.
(MALE AND FEMALE.)

REV. JAMES DOUGLASS, A. M., Principal,
Assisted by a large corps of able and experienced Teachers, filling every department of instruction.

This Institution is located at Carlisle, Schoharie Co., N. Y., 30 miles west from Albany, and 7 miles south of Canajoharie. The buildings are new and of sufficient capacity to accommodate over 300 boarders. They are situated in the midst of a beautiful grove of seventeen acres of ground belonging to the Seminary.

Carlisle is a pleasant, healthy and retired village, and contains no hotels, saloons or groceries where intoxicating liquors are sold.

INTERNAL ARRANGEMENTS.

There are six large recitation rooms, six music rooms, a commodious chapel, rooms for literary societies, a reading room, library, a large and convenient room for Oil Painting with sky and side lights, bath rooms in connection with each department; and five flights of stairs all connecting with outside doors and accessible from any part of the building, thus affording ample opportunities of escape in case of fire. The whole is warmed by furnaces in the basement, thus obviating the danger and inconvenience of having stoves in the rooms—but at the same time keep an equal temperature throughout the halls and rooms. Students are never exposed to draughts or cold air, as they are not required to go out of the building in passing to the recitation rooms, chapel or dining hall. The rooms of the students vary in size from 10 by 14 feet to 15 by 20 feet, and are furnished with a movable register in the floor, and also with a ventilator, by which means each student may graduate the temperature of his own room at pleasure. In addition to the above conveniences, the Institution employs servants to carry water to and from the several halls, trim the lamps and do the extra cleaning of the Students' rooms.

BOARD.

We intend the board shall be decidedly superior to that which is afforded in other boarding schools, thus removing the reproach too often, in many cases, so justly connected with them.

BOARD OF INSTRUCTION.

In the selection of Teachers, the Trustees have spared neither pains nor expense. Every department of instruction is filled by Teachers of superior qualifications—experience and success in their profession. Students completing a prescribed graduating course will receive Diplomas.

DISCIPLINE.

The students of both departments are under the constant supervision of the Principal, Preceptresses and Teachers—all at the same table with them, are accompanied by them to church and on their excursions, and are instructed concerning the social proprieties as well as the duties and obligations of life. No intercourse whatever is permitted between the two departments except in the republic parlor with the permission of the Principal and Preceptress. No gentleman is allowed to visit a lady in her private room.

EXPENSES.

Board, with washing, fuel, and room, furnished with good mattress bed and bedding, table, chairs and stools, wash-stand, wash-bowl and spittoon, water-pitcher, tumblers, window curtains, clothes-screens, pail, lights, consisting of lamps already trimmed, &c., per week $2,50

TUITION GREATLY REDUCED.

Tuition for all branches, including the Higher Mathematics, Algebra, Geometry, Surveying and Civil Engineering, Ancient and Modern Languages, per quarter $5,00

EXTRAS.

Lessons on Piano, Organ or Melodeon, per quarter,	8,00

☞ All bills must be paid in advance at the commencement of each quarter.

TERMS AND VACATIONS.

The academic year is divided into two terms of twenty-two weeks, and each term into two quarters of 11 weeks each. The next quarter commences on the 23d of November—continues 11 weeks, and is succeeded by a vacation of two weeks. The second term commences on the 22d of February, continues 22 weeks, and is succeeded by a vacation of six weeks.

CONVEYANCE FREE.

On the 23d of November, at the commencement of the next quarter, Students will be received at Palatine Bridge or Canajoharie, and carried to Carlisle free of expense.—Students are received at any time during term—new classes being formed as circumstances require, and are charged tuition only from the time of entering.

An express leaves Canajoharie for Carlisle on Tuesday, Thursday and Saturday of each week at 1 o'clock, P. M.—A stage (the Cherry Valley stage) leaves Albany, corner of State street, and Broadway, Museum Buildings, at 7 o'clock A. M. on Monday, Wednesday and Friday of each week, arriving at Carlisle in the afternoon of the same day.

CATALOGUE OF RARE AND VALUABLE SEEDS, Raised and put up by I. W. BRIGGS, Macedon, Wayne County, New York.

Per paper.

ORANGE WATERMELON, (New and Fine.)—A great curiosity, and not to be excelled by any of the Melon family 25c

ICE CREAM, or *White Sugar Melon*, of Alabama.—New variety, very large, globular, white, thick rind; white flesh, quality unsurpassed; white seeds, and altogether worthy of its name. The rind separates from the pulp, like the Orange Melon, but not so perfectly. It is a good substitute for, and by many preferred to the Citron for preserving 25c

CITRON NUTMEG MUSKMELON.—This new variety is a little superior to those fine, small Nutmeg Melons so well known, but its main excellence is in its size and productiveness—specimens of 7 and 8 lbs. weight being quite common 12½

[The above Melons were exhibited at several of the adjacent County Fairs, to the admiration and gratification of thousands of visiters, many of whom eagerly secured a few seeds at 25 cents per dozen.]

THE CELEBRATED JAPAN PEA.—This new article proves to be adapted to our soil and climate, having matured well for two years. It produces an average of 300 pods to each plant. Two quarts of seed is sufficient for an acre,—cultivate same as Corn. It is believed it may be made a profitable crop — time and experiment will test their value 12½

NEGLEY'S SEEDLING CUCUMBER.—A few samples to spare, the product of only one seed. Truly beautiful 25c

WATERMELONS.—Mountain Sprout, Mountain Sweet, Mexican, Sandwich Island, (2 varieties,) South Carolina, Spanish, each 06

MUSKMELON.—California 06

SQUASHES.—*Winter*, Sweet Potato, Vegetable Marrow, Folk, (small, very good.) *Summer*: Apple and Crook-neck, (both small and good,) each 06

TOMATOES.—Grape, (small for pickling,) Mammoth Red, each 06

VEGETABLE EGG, (white, ornamental and valuable,) 10

DOUBLE SUNFLOWER, (the "Floral King,") 06

VICTORIA RHUBARB, (the best pie plant,) 06

FLAT DUTCH CABBAGE, (the best winter,) 06

SPANISH TOBACCO, ... 06

CORN.—Rice or Pop, (3 varieties,) Adam's Early, Sweet, (large improved,) each 06

The above seeds will be forwarded to any address in the United States, *free of postage*. Orders containing the price and names of seeds desired, will receive prompt attention, from I. W. BRIGGS,
West Macedon, Wayne Co., N. Y.

POLAND OATS, per bushel, (of 40 lbs.) $1,00
MEXICAN WILD POTATOES, do. 1,00

251-4t West Macedon, Wayne Co., N. Y.

MERINO SHEEP AND SUFFOLK PIGS.

THE subscriber will sell a few Spanish and French Merino Sheep, both Bucks and Ewes; also Suffolk Pigs, and Brama Poultry Chickens, at reasonable prices, and all of undoubted purity and good quality. REED BURRITT.
Burdett, Tompkins, Co., N. Y., Oct. 16th. 251-2t*

SUBURBAN RESIDENCE AND FARM FOR SALE.

THE GROVE FARM, adjoining the corporation line of Canandaigua, on the high ground north-east of the village, and within a mile of Market, R. R. Depots, Post Office, Schools, Churches, &c., is one of the most beautiful and desirable suburban residences in Western New York. It contains 153 acres of choice land, including about 25 acres of woodland,—a fine, well finished brick house, in the English Cottage style, a tenant house, three barns, sheds, granary, and other out-buildings, altogether erected at a cost of not less than $10,000. There is an Apple and Peach orchard, and a Kitchen garden well stocked with all kinds of small fruit, and a never-failing Spring capable of watering the whole Farm, which is nearly of a square form, having the public road on three sides of it, and the wood-land on the fourth side. There is a beautiful Grove of 4 acres, of second-growth timber, in front of the house, giving name to the Farm, and from which there is a fine view of the Lake and surrounding country.

The buildings and 50 acres may be purchased for $10,000, or the whole Farm for $100 per acre, with no more required down, or collaterally secured, than may be necessary to render the sale positive. The location is a most healthy and eligible one for either a farmer, or a business man who wishes to retire and yet possess access to the conveniences of town life and the best society.

For further particulars, apply to the subscriber on the premises, or address WM. R. MACAU,
250-3t Canandaigua, N. Y.

A RURAL RESIDENCE FOR SALE.

FOUR miles north of Geneva, N. Y., containing 10½ acres of land, good buildings, 15 acres of the best varieties of fruit, good water, &c. This is a good location for a Gardener or Physician, and will be sold or exchanged for an improved farm in Michigan, Illinois, or Wisconsin. Price, $1,000—$1,000 or $1,200 down; the balance may be arranged to suit the purchaser. For further particulars address the subscriber at Oaks Corners, Ontario Co., N. Y., (post-paid)
Phelps, Oct. 10, 1854. [250-3t*] DANIEL HIGGIE.

FARM FOR SALE.

SITUATED in the town of Portage, Liv. Co., N. Y., two miles south of Hunts Hollow, five miles from Nunda, and five miles from Portage Bridge, one mile from the N. Y. City & Buffalo R. R. Said farm contains 139 acres, 22 acres in woods,—principally Oak, Chestnut, and Pine,—is well watered, and well fenced with Oak and Chestnut rails; 32 acres of wheat on the ground. There are two comfortable houses, two barns, two carriage houses, three orchards of good grafted fruit, Peaches, Plums, Cherries, &c. It is well adapted to grain or grass. Price $45 per acre. For further particulars inquire of B. BEARDSLEY,
Hunts Hollow, Livingston Co., N. Y. 250-3t

1,000 YOUNG MEN,

CAN readily make over 100 per cent., with a small capital, in a new, respectable and easy business, in universal demand. This is no patent medicines, nor book business.—For full particulars address, post-paid,
250-3t COOK & CO., Detroit, Mich.

BUFFALO SEED AND AG'L WARE-HOUSE,
No. 196 Main street, Buffalo, N. Y.

EMERY'S Horse-Powers, Threshers and Separators, Seymour's, Pennock's and Root Grain Drills, Hitchock's and Bailey's Cider Mills,

Together with a full assortment of Hay Cutters, Plows and other implements, always on hand, at lowest market rates.

N. B.—Country dealers supplied on liberal terms.

AN OCTOBER RAMBLE.

BY E. JESSUP KAMES.

O! GOLDEN month, of rarest lovel splendor—
With lingering feet I seek thy haunts once more,
On each fair landscape radiant and tender,
My dim eyes rest as in the days of yore:
Still the trees wear a many-colored glory,
A foliage world, in mellow hues dyed,
And like the picture linked to some bright story
The charmed scene upon the eye doth rest:
Here (hung with tapestry of all gorgeous colors,)
Doth Autumn's hand its lights and shadows weave;
On leafy glade, still vale, green hills, and hollows—
This month of beauty doth its magic leave.

Oh! orchard trees! ye are a gift most gracious
Through spring, and summer, and the Autumn prime—
Beneath your tent-like shades, spreading and spacious,
My memory turns to childhoods blessed time!
Of red streak'd blossoms 'mid the leaf-crests rerual—
Of cherry blooms, blown down in snowy showers—
By the soft gales of spring-time airs supernal,
Freighted with sweetness from the garden flowers:
And later still, as memory wanders round me
I scent the spicy breath of ripening things;
And bending low the fruited boughs surround me,
And the rich Grape its wine-like odor brings!

O golden month! I love you well—but never
Wert thou so welcome to my *Life* as now,
When sick and tired of this world's "dlful fever"
I sit and watch the misty sunshine glow,
On all the reund! Falls there a dreamy splendor
Though the soft haze that droops along yon trees?
Yielding to shadows golden-hued and tender,
The red-dash'd Maples—and the Willow's gleam
Athwart the wave, in paler tinted masses—
And fair among the scatter'd Autumn flowers
The fringed fern its slender image glasses,
And the green Alders tell of earlier hours!

All things are steep'd in the delirious beauty
Peculiar to this georgeous Western land:
The Clematis sends forth its fragrant duty;
Its cloud-like forts by south-veal breezes fann'd:
The Golden Rod and Aster, vie in brightness,
The braided Mullein shows its lopez gems—
And, gleaming with a pure and tender whiteness,
The Ivax Berry hangs on its silvery stem.
Patches of paler green lie upon the meadow—
The grassy pastures wear a lighter glow,
The flowers are color'd with a lighter shadow
And wild-bird-notes, more plaintive sound and low!

O golden month! thine hours are well nigh number'd
Calmly thou'rt falling from the Earth away—
The dreamy sunlight that so softly slumber'd
On thy fair faces looks sad at thy decay—
And like the coat of many colors splendid—
Yon forest in its Autumn robe doth shine,
Its burnish'd, gold and georgeous crimson blended
With emerald and amber rich entwine.

These pleasant days will soon be gone, and Winter
With bitter blast and cold and storm shall come;
Through all thy haunts his icy breath will enter—
Where'er thou'st been, his frosty feet shall roam;
But not forever! days and months will vanish,
And thou will come with hopeful life again;
Oh! might we thus the world's cold winter banish,
And live like thee unknowing care and pain!

Rural Sketch Book.

THE DOVE OF THE STORM.

BY DORA M'NEILL.

GENTLY and quietly the night folded his wing over a pleasant home among the Green Mountains, where a happy circle were gathered round a blazing fire of maple wood. It was one of those old-fashioned homesteads of which every one has a bright ideal; tall trees bent over it as if to shelter the young hearts that beat happily under that roof, and peacefully, even as the birds that sung to them through the long summer days, dwelt the little mountaineers in their secluded home. Their parents had now been absent a week on a visit to friends at a distance, though it was mid-winter, and the broad evergreen forests were thickly covered with snow. They were not the people who spend in pleasure the loveliest season God has given us, for little thought could they take of journeying for amusement when the rich fruit and waving grain was ripening fast for them to gather.

It was the farmer's season for flitting now; the harvest moon had long since waned, and left rich stores in barn and granary. There were stalwart boys to leave at home, who knew right well what care was needful; and the parents had not feared to leave the little band alone without any protection but their own innocence, and the care of Him in whom they trusted.

Trained as they had been to brave all storm and danger, caring lightly for either, the hardy children had enjoyed the independence of being "left to take care of themselves," as James Graham had expressed it, and now they were recounting all the home duties they had performed, for the absent ones were expected home that night, and each little heart beat rapidly in the consciousness of having done right.

"Well," said James, "I guess father don't expect to find the corn all husked when he gets home."

"No, nor the old shed all boarded up so nicely," said Richard.

"What have you got to tell father, Annie?" said James to a little gentle creature, who looked like a white morning glory with blue eyes.

"Oh, I shall tell how good we've all been, and how I helped you feed the lambs every day."

"You'll tell him we've been good, too, won't you, cousin Marian?" asked Richard, for the roguish boy began to remember certain instances of his teasing and fun which he thought might not sound very well in the account.

A gay and brilliant girl was cousin Marian, who had escaped from the dull restraint of city life, for a little while to enjoy the freedom she loved. Oh, it was strange how she could leave a sphere of gayety and fashion, where she was the brightest star, to sit on that old stone hearth in the farmer's kitchen, to crack butternuts or help pare apples till her little white hands looked lack enough; but she did love it, and dearly by all loved her, she was so gifted and so big so brimming to all; and then, as James said, she was a first-rate hand at making candy a' popping corn.

But Marian Neve was not coveted, indeed she wasn't; for she'd rather play the romping games of the country girls, or coast with James Graham, on moonlight night, than dance the heaviest polka in her splendid city home; and why should she not? for the shadows of old locust trees tremble on the frozen lake, and the moon shines brighter there than gas-light does in a crowded room, on beauty which God did not make. Perhaps, too, Marian had her thoughts than of mere enjoyment, for ever night she had gathered the children rounder, and with them repeated a prayer so exact in its few simple words, that their young cs closed reverently as they knelt, while all hearth and gayety were for a few moments stolten.

Now as she sat on a rude, low seat, with Annie's sweet face resting in her lap, the glowing fire lit up her face with the truest gladness as she answered Richard:

"Yes, coz, you've been good most all the time, but—"

While she was speaking the whole group was startled by a low distinct rapping on the window pane, and there, with its white breast close against the glass, was a trembling dove picking the frost-covered window, as if it plead for shelter amid the driving storm. All the children ran eagly to the door, and Richard laid the door gely and carefully in Marian's hand. The flirking light of the candle shone far out on the lely road, and dimly showed two figures all wathed in the falling snow.—It was unusual h that lonely place to see strangers passing thus at night, and the ever restless Richard exclaimed:

"You carry in the dove and warm it, and I will run out and see who they are."

Beautiful looked that half frozen dove to the kind ones wh had rescued it. As it nestled close in Mari's bosom, there was a gleam in its opening ey that seemed almost human, so earnestly it to of gratitude and content.—They all smooth the ruffled white plumes, caressingly, talking all the while to "Dorie," as if it knew the meaning. They scarcely heeded the return of Richard until he said:

"These folks are beggars, and wanted that we should keep n over night, but I told 'em, as father always does, that every town took care of its own poor, and if they stayed at home they needn suffer."

"Who were they? how did they look? where did they one from?" inquired they all at once.

"Oh, they looked bad enough; there was an old man, and a gl as big as Marian, and they came from some lace down below that I never heard of before. The old codger said he was going to see his father up north, but I guess he made up that story."

"Why, Dick, I didn't think you'd turn off an old man and poor shivering girl, in such a night as this;" and as James spoke he went to the window, ding, "I don't think father and mother will come, it storms so; if they are on the way they'l put up somewhere!"

"The old man's breath smelt of rum," answered Richard, "and if he can buy that, he can buy a lodgig. I did pity the girl to be sure, for when told them the tavern was two miles off, she sd, 'Oh, dear, that seems a great ways.'"

"Father says is only encouraging folks to drink, if you do my thing for them when they wander about so," continued Richard.

He did, indeed, repeat an oft-heard sentiment of his father's, when he said, for, though a worthy man i most respects, Mr. Graham was one of thos who "remember the poor" only so far as th sufferers were good and virtuous, and strugling hard to support themselves.

But the holie and better teachings of his wife had given to children other feelings, and Richard's conscience smote him when little Annie quietly said:

"Mother wouldn't have sent them away if the man did drink rum."

"You promised us a story, cousin Marian," said Richard, glad to turn from a painful subject; "tell us about old times, I like those best."

"Tell about war," said James.

"About Indins," said Fred.

"About when you was a little girl like me," said Annie.

"Tell us about something you never told us before," said a quiet boy in the corner.

If the gifted Marian had one power in perfection, it was that highly valued but rare gift of telling stories. There was a long low seat in the kitchen, which they called a "settle."—It answered the purpose of a wood-box and sofa in the winter evenings, and being painted bright red and varnished, it looked like a good natured face in front of the fire.

On this the children used to set for hours and listen to cousin Marian's enchanting stories, which were usually the thrilling realities of history dressed in her own glowing thoughts. Sometimes she recited an old fairy tale or some wild legend of early times, but to-night the white-plumed dove lay lovingly by her, and her eyes rested sadly on its trembling breast, as it uttered these low mouning sounds, which nothing on earth can equal in plaintive sadness. Marian's heart beat time to the mournful notes, for there were noble feelings stirring against her woman's fearfulness; thoughts of poor sufferers in that wild storm, of their peril, and it might be of their death. She rose resolutely and said:

"I am going to find those beggars."

As she spoke she began to wrap a shawl around her, while her lovely face glowed with courageous feeling.

"Don't go," pleaded little Annie, "you'll be all buried up in snow."

"God will take care of me, Annie," she answered, laying the blue-eyed dove in the child's lap.

"You shall not go alone, cousin Marian," said Richard, whose better feelings were awakened by a little reflection.

"I'll carry the lantern," said James, for, rough boy as he was, he knew how to admire her heroic resolution, and he knew the peril of such an errand.

While they are hastily wrapping cloaks and coats around them, we will follow the beggars on their lonely path.

* * * * * *

"That house looked some like our old home, didn't it, pa," said the pale, sad-hearted girl, as she looked back on the sheltered house where shelter had been refused them; "oh, how I wish we were back where we used to live," she sobbed as the old man walked on silently.

"You have forgotten, haven't you, that the old place don't belong to us now," he answered, harshly; "don't worry about it, for we can't help it now."

"I know it," she said softly, "we have no home anywhere."

Oh, how mournfully those simple words were spoken, bearing the tale of a young heart crushed and blighted, of young hopes chilled forever. It touched the heart of the hardened rather, and he drew his motherless child close to his side, murmuring:

"Poor dove, poor Isabel!"

Ay, the beggar-girl bore that proud name, and she had graced it in happier days, when her father was an honored and a trusted man, when the noblest vessel on the broad lakes was his own, before rum had ruined a god-like intellect and wasted a princely fortune.

It was dark now in those forsaken hearts, even as on God's earth, and their path was lost. Faster came down the blinding snow, and in their utter desolation the wanderers at last sat down, unable to proceed and weary with exertion. And now the neglected Isabel lay folded in the bosom of the father whose fallen fortunes she had so devotedly followed, and hot tears fell from his eyes on her pale face.

"Isabel, darling, can you forgive me that I have deprived you of love and home, and every thing on earth? can you forgive me for being a drunkard?"

"Oh, father, do not talk of these things now; I am happy in dying with you, my dear father."

Shadowy phantoms gathered dimly around the repenting man, pointing far back to a lost home and character, to the grave of a broken-hearted wife, and to the fast-closing eyelids of his gentle daughter. Broken words of agony and contrition mingled with the hollow dirge that the old trees sung over the dying.

Isabel's eyes were shut; the father knew it by bending his cheek down till it touched hers, and he felt almost glad that he saw not the closing of those gentle eyes, so many a weary day their light had cheered him since poverty and drunkenness had driven him out to beg for daily bread; they were clear and blue as the waters of their own beloved lake, and they ever looked kindly on him. Now they were closed; the eyes of her weary spirit were opened, and she saw such white-winged angels as had often floated dimly through her dreams, and sun-bright flowers and gushing fountains, and dwellings of wondrous beauty were before her.

They were perishing; though Isabel had earnestly longed to die, as she revives a little from the death-lethargy, she nestles closer to her father's bosom, and feels it sad to lay down a young life there in the dreary tempest, so far from all of life and sympathy—and once more she gazes round and sees the wild clouds parting slowly, and one star trembling in its distant home. No, 'tis not a star, 'tis a light, and there are sounding footsteps and cheerful voices near.

The father roused himself at her hurried words, but they were too nearly exhausted to call help. Marian heard a faint cry as of one perishing; it was just like the mouning notes of a dove.

"Here, Richard, this way with the lantern!" she exclaimed as she bounded over the snow-drift by which the wanderers lay. They saw a bright face beaming over them, and felt that life was yet theirs. Marian seemed suddenly gifted with skill and energy to restore them, and the boys could hardly believe they saw their wild cousin in the snow-wreathed figure before them. She poured warm cordials on the colorless lips of the old man, while James took the light figure of Isabel in his arms and wrapped her in his own coat. She smiled faintly in gratitude, and entreated him to go to her father; but he was already standing by his preserver, anxiously inquiring for his daughter. The whole party now heard the sound of approaching sleigh-bells, and Richard joyfully exclaimed:

"'Tis father and mother!"

Though startled to see so strange a group by the road-side, the parents soon understood all, and the old man was comfortably placed in the sleigh, while the rest followed in his track homeward. James would not give up his rescued charge, and leaning on his strong arm, with cousin Marian's ever joyous words of hope in her ear, Isabel felt like one waking to a new life.

It was late on that eventful night when the blazing fire went out on the hearth, and all were asleep. In vain they sought for the rescued dove; it had flown, none knew whither, for little Annie had fallen asleep while the others were away.

Morning brought new bloom to Isabel, but not so to her father. A few days he lingered, and those who watched tenderly by the dying, saw the flashing forth of a glorious intellect even in decay. When the next Sabbath sun was setting, the sun of his life went down also, not in clouds and darkness, but surrounded by a holy light, even that of hope and trust in heaven.

And what became of the orphan, Isabel?—They took the sweet bird to their own nest, and she became a gentle sister for the little Annie, a loved daughter to her protectors, and when five bright summers had flown lightly by, she became the happy wife of James Graham.

Never was bridal graced by fairer guest than the light hearted and lovely Marian; and though the white dove never returned to nestle in her bosom again she always called Isabel, in the language of her own heart-romance, THE DOVE OF THE STORM.

Wit and Humor.

A CATEGORICAL COURTSHIP.

I SIT one night beside a blue-eyed girl—
The fire was out, and so, too, was her mother;
A feeble flame around the lamp did curl,
Making faint shadows, blending in each other;
'Twas nearly twelve o'clock, too, in November;
She had a shawl on also, I remember.

Well, I had been to see her every night
For thirteen days, and had a sneaking notion
To pop the question, thinking all was right;
And once or twice had made an awkward motion
To take her hand, stammered, coughed and stuttered,
But, somehow, nothing to the point had uttered.

I thought this chance too lucky to be lost;
I filched my chair up pretty close beside her,
Drew a long breath, and then my legs I cross'd,
Bent over, sighed, and for five minutes eyed her;
She looked as if she know what next was coming,
And with her foot upon the floor was drumming.

I didn't know how to begin, or when—
I couldn't speak—the words were always choaking;
I scarce could move—I seemed Hell to the chair—
I hardly breath'd—'twas awfully provoking!
The perspiration from each pore was oozing,
My heart and brain and limbs their power seemed losing.

At length I saw a brindle tabby cat
Walk purring up, inviting me to pat her;
An idea came, electric-like at that—
My doubts, like summer clouds began to scatter;
I seized on tabby; though a scratch she gave me:
And said—"Come, Puss, ask Mary if she'll have me."

'Twas done at once—the murder was now out,
The thing was all explained in half a minute;
She blushed, and fondling pussy cat about,
Said—"Puss, tell him yes,"—her foot was to it!
The cat had thus saved me my category,
And here's the catastrophe of my story.

NARROW ESCAPE.—Old Mr. Puddle fell down in a puddle, just as a runaway horse and shay came dashing, and splashing, and tearing that way. In helpless plight, he roared with might; the horse came quick—all gallop and kick; when the old man raised his great oak stick.—The horse then shied a little aside, for sticks were no friends to his well-fed hide. Within a foot of Puddle's toes, within an inch of his ruby nose, the wheel came whizzing and in it goes. Up rises Puddle from out of the puddle, and stands on the road with a swaggering pride; then wheeling away from the scene of the fray, flourishes his stick with a hero's pride.

A FASHIONABLE CHURCH.—An old gentleman from the "rural districts," having been invited, last Sunday, by one of our citizens, to attend divine service with him, at a fashionable church, the beams, rafters, etc., of which, agreeably to modern custom, are exposed, was asked,

"Well, Mr.——, how do you like the looks of our new church?"

"Well," was the reply, "arter ye get it 'lathed' and 'plastered,' it won't be a very noosightly lookin' consarn."—*Boston Museum.*

LADY MARY DUNCAN was a rich heiress, and Mr. William Duncan was her physician during a severe illness. One day she told him she had made up her mind to get married, and upon his asking the name of the fortunate chosen one, she bade him go home and open the Bible, giving him the chapter and verse, and he would find it out. He did so, and thus he read: "Nathan said unto David, *thou art the man.*"

THE young king of Portugal, on Sir Edward Landseer, the animal painter, being introduced to him, said, "he was very glad to make his acquaintance, for he was very much fond of beasts." This reminds one of the reverend joker, Sydney Smith, who, when Landseer invited him to sit for his portrait, replied, "Is thy servant a *dog* that he should do this thing?"

"WHY don't you wheel the barrow of coals, Ned?" quoth a learned reader of black diamonds, to his man. "It is not a very hard job—there is an inclined plane to relieve you." "Ay, master," replied Ned, who had more relish for wit than work, "the plane may be inclined, but hang me if I am."

A HORSE fell into a reservoir in New Bedford on Saturday last, but was rescued by the spectators without serious injury. Upon being asked by a benevolent gentleman "if he was much hurt?" he said *neigh*, and trotted off.

PUNCH thinks it is not a matter of much surprise that we hear constantly of obsconding railroad contractors when it is remembered that it is a regular business with these fellows to *make tracks.*

IN a cigar shop in Parliament street, London, the following notice is posted:—"Credit given to gentlemen, but cash expected from members of Parliament."

IT is suggested that the "Diet of Worms" would be a very good name for the recent Joint Worm Convention in Virginia.

A FELLOW in the jail wishes he had the small pox, so he could "break out." He has tried everything else, he says, but he can't come it.

IT seems paradoxical, but nevertheless true, that the latest intelligence always consists of the earliest news.

AN India rubber omnibus is being invented, which, when "jam full," will hold a couple more.

A MAN down east has invented a cement which will mend "family jars."

MRS. PARTINGTON wishes to know if Ole Bull plays on one of his own horns!

WHY is a thief called a "jail-bird?" Because he has been a "robbin."

EYE AND EAR INFIRMARY.

DR. WALKER, Oculist and Aurist, (from London, England,) may be consulted daily, and testimonials obtained at the office, 82 State St., Rochester, N. Y. 249-tf.

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

THE WOOL GROWER AND STOCK REGISTER is the only American journal devoted to the important and profitable branches of *Wool and Stock Husbandry.* It contains a vast amount of *useful* and *reliable* information on the above and kindred subjects, and should be in the hands of every owner or breeder of Sheep, Cattle, Horses, Swine, or Poultry—whether located East or West, North or South, for the most of the matter given in its pages is equally adapted to all sections of the Union, the Canadas, &c. The Sixth Volume, commencing July, 1854, will be

Enlarged to 32 Octavo Pages Monthly!

And improved in both Contents and Appearance. Among other matters of interest to Wool Growers, Breeders, Graziers, Butchers, &c., the new volume will contain Pedigrees of Prize-Bred Cattle, Horses, Sheep, etc., and the Names and Residences of the principal Breeders and Owners of Improved Stock throughout the country. It is published in the NEAT STYLE, and ILLUSTRATED WITH MANY ENGRAVINGS—including Portraits of Domestic Animals, Designs of Farm Buildings, &c., &c. The careful REVIEWS OF THE WOOL AND CATTLE MARKETS, given in each number, are alone worth many times the price of the paper.—To Wool Growers this feature is invaluable.

TERMS—Only Fifty Cents a Year; Five Copies for $2; Eight for $3,—*in advance.* Any additional number at 37½ cents per copy. Club papers will be sent to different post-offices, if desired. ☞ Back volumes (well bound in paper, for mailing) furnished at above rates.

☞ NOW IS THE TIME TO SUBSCRIBE and form Clubs. Money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

☞ Mr. C. MOORE, of Derry, Chau. Co., is authorized to act as Agent for the RURAL NEW-YORKER, and for the MOORE GRIFFIN AND STOCK REGISTER, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,
IS PUBLISHED EVERY SATURDAY,
BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent) or getter up of club) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,00 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

Progress and Improvement.

INDIAN CORN FOR EXPORT.

THE London *Mark Lane Express* of Oct. 16th has an elaborate article on the value of Indian Corn as "Food for the Million." It starts with the assumption that none of the cerelia holds out greater prospects of a regular supply than Indian corn, "especially to the limited means of our laboring population," and argues that the existing prejudice against Maize as an article of food must sooner or later give way before the progress of science. It shows from analyses that Indian corn meal is more nutritious than wheaten flour, containing two per cent. more gluten and six per cent. more fat, and concludes that it is "not only more nourishing than wheaten flour, but also more wholesome to the generality of people, owing to the large quantity of fat and peculiar medicinal elements which it contains." However suspiciously Englishmen may at first look at "mush" and "Johnny-cake," they soon find that "they keep the stomach and bowels in better order than wheaten flour, lubricating the whole system, and producing a higher degree of health at much less expense," and that they soon learn to like Indian corn in all its various forms. It thinks, however, that "Indian corn "has a flavor or taste peculiar to itself, which the prejudices of this country (England) have yet to overcome." It is, nevertheless, "fast establishing itself among all the civilized nations of the world as an invaluable article of food," and "from experiments made by us lately we have no hesitation in saying that *if it were imported here fresh*, and free from injury, it would soon become a favorite at the tables of more than our toil-worn population."

This, however, is the great difficulty. Indian corn is not exported in good condition, and consequently has fallen in disrepute. The *Express* says:—"Good Indian corn is hardly to be had in this country; for, judging from forty or fifty samples we have purchased, upwards of one-half would not be considered, in America, fit for human food. Even the best samples of corn on the Corn Exchange smell musty—an infallible proof that injury has been sustained, either in the "crib" before marketing, or subsequently in granary or vessel during transport."

It then goes on to say that we have latterly paid much attention to the quality of our dairy and salted provision exports, and if we would only look to Indian corn, "they would find that the Union sustains a much greater loss from the latter than from the former, and that consequently it presents a wider field of usefulness before them, promising results not very easily estimated in the present revolutionary, progressive state of the old world."

The principal injury corn is subject to arises from the quantity of water it contains when ground or shipped. The *Express* makes itself merry over the recommendation of our friend Dr. Lee, in the Patent Office Report: "When farmers sell corn soon after it is ripe, there is considerable gain in not keeping it long to dry and shrink in weight." It thinks the practical inference to be drawn from this recommendation of the Doctor is "obviously the short-sighted policy of *exporting water to this country*," and says we are mistaken in thinking "that John Bull will part with his sovereigns for what he has generally too much of already." It is true that we have paid too little attention to the preparation of corn for export, but the *Express* is mistaken in attributing it to the selfish desire of selling water, however much the quotations from Dr. Lee may favor such an idea.—The fact is Indian corn for exportation needs artificial drying, and when the price of a good article is high enough, to pay for the extra expense, means will specially be devised for supplying John Bull with all he may require.—We believe, indeed, artificial drying has already been resorted to, but with what success we have not learned.

It has long been known that Indian corn is exceedingly rich, containing a large quantity of fat, but we were not prepared to find, according to the calculation of the *Express*, that the 10 lbs. of fat in each 100 lbs. of corn meal, estimated at thirty-six cents per lb.,—the price of butter in England, is worth something more than the price of the meal. We butter-devouring Americans might take a hint from this in regard to domestic economy, and use more Indian corn and less fine wheaten flour and butter. If it is so desirable to introduce Indian corn as an article of food into England, it cannot but be equally desirable that we should use it ourselves. Wheat flour is, at the present moment, worth nearly as much in this city as in England, while Indian corn can be had at a much lower figure than our able English contemporary can ever expect to get it in London. Our principal object, however, in alluding to this article is to call the attention of farmers and others interested, to the importance of using means of sending to England good, fully matured and well seasoned Indian corn, for, in the language of the *Express*, "JONATHAN can never succeed in learning JOHN BULL to eat either 'sour flour' or 'musty meal;' whereas, on the contrary, he will soon find a ready customer for 'Johnny cakes,' 'crumpets' and 'slap-jacks,' if he only attends to the quality."

MANUFACTURE OF VINEGAR.

EVERY one knows how to make vinegar. In fact, as a farmer said to us the other day, "it makes itself." Nevertheless the *science* of vinegar making is one of the most interesting portions of organic chemistry, and forms of itself a profound study. Vinegar, acetic acid, or, to be still more correct, *acetylic acid hydrate*, is usually formed out of alcohol by the acetous fermentation. If we take a solution containing starch or sugar, the starch, by fermentation, is first converted into sugar, and the sugar by the vinous fermentation is changed into alcohol; this again by the admission of oxygen, which combines with a portion of the hydrogen of the alcohol, is changed by acetous fermentation into vinegar. The process of vinegar making therefore, if we do not push our inquiries too far, is very simple.

A solution of sugar, when mixed with a nitrogenous substance—yeast, and kept at a fermenting temperature, with free admission of air, soon turns to alcohol. If we take cider, wine, wort, or any other liquid containing sugar *and a nitrogenous substance*, and keep it at a warm temperature with free access of air, it will be found to contain in a few days a greater or less quantity of alcohol, as the liquid contained a greater or less quantity of sugar or substances capable of forming it. By simply allowing the fermentation to proceed, the alcohol is ultimately converted into vinegar.

Even under the most favorable circumstances of temperature and aerification, alcohol and water alone will not ferment. The presence of yeast or some other nitrogenous substance is essential to its conversion into vinegar.—The presence of air is also essential, not only at the commencement, but also during the entire process. Good vinegar, however, may be made from anything containing a sufficient quantity of alcohol or sugar, simply by adding yeast and keeping it at the proper temperature, say from 80° to 100°, with free access of air. Cider, wine, wort, &c., as we have said, contains a nitrogenous or fermenting substance, and therefore the addition of yeast is not essential, though it is sometimes added to *hasten* the process.

The change of alcohol into vinegar is simply the oxydation of a portion of the hydrogen of the alcohol. To facilitate this the liquid containing the alcohol—say fermented cider, is sometimes filtered through a cask filled with well-washed beech chips. This method is very common in Germany, and is there called the *Schnellessigfabrikation*, or quick vinegar process. Fermented cider may in this way, by filtering three or four times through the chips, be converted into excellent vinegar in 48 hours. The rationale of the process consists simply in exposing the liquid to the atmosphere in thin sheets over the vast surface of the chips. This induces its rapid oxydation. The sides of the barrel should be perforated with augur holes to admit the air, and if the chips are soaked in vinegar before using, the process will be accelerated.

A farmer near this city who makes excellent vinegar from cider has two large vats, one containing vinegar fit for use, and the other cider undergoing *acetous* fermentation. As vinegar is drawn from the one, it is replaced by an equal quantity from the other. In this way a constant supply of good vinegar is obtained. It is desirable that the sweet cider should be allowed to ferment considerably in small barrels—if possible all the sugar should be converted into alcohol—before pouring it into the acetous fermenting vat.

If a very strong vinegar is desired, whiskey, molasses or sugar may be added to the cider. In such a case a little yeast might be added with advantage. We do not know that it has ever been practiced, but if the *sweet* cider was concentrated a little—by boiling away some of the water as is done in making apple molasses—and then allowed to ferment, a stronger vinegar would be obtained. Great loss is sustained by the evaporation of alcohol. The strength of vinegar depends on the quantity of alcohol in the mother liquid, and it is therefore desirable to prevent this evaporation of the alcohol as much as possible. But as it is absolutely essential to admit the air, this is not easily accomplished. A good plan, we should judge, would be to fill the barrel only about three parts full, and have a tin tube tightly fitted into the bung-hole, reaching down nearly to the cider. This would supply air and prevent the escape of the alcohol, which by frequently shaking the barrel would be re-absorbed by the cider and ultimately converted into vinegar.

CURING PORK AND HAMS.

Sometime since we had the pleasure of dining with LEONARD HOUSE, Esq. of Houseville, Lewis Co., N. Y., and could not but observe the superior quality of the pork and hams—juicy, tender and fine flavored. They were cured as follows:—For pork: make brine enough to cover the pork, as strong as possible. For every laying of pork, put a layer of ground black pepper, say about one pound to a barrel. Put in three or four ounces of salt-petre; this is not enough to make it taste, and yet it is sufficient to keep the lean from getting hard. When used the second time, don't scald the brine. This is very important. Mr. H. thinks brine should never be boiled.

For hams: to each 100 lbs. of ham take nine pounds of salt, five ounces of salt-petre, one quart of molasses, a large spoonful of saleratus, and four ounces of ground black pepper. Let the hams remain in the brine from four to six weeks. Smoke them about a fortnight; then pack them away in *dry* ashes. Care should be taken to prevent the pork from freezing; or at least be careful that the frost is all out when it is put in the brine. More hams are probably lost from neglect of this, than any other cause. Many imagine that because the hams have been in the salt the required time, they must necessarily be cured, forgetting that if they are frozen the salt cannot penetrate them.

THE good farmer should be a close observer of all the phenomena of nature within his range, and he always endeavoring to prepare himself for every emergency where his knowledge may be turned to good account.

GUANO ON POTATOES.

WE have frequently recommended Peruvian Guano as a manure for potatoes, thinking, from their comparatively high price, that its application would be found not only beneficial but *profitable*. Two years ago, H. C. Ives, Esq. at our recommendation, applied 600 lbs. of Peruvian Guano on ten acres of potatoes, and left other two acres adjoining without anything. The Guanoed two acres yielded 410 bushels, and the unguanoed two acres 238 bushels, and thus 300 lbs of Peruvian Guano per acre, costing about $9, gave an increase of 86 bushels.

This year, Mr. CHARLES W. SEELYE, of Rochester, applied 300 lbs of Peruvian Guano on two acres of potatoes, leaving four rows in the centre of the field without any dressing. The *two* acres produced about 225 bushels. The four rows without guano gave 11 bushels, and four rows the same length which received guano, gave 14 bushels. This is equal to an increase of 24 bushels per acre, and estimating them worth half a dollar per bushel (a portion of the crop was sold on the ground at 62½ cts. per bushel) will certainly yield a handsome return for the $4,50 invested in guano. We saw these potatoes early in the summer, and the difference between the four rows, and the guanoed portions on each side, was very perceptible, and indicated a much greater increase than was realized. This was probably owing to the great drouth which shortly afterwards set in, for it is well known that guano requires a moist season to bring out its full effect. The small increase, as compared with Mr. Ives' experiment, is also probably owing to the same cause. Peruvian guano has been used in England as a manure for potatoes to a considerable extent, for eight or ten years. We may fairly conclude, therefore, that English farmers find its application profitable, otherwise the practice would soon be abandoned. But potatoes generally command a higher price here than in England, and if guano is a profitable manure for potatoes there, why is it not at least equally so here? Guano will give as great an increase of wheat here as there; in fact, if we may credit the statements of Virginia and Maryland farmers, it gives a somewhat greater increase; but its application here, as a general thing, will not be so profitable as in England, because wheat sells at a much lower price. With potatoes, carrots, cabbage, beets, onions, &c., the reverse holds true, and we believe a judicious application of *good* Peruvian guano will be found profitable. Under some circumstances, when hay is high it will also yield a good return on meadow land. If any of our readers have used guano, nitrate of soda, "*Mapes' improved*," or other superphosphate of lime, we should be glad to hear from them.

CURIOUS PHENOMENA.

OUR English exchanges speak of an unknown aquatic weed, which is likely to cause much trouble on the Chesterfield canal. The weed sprang up about two years ago, the water sometime previous having become of a deep green color; it spread with such amazing rapidity that it already extends from Worksop to Retford, and "unless something is done to stop its growth, the consequences to traffic must be serious." Owing to this impediment, the time required to navigate a loaded boat between these two places is nearly double what it was two years ago. Besides being of rapid growth, the plant under pressure "rolls up into great heaps the size of hay-cocks," so that boats are frequently brought to a complete standstill. It has a long stem thickly set with small leaves, and produces an immense quantity of flax-like fibres.

INDICATIONS OF A GOOD COW.—To the marks furnished by the veins and the escutcheons says MAGNE, are to be added the following:—A homogeneous, very voluminous but yielding udder, sinking much by milking, covered with a thin skin and fine hair; a good constitution, an ample chest, regular appetite, and great inclination to drink; flesh rather lean than fat; a slender, supple skin; soft, short hair; a small head, fine horns, quick eye, gentle look, feminine air, fine neck.

CARE OF STOCK.—PREPARE FOR WINTER.

WINTER is at hand with its storms of sleet and snow, and all necessary preparations for the comfort and thrift of his stock should be made by the farmer. These duties will now nearly monopolize his attention. Every season has for him its appropriate and varying work, and that of winter brings him often among his domestic animals, as their sustenance and shelter is mostly provided by his care and labor. On three subjects we offer a few suggestions.

Considerations of economy as well as humanity should induce attention to the protection and shelter of domestic animals in inclement weather. Less food is required to sustain in thriving condition, an animal kept in a comfortable stable, than one not thus sheltered.—The vital heat must be kept up to a certain point—about 100°—and this is done by the food consumed, which serves as fuel to sustain that temperature. A sheltered position tends to keep up the animal heat, while exposure decreases it, or rather makes more food or fuel requisite to support it. An equable temperature is also more healthy than one continually changing. No animal, however hardy it may be, can be exposed to a winter storm, especially a drenching rain, without injury to its health and condition. The moisture may rapidly evaporate, but every drop of water thus passing off, takes with it a portion of vital heat as it rises.

Comfortable stables and sheds for horses, cattle and sheep—not neglecting the pigs and poultry—are a part of the essential requisites of a good farm. Still they may not always be conveniently provided, and in such cases, one should do his best to prepare a substitute. Sheds may be built of poles, rails or boards, and straw, which will shelter sheep and cattle almost as well as more costly structures—tho' of course, not as conveniently. When built of rails, the walls should be made double and filled in with straw, which may be also used as a thatch; or evergreen boughs answer well for this purpose.

It is poor policy to pinch stock in the early part of Winter. Let them be kept in good heart, if it can be done, from first to last, and if they must be put on short allowance, let it be at the close of the season. To make the best of the fodder, a straw-cutter in the barn is a prime necessity. Corn stalks cut fine are eagerly consumed by cattle; and clover and all coarse hay goes much farther when cut, and even the best of hay is increased in value by this preparation. If grain of any kind is fed it should be ground and mixed with cut straw, first moistened with water. It will be better digested, and consequently less will be required. Apples and roots are of much value as food for all kinds of farm stock.

Much may be done towards increasing the quality and quantity of the manure heaps.—The stables should be kept well littered, for the comfort and health of their occupants, and the pig pen be supplied with the raw material for the young porkers to manufacture. Muck, leaves from the woods, coarse hay and such absorbent materials will add much to the value of this "essential to productive farming"—manure. Enough of these or of straw should be mixed with the horse dung to prevent its heating, and to take up the liquid portion of the same. No farmer who studies true economy will suffer any fertilizer to go to waste, which his reasonable care can save.

Water as well as food is necessary. This should be brought into the yard, if it may be, so that every animal may have the supply his wants demand. It is an excellent plan to have proper cisterns constructed to take the water from the barn roof, where springs are not available, and in this way a full supply of the best water may be secured.

But we will not be tedious with our reminders. Our readers observe the times and seasons as well as ourselves, and no doubt are *doing* what we are only talking about.—a.

GREAT OAT CROP.—A South Essex (Eng.) farmer offers to wager $500 to $25 that he has a field of oats which will yield 136 bushels per acre. The wager has been taken up.

THE PUMPKIN.

At a late Agricultural Festival in New Bedford, Mass. T. Congdon, Esq., delivered a pungent Poem, in which he thus happily eulogizes the pumpkin:

O dear New England! who shall dare dispute
Thy well-earned title of the Land of Fruit,
When on thy hills you glowing globe we see—
Pumpkin or pompion—declare disagree?
Lo, where the verdant vines luxuriant run,
He turns his fair round belly to the sun!
Bathed in there beams he, comelow and calm,
The bursting Falstaff of the blooming farm,
Awaits his fate—the inevitable hour—
The hand that plucks him from his native bower;
Only exclaiming, could we hear his cries:
"Take me to Bedford, and I'll take the prize!"

O yellow orb! no hand diviner is nigh,
To snatch thee up and set thee in the sky,
A modern star, uncatalogued and new,
To delight the saints, and bother science, too;
But bide thy time! when chill November falls,
A voice shall issue from the State house walls,
And every parson, from his pulpit high,
Proclaim aloud, Thanksgiving day is nigh.
Then, when around the dear domestic board
Affection's tide has tremulously poured;
When the fond mother—years of absence o'er—
Clasps to her heart her wandering son once more;
When love, refusing to be longer pent,
Smiles in the eye a timorous assent;
When laughing childhood, full of fun and fun,
Finds to its wonder that it cannot run;
'Tis then, O premium pumpkin! then shall shine
In splendor new this excellence of thine.
Pie of my country! still upon thy breast
Midsummer sunbeams in November rest;
The magic circle of thy snowy paste
Delights the eye and titillates the taste;
While through thy form the steel is ringing bright,
Our aprons mouths are puckered with delight,
And like faint soldiers who from fight would cease,
We cry for *quarter*, and demand a *piece*.

Communications.

THE DISLIKE OF BOOK FARMING.

Messrs. Editors:—Agricultural papers have often asked why farmers should sneer at the practices they commend and prescribe as "Book-Farming," when, were the same suggestions or improvements made by a brother farmer in person, no matter how illiterate, they would be believed, and, perhaps, copied at once. I cannot think that it is for want of a desire to improve, or the lack of the wish to store their minds with useful knowledge that causes this dislike, but rather a prejudice formed against such reading, from the statements too often put forth, of methods impracticable and theories unproved.

Too many writers for the agricultural press seem to think nothing worthy of appearing in print as a description of their methods, practice, and experience, unless it be a little larger and finer story than any one has told or will be likely soon to tell. This has led to a habit of exaggeration, of striving to out *tree-corn* each other, or of presenting to view the largest possible side of the subject, until the character of agricultural papers for truth and veracity is not as good as it should be. Another cause of dislike with many farmers is that they find many communications and scraps of advice more scientific than they practice or clearly understand, and in fact more than they believe pertains with any degree of profit to their business of farming. A third cause of dislike is that agricultural papers are thought to be too often subjected to the private interests of manufacturers, inventors, nurserymen and others.

Now that the removal of the above causes would bring all farmers to believe in making farming a study, or to love agricultural reading would be absurd to suppose. But these hints may be of use to agricultural papers and their correspondents, though we think there is much less need of them now than formerly. The Rural, we are glad to say, has done much to remove the prejudices against "Book Farming," and is received almost everywhere with cordiality and respect. M. Y. E.

FARMERS SHOULD READ MORE, &C.

Eds. Rural:—Why is it that so few farmers take an agricultural paper, while so large a proportion of the lovers of the *rus in urbe* take both a rural and a city paper? Is it not because farmers generally are not reading men? Physical labor, I have found, is much easier to the man who has had the luck to be trained to it, than even that little mental labor required by reading, is to him whose early school education was neglected. How often I have asked one of your farmer subscribers if he had read one of Mr. Harris' letters which went to the life of practical husbandry; when the reply was, "I have not had time to read my paper." He might as well have said, that he had not time to take his Sunday nap or eat his breakfast, and perhaps with better reason.—"Ain't it mighty hard work to read?" said the Texan to the traveler who was reading a newspaper. It is not that such men are unbelievers in rural progress, but their pride compels them to denounce as useless, that which they cannot readily comprehend. But on the other hand how much to be pitied are some men who had no early physical training; astute literary men who comprehend a subject at a glance, as it is before them, either written or in type; yet such men live and die without knowing the luxury of the true physical use and capability of their own hands. I once saw such an individual call his Irishman from the wood-shed, to come and pull up a massive pig weed he had just found in his garden. Abstemious living may save such men from dyspepsia, but if they give way to the "comforts of carnal good living," they inevitably pay the penalty of breaking God's law, which declares that man shall only live well by the sweat of his face.

Boussingault says that the maximum crop of wurzel beets in Germany, is 16½ tons; while here I can show that at least three times that weight may be grown to the acre in the dryest season, and on a clay loam. If his analysis is correct, these beets contain fifteen per cent. less water than turnips.* As they do not need a new carbonaceous soil, have no insect enemies, and yield so well in all drained azotised soils, in all seasons; why may they not do as much for American agriculture as the flat turnip has for English husbandry? S. W.

* We have determined the percentage of water in several hundred samples of turnips grown under different manurial treatment; and also in the several varieties of common turnips, Swedes and mangel wurzels, but never found any *fresh* root that contained quite 14 per cent. of dry matter; the highest being the long red mangel wurzel, 13.4. The lowest per centage of dry matter we have met with, was in a very early variety of common turnips, which were sown early, heavily manured, and produced an enormous crop. They contained only 6.7 per cent. of dry substance. Taking the mean of our analyses we should judge that mangel wurzels contain on an average, about 5 per cent. less water than common turnips; and it is not improbable that in the figures quoted from Boussingault, 15 has been printed instead of 5. Certain we are that there is no such difference in the quantity of water in these roots, as 15 per cent.—However, even with 5 per cent. more dry matter, mangel wurzels would be about 62 per cent. more nutritious than common turnips; and this is amply sufficient to sustain the argument of our correspondent.—Eds.

LABOR AND IMPROVEMENT.

We are all endowed with the noblest faculties,—moral, intellectual and social.—all of which are capable of being vastly improved by cultivation. These were not given us in vain; and as of him to whom much is given, of him much will be required, so he who does not improve and increase what is given him, is not living as he ought.

But, says one, "I must labor; I have a family to support, and can ill afford time to *study*." Mark, my friend, "there is a time for everything." True, labor is wisely ordained for us all;—it is elevating, and not to the *least* incompatible with improvement. *Knowledge* does not consist in books only; these are but one source, and he is a *poor scholar* indeed whose wisdom is in books solely.

"He cannot be a perfect man,
Not being try'd and tutored in the world."

The great source of knowledge is the *world*, —a *great free school*, open to all, and *no vacation*. Here we may study nature, men and things, just as they are. Such knowledge is truly practical, and can be acquired by all.—Mind is ever restless and active—it knows no idleness—it is ever employed. Our physical energies tire, and at last are exhausted; but the mind is immortal. Why, then, can it not be employed as well on some *elevating* theme which will improve and expand its capacities, as to waste its energies on low and grovelling objects which will ruin it?

Who is so conveniently situated to obtain this knowledge of the world, of the natural world especially, as the farmer? He is surrounded by verdant fields and groves whose color is exactly suited to his organs of vision. What chemical changes on a grand scale are going on around him! He is in the *midst* of phenomena, all of which, if investigated, will yield him pleasure, as well as being a source of improvement.

The age that regards the former as a mere tilling machine, because he cultivates the soil, and supposes he needs no *mental* refinement, because he gains his living *honorably* is fast passing away, and the dignity of his profession is beginning to be acknowledged. But the question of stopping *here* rests with himself. He alone is to elevate his profession, and the more intelligence he employs in directing his labors, the more rapid and sure will be his progress. H. S. S.

Sherburne, N. Y., 1854.

GUANO AND GOOD BARS.

An old farmer, after harvesting an extra crop of corn by the application of some of the above *new-fangled* manure, meeting with his "old fogy" neighbor one day, put on a very serious countenance, and thus accosted him:

"Well, Deacon Slowgog, I want to sell you six of my hogs. The truth is, I have no corn to feed them with, because—"

"There; I knew it would be so. I told you last spring you was a fool, expending your hard-earned money in buying humbugs, guano, and all such. The fact is, Squire, them things don't pay, and I'm glad you've found it out."

"Hold on a minute, Deacon, until I finish. The truth is, I have usually had poor corn enough to fatten my hogs, but what you call humbugs, have, this year, given me fifty bushels, of perfectly sound corn to the acre, on the same ground that last year yielded but ten of sound, and thirty of unsound; and so I thought I would sell my hogs, and buy some more humbug. Out of compassion to you, Deacon, I will sell them to you, so that you can turn your ten acres of *nubbins* to some good account."

The Deacon smelt a heretic, and I turned a short corner. He has hardly had courage to mention *guano* since.—*Am. Agriculturist.*

Agricultural Miscellany.

CORN AND HOGS IN INDIANA.

The *Indiana Farmer* thinks that after all the excitement about the drouth and its consequences, most of the crops in Indiana this season, will turn out to be full an average. The only important crop which approximates to a failure is that of Irish potatoes, which has probably suffered one-half. Of sweet potatoes the yield is unusually good, and the crop excellent. Apples are scarce. But it was in regard to Indian corn that most fear was entertained.—The *Farmer* says:

Many have been of the opinion that this all important grain would fall so very far below an average yield, that thousands of hogs that were intended to come into market this winter, could not possibly be fattened. Now we are pretty well convinced that more hogs will be cut the coming winter, than have ever come to the block in one season before, and that the quality of the pork will be but little, if any inferior to that of other years. Because, first, the corn crop is, after all, agreeably to the best information we can obtain, very little below an average one, the country over; in some parts it is a full average. Taking into account that a much greater breadth of land was planted the past season than usual, there cannot have been much less corn grown than in other years.—And, second, there is an unusual amount of mast, in some places nearly or quite enough to fatten all the hogs within reach of it. Within a short time past, we saw in an adjacent county, acorns actually sprouting and taking root under the trees, because there were not swine enough to eat them. This "crop" far exceeds, in some places, any thing we ever saw before. The hogs we saw in our recent travels were nearly all fat; most of them would already make good bacon.

Sale of Imported Poultry.—At the auction of the fine poultry on exhibition at Barnum's Museum, as noticed last week, fancy birds brought fancy prices—thus, one pair of white swans, $100; one pair Barnacle geese, $40; one pair Mandarin ducks, $150; three hoop billed ducks, $75, &c; but the more common sort sold cheap—thus 2 black Shanghai hens $3, Brahma Pootras $2,50 each, &c. It is said there was a deal less on the cost in England, on an average, of 75 per cent.

The Locust for Kansas and Nebraska.—A correspondent communicates some facts in relation to the culture and growth of the locust tree, which will be of interest to Kansas and Nebraska emigrants. He advises that locust seed be taken out in preference to plants or cuttings, because more portable and surer. He states that he has raised locust trees from the seed, and had them grow to the height of four feet the first year, and that in the cold, sterile soil of New England. To insure the vegetating of the seed, the first year, however, he says it is necessary to pour boiling water upon it, say half an hour before planting. It will not injure the seed. Except this course is pursued, the seed may lay in the ground till another year. If planted in a rich, new soil, a considerable quantity of fuel would be produced the first year.—*Tribune.*

Storing Potatoes.—The most successful mode of preserving large quantities of potatoes which we have witnessed, is to bury them in large heaps, and cover them first with straw thick enough to form a coating of *one foot* when *well packed*. A covering of earth or turf three inches thick over the straw was found amply sufficient to exclude frost; while the absorbing power of the great mass of straw prevented any injury from dampness, and the thin coating of earth admitted good ventilation.—*Country Gent.*

A Profitable Farm.—The farm of Bryan Jackson, near Wilmington, Delaware, consists of 220 acres. On this farm he employs three hands all the year, at $132 per annum each; two men extra for six months, at $12 per month, and day hands, whose wages amount to about $50 a year; making in all for labor, a cost of $600 a year. Mr. Jackson, in the American Farmer, says,—"The sales of the farm the past year will not vary much from fifty-three hundred dollars."

Pumpkins—The most effectual method of preserving pumpkins during the winter, is to select the largest and most perfectly matured, and having deposited a stratum of dry straw on a close floor, place them thereon—not so near as to touch each other, and cover them carefully with straw, on taking especial care to fill in the interstices or spaces between the pumpkins, till the receptacle is filled, or until you have laid by as large a quantity as your inclinations or necessities require.—*American Agriculturist.*

Worth Knowing if True.—It is said that a small piece of resin dipped in the water which is placed in a vessel on the stove, will add a peculiar property to the atmosphere of the room, which will give relief to persons troubled with a cough. The heat of the water is sufficient to throw off the aroma of the resin, and gives the same relief as afforded by a combustion of the resin. It is preferable to the combustion, because the evaporation is more durable. The same resin may be used for weeks.

The Crops in Georgia.—Senator Dawson writes, that "the Georgia corn crop will be sufficient for home consumption and not more. The cotton crop one-third less than the last year, fully. The potato crop almost a failure. The crop of cotton last year was an average crop."

SUNDRY HINTS FOR THE SEASON.

There is at least one very good reason why the work of the last of the autumn months should be promptly attended to. If not seasonably performed, everything will be transfixed with chains and bolts of frost, and to most of our readers, four months must elapse before emancipation can take place. In any other month, what happens to be neglected, may be done in the first few days of the next; but here, no allowance is usually given the tardy and neglectful farmer. For this reason, it may be of essential use to point out some of the closing fall-jobs.

One of the first, is to secure unharvested crops of carrots and ruta bagas. They may sometimes escape longer, but they are never positively safe beyond the first of the month. Ruta bagas being much exposed above ground should be gathered at once. If covered in heaps by earth, they will endure a slight freezing without injury, and hence may not need so thick a covering as potatoes and beets; but in the cellar, exposed to the air hard enough to touch them should be admitted. If air can easily be let in for ventilation below them and ready egress is allowed for it above, they may be piled in large masses; but without this precaution they will probably heat, rot and spoil. In out-door heaps, ventilators in the top, made by thrusting in a small bundle of brush, or even of coarse straw, are indispensable. These remarks will apply in some degree to all other roots. Heaps of potatoes are often found to contain most rotten ones at the top, which is ascribed to the supposed action of frost to this most exposed part,—when the true reason is the accumulation of foul and heated air at the highest point, where it can find no escape.

Underdraining may be performed to advantage on all soils not too wet. There are many portions of the farm that are too hard to ditch during the dryer season, that have now become sufficiently softened by the autumn rains to work advantageously. Let as much of this be done as may be practicable, and next summer's crop will tell the result.

Plowing in autumn has several advantages. It divides the labor of teams, and enables them to perform while they are strong and vigorous, and during cool weather, a part of the work which must otherwise be done in spring, often under more unfavorable circumstances. It frequently admits of earlier sowing of spring crops by a week or more,—a difference which often makes a greatly increased amount. We have known a delay of ten days to diminish the oat crop more than half, as compared with earlier sown fields. Autumn is especially adapted to the deep trench plowing performed with the Michigan plow, by the exposure which it gives to the newly turned subsoil, as well as in consequence of the increased facilities for a strong drought at this season.

Wheat fields are often much injured by snow-water standing upon the surface early in spring, in large puddles which cannot escape. Surface furrows should be well cleaned out before winter so as to admit of the ready draining of these bodies of water.

Ample preparations should be made for shelter to domestic animals during winter. Sheds, stables, sheltered yards, feeding-racks and feeding troughs, often save in a single winter their entire cost, by avoiding the needless consumption of food to impart warmth, and by preventing a waste of fodder under foot.

Cattle often suffer in winter for want of water, and prefer going without for a time to traveling a half mile for it, exposed to dogs and other annoyances. Provision, if not already made, cannot be secured after the earth is frozen up. Timely care should therefore be taken in this particular. Good milk, sweet butter, and healthy and thriving animals depend more on pure wholesome water than many suppose. Care should for this reason be taken to have clean troughs; and every night the water should be withdrawn by means of a plug, so that it need not freeze, and to admit of a clean, fresh, unfed portion the next morning.—*Country Gent.*

A California Wheat Field.—As a specimen of what can be done on the soil of California, the editor of the Sacramento Union mentions that he had seen a field of wheat of 600 acres, growing in Yolo county, part of which he thought would harvest 75 bushels to the acre, and that ten acres had been measured off and reaped. The owner thrashed and weighed it. The weight was 40,004 lbs. which at 60 lbs. to the bushel, gives 66 and ⅔ bushels of wheat to the acre, and other parts would furnish a greater yield.

Benjamin W. Cooper, an enterprising farmer of Camden, N. S., says an effectual manuring for land may be obtained for about 50 cents an acre, by paying that amount for a pound of turnip seed, and sowing it among corn. "I have reason to believe," says he, "that a crop of turnips when buried, leaf and root, will be found superior to almost any other that can be obtained, for the purpose of *plowing-in* as a green crop for manuring."

Loudon says:—"*Mule* is the hybrid produce of an ass and a mare, having a large, clumsy head, long, erect ears, a short mane, and a thin tail. *Hinny* is the hybrid produce between the she ass and a stallion; the head is long and thin, the ears are like those of a horse, the mane is short, and the tail well filled with hair. The hinny is much less common than the mule, because less handy and useful."

Some Squashes.—The *Boston Cultivator* says:—Mr. Moses Titus, of Pepperell, Mass., has sent us one of six squashes produced from one seed, the aggregate weight of which was 164 lbs. Five others of an immature state, were found on the same vine. The length of the vine was 121 feet. The name of the variety is not known to us. The specimen sent us is of a color nearly pea-green.

Cattle and domestic animals should commence the winter in good condition.

Inquiries and Answers.

Guano, Mapes' Subsoil Plow, &c.—Will you please favor a subscriber with an answer to the following inquiries:—I have a summer fallow of nine acres, sown (drilled) to wheat the 1st and 2d days of September. Soil mostly a clay-loam, with stiff, tenacious clay subsoil; plowed the first time the 1st day of June, and subsoiled with one of Mason, Nourse & Co.'s subsoil plows, with two additional surface plowings during the season. Previous condition of the field, considerably reduced, having been sown to oats and buckwheat for two or three seasons successively, with no grass seed. Just previous to the drilling of the wheat, there was sown a coating of lime, at the rate of ten bushels to the acre (slaked.) What I wish to know is, whether you would advise a top-dressing of guano, and if so, whether this fall or in the spring, and what effect the previous sowing of lime would have upon the guano, if any—as you advised in the Rural, I think last spring, not to sow the two together. Being a young farmer, will you bear with me in asking of you the appearance of guano, and its *preparation* for sowing, and what per cent. of ammonia it should be warranted to contain. Aside from the views of some of your correspondents, would you advise the sowing of clover in the fall? It is something that has never been practised here. The fall sowing of timothy is quite common, and should be universal.

You may have noticed a recommendation of Horace Brekell's, last spring, that farmers who wished to purchase subsoil plows should by all means get Mapes' new patent. Is it the same Mapes', as he of *superphosphate notoriety*? If so, with what degree of allowance should we heed it? Notwithstanding his superphosphate *humbug*, I suppose you would give his plow all the merit due it. Have any of the farmers of your acquaintance tried it?

If you will answer the above, you will very much oblige one who can better hold the plow than the pen—yet who will endeavor to profit by all the information given.—C. M. Starr. *Newfield, Sept.*, 1854.

There would be no danger of the lime, already mixed with the soil, liberating the ammonia of the guano faster than a loamy soil would retain it. On loamy soil, for wheat, we should always sow guano in the fall. Experiments have proved this to be better than sowing it in the spring. Peruvian guano varies considerably in color—from a light to a dark brown. The best sample we ever saw was pulverulent, and of a very light snuff color.—The lighter colored guanos are most popular in England, but the color of guano is really no indication of its genuineness or comparative value. These can be ascertained only by an analysis. A good Peruvian guano should be warranted to contain 16 per cent of ammonia. It needs no preparation before sowing except to break all the lumps. It should all be passed through a seive in order to be sure that the lumps are all broken. Three hundred pounds per acre is a good dressing. If wheat sells for $2 per bushel you will finds its application profitable. If for $1 you will not realize much profit.

We have never sown clover in the fall, and in this climate should prefer to sow it early in the spring.

We have seen Mapes' subsoil plow, but not at work. We should judge it to be a tolerably good implement. We trust you will get one and tell us how you like it. We should have answered earlier but your letter got mislaid.

Rain Water Cisterns.—I am about building a cistern for rain water. The soil is dry and compact. By plastering the sides of the excavation with water-lime cement will it hold water and be durable? or is it necessary to build a wall? What is the best proportion of sand to the lime.—A Reader, *Genesee Co., N. Y.*

We know of many cisterns, made by simply digging a hole *with a slope*, and plastering three or four times, which have been in use for many years, and are now as good as ever. In making be sure and not let the water get in till the cement has become hard and dry. Six parts of water-lime to one of sand is a good proportion. Course sand is said to be better than fine. The cistern should be covered, and well protected from the frost. We should much like the experience of our readers in this matter.

Door-Yard Fence.—I wish to build a door-yard fence. It should be plain, not expensive, but durable, and one that will *look well* when completed. 1st, In what *manner or style* should the fence be built? 2d, How should the posts be set to preserve them longest from decay? 3d, How should the posts be set to prevent the frost from heaving them? Will you or your correspondents answer the above questions in the Rural, and oblige—D. C. S.

Colds and Foals.—I wish to inquire, thro' the columns of the Rural, what will cure calves from coughing? and also, how to cure the foals (or rot foot) in cattle? I have tried numerous remedies without the least success.—A Subscriber, *Plymouth, Chenango Co., N. Y.*

Sheep Ticks.—Will some of the correspondents of the Rural inform me the best and quickest way to relieve Sheep from ticks?—A Subscriber, *Taberg, Oct.*, 1854.

Orchard and Garden.

HINTS AND GLEANINGS.

EXPERIMENT IN BARKING A TREE.—It has been stated that an old apple tree could be made to bear by taking a ring of bark from some of the larger limbs. A writer in the *N. E. Farmer*, tried this on a large tree in 1849—taking only a narrow ring of an inch wide, from one limb. The result was, the first year after, that limb bore fruit, whilst the rest of the tree did not; it bore three successive years, failed last year, and died this.

OYSTER SHELLS FOR FRUIT TREES.—Somebody says:—"If you have barren fruit trees, in poor soils, break up oyster shells finely, and mix them with ashes, and dig them in about the roots. Oyster shells have saline matter attached to them, with some animal matter, and much lime. The application will generally induce an immediate and decided improvement." Manure, with good cultivation, will do as well, no doubt. The real remedy is to ameliorate and enrich the soil by any means which will effect that object.

A PREMIUM ORCHARD.—The Oneida Co. Ag. Society awarded a premium of $15 to JOHN. TALCOTT, of Rome, for his orchard of 385 trees, the largest of which were planted in 1849, and are now sixteen inches in circumference. The following statement is from the report of the Society:

"The land on which Mr. Talcott's orchard is planted, is mostly a sandy or gravelly loam with a clayey subsoil. Previous to planting it was plowed in back furrows, and the holes were dug along the ridges, thirty feet apart, three feet in width, and eighteen inches deep. In each hole was put a large wheelbarrow load of compost, made of stable-manure, lime, ashes and muck, under cover the year before. In planting the trees, surface soil was placed about the roots. The orchard ground has been cultivated to hoed crops. Once a year the trees have been pruned, and washed with strong soap-suds, a woolen cloth being used for this purpose. This washing has given the stems a clean, healthy look, and has tended to keep away the insects. At the approach of winter the soil has been heaped up about a foot around the trees. This has kept away the mice."

PEAR TREES IN CALIFORNIA.—I have seen the famous pear orchards of San Jose and Santa Clara, Cal., and I can assure your readers that these trees are worth looking at—they are without a sign of disease or defect in any shape. They are planted on soil where the roots reach water during the dry season, as the soil in that valley is filled at a certain depth with running water, supplied by the mountain streams, sinking into and losing themselves in the alluvial soil at the foot of the mountain.—It will be found that all of the best specimens of pear trees in this country reach water; like the famous ones on the Detroit River, for instance; and persons in planting a pear orchard should have reference to the character of the subsoil, as a constant supply of moisture is essential to the health and prosperity of this tree. I. HILDRETH.

HINTS FOR THE SEASON.

Now that the busy time in this department is well nigh over for the present season, a good opportunity presents itself to make any needful improvements or alterations which past experience may have suggested.

The past season has been an excellent one for observing the wonderful effects of well drained, over wet or underdrained lands, and should be a lesson to those who have wet lands to at once set about draining them.

Good hard walks are another necessary adjunct to a kitchen-garden—walks that will be dry in all weathers, and sufficiently hard to bear the necessary wheeling on them. The slate rock certainly answers the best for this purpose of anything we know of in this neighborhood. It should be blasted and got in the fall, and if partially broken up and laid in heaps or on the walks themselves, will by the action of the sun and fire during winter, be nicely pulverized.

It is not an unfrequent occurrence to see kitchen gardens smothered up with fruit or other trees. This is a great evil, where a full supply of vegetables is required, as it is impossible to have top and bottom except it may be in very few instances. If it is wished to have fruit trees within this department, they should be either espalier trained or the more modern pyrimidal; at any rate they should be dwarf, and if planted to form a sort of avenue to the walks, they may be made to assume a pretty feature. But to look well in this place, they require to be kept in good order and properly trained, or they soon become too large for the place, and are often permitted to grow on until it is too late to keep them within the bounds of dwarfs, and because they bear some fruits, are allowed to remain to the great injury of the crops or vegetables.

Asparagus.—This useful culinary vegetable should, as soon as the foliage is turning yellow, be cut off close to the soil, and the beds prepared for winter. This consists in slightly forking up the soil, and spreading a coat of long manure all over the beds, three inches thick. The alleys should then be dug up and a portion of the mould from the alleys be scattered over the entire beds, which assists in keeping the manure in its place as well as making the whole look neat. In the spring the beds should receive a gentle forking and raking all over, as soon after the weather breaks as it can be worked. Some seed should be saved and cleaned, ready for sowing in the spring, to fill up vacancies or make new plantations. With good care plantations will last many years.—E. SANDERS, in *Country Gent.*

THE ONE ACRE FARM;

OR, CURE FOR HARD TIMES.

"How much land have you got here in your lot, Mr. Briggs?"

"I have one acre."

"One acre! and here you are taking four agricultural papers, and all because you have one acre of ground! How many such papers would you have to take if you had a hundred acres?"

"I shouldn't probably need any more than I take now; you know, Mr. Chapman, one can 'go through with all the motions' on one acre as well as on a hundred."

"A man can throw away money without any, if he has a mind to. For all the good you get from such periodicals, you might as well, probably, throw the money they cost into the fire; they are nothing but humbugs."

"I pay in all, only eight dollars."

"Eight dollars! enough to buy a 'tip-top' barrel of flour, and a leg of bacon; and then if you read these periodicals, there is twice the amount of the money spent in time reading them."

"I do usually read or hear read, almost every word there is in them; my boys and I take turns in reading, and one reads aloud while the rest work."

"Complete nonsense! no wonder your shop don't turn out any more boots in a day, than it does!"

"Perhaps we don't do as great days' works, some days, as some of our neighbors, but I guess that in the course of the year, we turn out as many according to the hands at work, as most do."

"I suppose it is out of these publications you get your foolish notions about so many kinds of fruit trees. One of my boys came home a while ago, and said Mr. Briggs had got lots and lots of fruit trees and such things, that cost, I don't know how much, and wanted me to buy some grape vines, pear trees, and so on. I told him it was all foolishness and not to let me hear him say anything about spending money so foolishly. You have, I dare say, laid out ten or fifteen dollars, this spring."

"Yes, nearly as much again; I have laid out twenty-five dollars for trees and garden fruits."

"Twenty-five dollars! I wonder you are not on the town, or in jail at least, before now."

"I'm not afraid of either; I'll bet you the twenty-five dollars, I'll sell you that amount of fruit from those things for which I paid the twenty-five dollars, in five years!"

"Done! I'll stand you; so your trees will cost you fifty dollars sure, in money, besides the time thrown away in setting them out and taking care of them."

"As for the time spent in setting them out, or taking care of them, it is as good exercise as playing ball, wicket, or anything else.—While we were setting them out, one of your boys came to get my boys to go over to Mr. Moody's, where he said was to be a great time playing ball; and I have no doubt, your boys spend just as much time playing, as mine do with our trees and so forth; and then something is done, but in playing, the strength is all laid out for nothing."

"Well, it don't cost anything to play ball, but trees cost money."

The foregoing conversation occurred in the shop between two neighbors, both boot-makers, in a town not more than thirty miles from Boston.

Mr. Briggs, in whose shop the conversation took place, was a man of more than ordinary intelligence for one of his advantages and circumstances in life. He had been a poor boy, and by industry, observation and economy, had worked his way on in life and reared and well educated a family of children, who, like himself, were industrious and steady. For the few years past, he had become interested in horticulture, and both for exercise and amusement, had turned his attention to cultivating his "one acre farm." His attention was first called to this, by means of a "back number" of the *New England Farmer* which was put round some things bought at the store. Mr. Briggs found this so interesting, that he purchased another at the periodical depot, and then he became a "regular subscriber." His sons soon became interested in the same direction, and the interest of the father and sons increased to the pitch indicated in the foregoing conversation.

In time, every inch of that acre of ground was "brought under the spade," and almost every "best" variety of fruit had a place there, and the father and sons found pleasure and profit in the garden after being cooped up in the shop till the "strut" was done, and the exercise was far more profitable than the spasmodic, violent exercise taken in games.

Mr. Chapman, the other neighbor, was a man of the "common stamp." He looked upon everything new or uncommon as "folly" and "nonsense," and was ready to sneer at every one who stepped aside from the common track. It looked simply silly to him, to see a man stay at home from "muster," or "training" or "shows," and spend his time in cultivating a garden; or, instead of loitering away the evening at the store, smoking, and hearing or telling a deal of nothing or worse, to spend the evenings at home, reading such "nonsense" as the *Farmer* and *Horticulturist* affords.

Years pass and Mr. Briggs' "one acre farm" shows that he and his boys have not read "the papers" in vain. They had learned how to "set out" a tree, and how to "take care" of it after it was set out. Everything showed it received the right kind of food and care, and straightway began to bring forth fruits meet for good cultivation. In a short time the wants of the family were more than supplied, and the surplus found a ready market with the neighbors at good prices.

Those early apples so rich and tempting, when all other apples were so green and hard! and then such pears; they went as fast as the son and house could ripen them, at three, four, or five cents apiece. Then such clusters of rich, ripe grapes—too tempting for the coldest to pass without a watering mouth. Mr. Chapman's family were among the best customers for the tempting fruit—first having learned their excellence by the liberality of Mr. Briggs, who never failed to send a specimen of his best to his neighbor.

The fifth season came. It was a fruitful year. Apple, pear, peach, plum, and all other trees, were loaded with fruit. Keeping in mind his conversation with Mr. Chapman, Mr. Briggs had directed his family to set down every cent's worth of fruit sold to Mr. Chapman or his family. This year, as it happened, was a year of "extreme hard times." The boot business was at its lowest ebb; little work and very low wages—and yet the prices of every kind of provision up to the "highest notch," and money extremely "tight."

But there was one family that did not seem to be in the least affected by the hard times, low prices of labor, high prices of provisions, or the scarcity of money; Mr. Briggs and his two oldest sons, all of them had a little "spare change" to let on short time "with interest" to their needy neighbors.

One day Mr. Chapman, who was short, applied to Mr. Briggs for a "half" for a "quarter," meaning fifty dollars for three months.

"Yes," said Mr. Briggs, "I have a 'half' or a 'whole,' just as you like."

"What, a hundred dollars by you these times! I don't see how it comes. You and your boys don't work any harder than I and my boys do, and we can hardly get along; we are as saving and pinching as can be, too; times are so dreadful hard, and everything a family has to buy is so dreadful high, and wages so low; potatoes, a dollar a bushel, beef, fifteen cents a pound, pork sixteen cents, eggs, twenty-five cents a dozen, and flour, ten or twelve dollars a barrel! How can a man live?"

"It won't be hardly fair for me to ask you for that twenty-five dollars, now, will it?"

"Twenty-five dollars! What do you mean? I don't understand you!"

"Don't you recollect we have a bet between us about the price of some fruit trees I bought five years ago next spring?"

"Ah, I do remember something about it.—You were to give me twenty-five dollars if you didn't get your twenty-five dollars back from me for the products of those trees and things! It will come very handy just now."

"Don't be too fast, neighbor! I am afraid it won't 'come very handy just now.' That was what I was dunning you for, that twenty-five dollars!"

"What! you don't pretend to say we have had twenty-five dollars worth of stuff from your garden."

"More than that from that very twenty-five dollars' worth of trees and other things! Here is an account of everything you have bought and paid for; of course, it don't include what I have sent you, gratis."

"And you have certainly not been stingy.—Why, this bill amounts to thirty-seven dollars! it is not possible!"

"It is just so; you have had over twenty bushels of apples, and three bushels of pears, and those alone come to twenty-five dollars."

"I own up the 'corn;' draw the note for seventy-five."

"No, I guess we will let that twenty-five go. I only mention it to show you that there may be good sense in new things, sometimes. Now I will bet the twenty-five dollars over again, that my store-bill has not been, the past season, half as large as yours, though I have had one the more in my family."

"If I had not been so badly taken in before, I would stand you; but I guess it wont be safe."

"We have raised our own potatoes, corn, peas, beans, and all other garden vegetables.—Our eggs are always fresh and in abundance from the nest; and for more than two years we have not been without ripe fresh fruit."

"How can that be?"

"Well, I declare, that is something I never thought of; but it takes so much time and bother to get these things started—then it is an everlasting job to take care of them."

"It needs no more time and money than you throw away on things that amount to nothing at all, and with abundance of fruit, you save the expense of a heavy meat bill, which is not healthy in hot weather. No doctor has been called to step foot into my door for over four years past! Fresh, ripe fruits are sure remedies for all ailments, and they are not hard to take."

Mr. Chapman put the "fifty" into his "wenzel-skin," and left with a "flea in his ear."—A. B. B., *in New England Farmer.*

MASSACHUSETTS HORTICULTURAL SOCIETY.—At an adjourned meeting of the society, E. S. Rand, Esq., the Chairman of the Committee appointed for that object, offered a preamble and resolution, the former denying the statements made by the Select Committee, May 26th last, and the latter *rescinding* the same from the records, together with the vote of censure passed on Mr. C. M. Hovey at the same meeting. The meeting was one of the largest ever held at the rooms, and the vote unanimous.

We congratulate the Society upon the settlement of this question, and its award of justice, both to its Fruit Committee and the gentleman above named.—*Boston Transcript.*

PROFITS OF SHADE TREES.—Let a farmer plant out by the roadside 100 trees, at a cost of $50, (and this is a liberal estimate;) in ten years' time that farm will sell for $500 more than it would without them; and I venture the assertion, the owner would not have them removed for that sum.

THE OHIO STATE POMOLOGICAL SOCIETY, will hold its next meeting at Columbus, on Tuesday, December 5th.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending Oct. 24, 1854.

Henry F. Baker, of Centreville, Ind., for improvement in plows.

Mark S. Bassett, Wilmington, Del., improvement in sifting and bolting.

John D. Bedwell, Ubricksville, Ohio, improvement in sawing machines.

Archibald Bowen, Wallesville, Va., improvement in straw and grain separators.

Robert Buyack, Poughkeepsie, improvement in machinery for softening hemp and flax.

Samuel W. Brown, Lowell, improvement in machinery for cleaning cotton.

Patrick S. Devlan, Reading, improvement in chairs for round rails.

George L. Dulaney, Long Meadow, Va., improvement in mill bushes.

Absalom B. Earle, Franklin, N. H., improvement in seed planters.

Ebenezer Furil, Spring Cottage, Miss., improvement in granaries.

Julius Herriet, New York, improvement in gutta percha stereotype composition.

Joseph Johnson, Wilmington, Del., improvement in bran dusters.

Robert H. Jenks, Bridesburgh, Pa., improvement in looms.

John G. McNair, West Farms, improvement in manufacturing carpets and rugs.

Gislav Friederich Palmie and Amion Herrman Palmie, Berlin, Prussia, improvement in fire-arms.

Myer Phineas, New York, for improved pen holder.

Edward L. Perkins, Roxbury, Mass., improvement in machinery for polishing paper.

James Remon, Cleveland, improvement in making wrought iron direct from the ore.

John H. Ranch, New York, improved sliding pen and pencil case.

John Richardson, New York, improvement in pen and pencil cases.

Josiah Shanklin, Parkersburgh, Va., improvement in square, scale, level and bevel.

Benj. Sherwood, New York, improvements in safes.

Emile Sirret, Buffalo, improvement in fastening lamp to lanterns.

Oron W. Wade, Versailles, N. Y., improvement in stoves.

Wm. Warwick, Birmingham, Pa., improvement in mills.

Benj. H. Wright, Rome, improvement in rotary steam engines.

Walter Bryant, Boston, Mass., assignor to J. B. Kelsey, of same place, improved air heating furnace.

Wm. Campbell, West Philadelphia, assignor to himself and E. W. Shippen, Philadelphia, improvement in bearings for loose pulleys.

Wm. Porter, Williamsburgh, N. Y., assignor to Joseph N. Howe, Boston, improvement in securing lamps to lanterns.

Mark R. Pearson, Georgetown, Mass., assignor to himself and Samuel Shaw, Wareham, Mass., improvement in roller catch for self-acting mule.

PACIFIC MILL AT LAWRENCE—THE LARGEST IN THE WORLD!—The largest and most comprehensive mill in the world is the Pacific, at Lawrence. It makes none but the finest kinds of goods, and the success of its operation is looked to with great interest by manufacturers. The floor surface is *sixteen acres*—the largest mill in England is eleven and a half acres. There is now in operation 40,000 cotton spindles and 10,000 worsted spindles; and these are to be increased to 60,000 and 20,000 respectively. There are 1,200 looms in operation, to be increased to 2,400. These, with 2,000 hand, produce 300,000 pieces of cloth per annum. The weekly consumption of cotton is 20,000 lbs., say 1,040,000 lbs. per annum, and 500,000 lbs. wool. Once a month two thousand hands assemble at the cashier's office, where Mr. Clapp pays out $50,000 to them for wages, appropriating to each one the exact amount they have earned.—*Alb. Tran.*

TANNING COTTON AND LINEN.—English and French fishermen have been long in the habit of tanning their sails, etc., in bark liquors to render them more durable. Millet states that pieces of linen, treated for 72 hours with an oak bark liquor, at 150 degrees, and stretched on frames, remained unaltered in a damp cellar for ten years; while notanneil, in the same place and for the same time, had entirely rotted. It was further shown that linen, which had begun to moulder, might be preserved from further change by being tanned. It seems to be only necessary that the articles should be kept two or three days in a warm solution of tannin. Awnings may be treated in this manner with either oak bark or sumac—both will answer. This will afford a useful hint to our sail cloth manufacturers.

HUSK BEDS.—No one who has not tried them, knows the value of husk beds. Straw and mattresses would be entirely done away with, if husk beds were once tried. They are not only more pliable than mattresses, but more durable. The first cost is trifling; to have husks nice and clean they may be split after the manner of splitting straw for braiding.—The finer they are split the softer will be the bed, although they are not likely to last as long as when they are put in whole. Three barrels full, well stowed in, will fill a good sized tick, that is, after they have been split. The bed will always be light, the husks do not become matted down like feathers, and they are certainly more healthy to sleep on.—*Ex.*

ADULTERATION OF LIQUORS.—As a proof of the extensive adulteration of liquors in this country, the New York Sun says that more port wine is drunk in the United States in one year than passes through the Custom-House in ten—that more champagne is consumed in America alone than the whole champagne district produces—that cognac brandy costs four times as much in France as it is retailed for in our grog-shops—and that the failure of the whole grape crop in Madeira produced no apparent diminution in quantity or increase in the price of wine.

SCIENCE FOR THE MILLION.

THERE is a man who sometimes stands in Leicester Square, (London,) who sold microscopes at a penny each. They are made of a common pill-box; the bottom taken out, and a piece of window glass substituted. A small eye-hole is bored in the lid, and thereon is placed the lens, the whole apparatus being painted black. * * * I bought several of these microscopes, determined to find out how all this could be done for a penny. An eminent microscopist examined them, and found that the magnifying power was twenty diameters. The cost of a lens made of glass, of such a power, would be from three to four shillings. How, then, could the whole apparatus be made for a single penny? A penknife revealed the mystery. The pill-box was cut in two, and then it appeared that the lens was made of Canada Balsam, a transparent gum. The balsam had been heated, and carefully dropped into the eye of the pill-box. It then assumed the proper size, shape, transparency, and polish of a very well ground glass lens. Our ingenious lens-maker informed me that he had been selling these microscopes for fifteen years, and that he and his family conjointly make them. One child cut out the pill-boxes, another the gap, another puts them together, his wife painted the black, and he made the lenses. —*Letters from Abroad.*

DR. NEWTON'S NEWLY INVENTED GUN.—We were shown, the other day, a newly improved gun, which, we believe, will eventually supersede those now in use. It was invented by A. N. Newton, of Richmond, Indiana, and is called the "Breech-loading Fire-arm," and was patented last June. It can be loaded and fired from twenty to thirty times a minute. The charge is placed in the gun at the breech, and although perfect to accomplish the purpose, the invention is very simple, and in its simplicity lies one of its chief merits. By the motion of a spring, a small cover at the breech of the gun slides back, leaving room to put in the charge, and by a reverse motion the cover is pushed back again and the charge is forced into the barrel. It is perfectly safe. We think it vastly superior to the revolver. The charge is made into a cartridge before it is applied to the barrel. The principle of the invention is applicable to any gun.—*Cin. Gaz.*

INCORRUPTIBLE RAILROAD TIMBER.—If we may believe the New Orleans *Delta* of the 14th, sleepers on railways, that is, wooden ones, may rest undisturbed for a long period as indefinite as the repose of the fossil. A preparation has been invented for preserving submerged timber, consisting of asphaltum, sulphur and arsenic. It is applied like paint, when the wood is dry. A marine railway in California, to which it was applied, remains perfectly sound; while the timber of the same species by its side has twice required removal. Mr. Swan, of Shoal Water Bay is the inventor.

Domestic Economy.

TO MAKE CORN STARCH.—The ripe grain must be washed and ground to a fine meal, and then placed in a glazed mortar, and rubbed and triturated with a small quantity of water, until all the farinaceous particles are broken down. It is then to be transferred to a fine linen filter, washed, and expressed with successive portions of water. The liquid that passes through, must be allowed to stand for sixteen or twenty hours, for the sediment of starch to subside. The water is then to be drawn off and the residue dried in the usual manner.

This is the simplest and cheapest mode yet known for preparing the corn starch for puddings and other useful applications.—*Albany Cultivator.*

NEW PROCESS OF MAKING BREAD.—A new mode of making bread for the use of ships, so that it can be preserved indefinitely, has been discovered by M. Laverne, a French baker of this city. We have seen rolls made by M. Laverne that were perfectly good after having been kept a month.—*N. Y. Tribune.*

GREASE FOR COARSE BOOTS.—Take a coal made of white pine, of the size of a hen's egg, well burnt, pulverize it finely, mix it with enough of clean melted tallow to make it of the consistence of thick paste. Two or three applications will make the leather soft, and will keep the water out.

TO MAKE PRIME VINEGAR.—A correspondent of the Ohio Cultivator vouches for the merit of the following recipe for making vinegar: Take and mix one quart of molasses, three gallons of rain water, and one pint of yeast. Let it ferment and stand for four weeks, and you will have the best of vinegar.

BAKED EGGS.—Put half an ounce of butter into a small tin pan; break four eggs in it, keeping the yolks whole, throw a little pepper and bits of butter and salt over; put in the oven; or before the fire, till set, and serve.—They will take about six minutes doing.

FRECKLE WASH.—Half an ounce of borax, dissolved in water, with a little cologne added to render it pleasant, forms an excellent wash for the removal of eruptions on the skin, of various kinds, as well as freckles.

FINE BLACKING FOR DRESS SHOES.—Beat up two eggs, add a tea-spoonful of alcohol, a lump of sugar, and ivory black to thicken; it should be laid on and polished like other blacking and left a day to harden before it is used.

TO MAKE BOOTS WATER-PROOF.—Melt 3 oz., each of rosin and beeswax, and stir in 1 pint of boiled oil and heat all well together; when partly cool, add 3 oz. of turpentine.—Apply hot with a brush.

Educational.

SCHOOL BOY PROMISE.

A SKETCH BY A MAN OF FIFTY.

Theodore S. Fay, in narrating his early adventures in the capacity of pedagogue, gives the following as his experience of youthful indications of future greatness:

Thirty years ago I was penniless and without a friend. I had engaged unsuccessfully in two or three forlorn speculations, in the course of which I wandered about the State with a reckless independence, sometimes mourning over the past, and sometimes anticipating the black and gloomy future. At length my funds and every invention to increase them were exhausted, and shunning all society, I spent a week in devising plans by which I was to be rescued from my embarrassments. I wrote to a friend, who was the proprietor of an academy of some renown, and offered my services as an assistant. They were kindly accepted. His answer enclosed advance money to a considerable amount; and in a few days, as I were but the image of some changing dream, I found myself away from the wide green hills and shadowy wood of the country, pent up in a small room with a class of boys whom I was to initiate into the mysteries of geography and astronomy.

The first lad was a dull, singular-looking being, of the most unpromising exterior. Judging from appearances, the probability of teaching his "yoong iden how to shoot," seemed a matter of considerable doubt. I strove several times for a glimpse of intelligence in his mind in vain. It was like the labor of the Brazilian slave, digging in the sand for diamonds.

"Where is Asia?" asked I.

He reddened, put out his under lip, cast down his eyes, and at length found words to say,

"On the map, sir."

"Point to its *real* situation."

He stuck out his clumsy hand like the forepaw of a dancing bear, and pointed in a direction about twenty degrees above the horizon.

"What causes the day?"

"The sun, sir."

"What causes the night?"

"The moon, sir."

I was quite satisfied as to the extent of his abilities, and passed on.

The next was a clear complexioned, noble looking fellow, with large dark eyes and glossy hair, curled about his high temples; his full lip was red like a girl's, and his voice sweet as music. He had a correct knowledge of what he had gone over, and a facility in learning whatever was placed before him. The few simple interrogations which I put to him were easily replied to, till at length he missed several in succession. Then came a shadow over his morning face, and the tears stole up softly into his eyes, and hung upon their long lashes trembling. I could not but wonder to myself if he had a sister or a cousin who resembled him; but what was that to me? So I went on.

The next had nothing to distinguish him from boys in general. His countenance was one of those common faces which we never notice. He had pins stuck in the sleeve of his coat, and twine hanging out of the corners of his pocket; his stockings hanging and slipped down over his shoes, and the strings trailed along the floor. He fidgetted with his buttonhole, and put his foot in his lap, and at length got one of his companions laughing at something he had in his hand. I called him to me and he thrust it into his pocket, which stood out from his body as if it contained the whole amount of his personal estate. I desired him to empty it upon the desk, and forth came a medley of school-boy treasures; isinglass, slate-pencils, a ball, chewed India rubber, paper boats, a top, and among the rest, a fly-box, containing a most unfortunate prisoner, who, without judge or jury, had been summarily condemned—his wings stripped from his back, and hanged by a hair rope on an appropriate pine-wood gallows, which my friend had manufactured for the occasion.

The other was an awkward, lubberly, overgrown creature, with a pair of green eyes, that looked like a cat's. His hair stuck upstraight on every side like a coal-brush; he had a huge nose that occupied a third of his face, and he spoke with a cracked voice that had as little melody in it as the filing of a saw. He sat upon the bench with as little animation, as if he had been made out of putty; and though he did not answer any question, yet he exhibited no other sign of grief than might have been detected in a yawn that opened a mouth of most appalling dimensions.

Now, mark the caprices of fortune. Thirty years have gone with the wind. I have taken an interest in watching the progress of my little class. The last mentioned grew up into a poet. He has written some of the most delightful stanzas I ever read. They breathe a soul of the highest nature, and a heart stored with all that ennobles and sweetens life. The dunce whom I first examined, at this instant holds an office in the service of the United States, where his knowledge of human nature, and his powerful talents, have made his name familiar to every ear, as his praises will be to future generations. He in whom I found nothing to distinguish him from common boys but his slovenly appearance, is now one of the wealthiest and wealthiest merchants in the city, and universally beloved for his intelligence and virtue; and the other, whose sweet face and brilliant mind won my affections immediately and awakened the liveliest hopes of his future eminence, sleeps in the grave.

The twenty-six letters of the Alphabet and the nine digits, altogether form a key by which the infinite treasure house of science is thrown open to the free entrance of every son and daughter of Adam.

TAKE CARE.

"There, I never did see such a—you good for nothing hateful boy; I believe you are the greatest plague—"

"Take care, take care, madam; what has the little fellow done? take care not to disproportion the reproof of the offence!"

"Done? why he has done nothing but torment me all day. He waked me up with his noise before daylight, and what with his jumpings, and screamings, and scratchings, there was no peace till he was up and dressed. And then I couldn't enjoy my breakfast in peace because his mouth must be kept full, or there was a sad noise for an aching head; and then, since breakfast, he has been doing nothing else but rattle round in all conceivable mischief—He has overset my work basket, and tangled my skeins, and unwound my spools, and lost my needles, and dropped my scissors down the register, and thrown my thimble out of the window, and tipped over nearly all of the chairs and torn every book he could lay hold of, and—there, I don't mean to be cross with my baby, but I do believe he's the meanest child that ever did live, and—and I know I never was made to be a mother, and have the care of children. I haven't any tact or patience equal to it. I don't know how these pattern mothers do it, but I can't."

That was the rollopy of our overhearing that took place the other day in the presence of a great fat-faced, hearty restless-looking little fellow, who had provoked the same by his locomotive and upsettive tendencies.

Poor mother, thought we, you haven't learned the genuine secret of managing children yet. Your little boy *must be active every moment*. If he did not perpetually do something to exercise those little muscles, and develop that healthy frame, he would die. Don't scold at him, and try to keep him still, but avoid the inconvenience which arises from his misplaced activity, by keeping him active in the right place. The great recipe that never fails for taking care of children pleasantly comprises kindness in the voice, patience in the heart, and ingenuity in the intellect to contrive methods of perpetual activity. If you put your child into a room full of all ordinary matters, and do not give him an abundant supply of matters which are *his*, you need no more marvel that he should be mischievously busy in touching what he ought not, than that he should eat what he ought not when he is starving and you put him where he can get hold of only improper viands.

Children have vast imaginations. It's astonishing how easy a dilapidated broomstick becomes a horse, and any little bunch of rags a doll, and how much comfort can be taken by the little folk from a full supply of playthings of very humble mechanical or artistic pretensions. But *something* children must have. If they cannot fill their hands honestly, if there is not a plentitude of "traps" which are distinctly theirs, they will, as a matter of course, foray among the miscellanies of their adult relatives and friends; and scissors and thimbles, and spools and books will suffer accordingly.

Mothers must not be too much distressed at having the nursery floor "littered up."—Better keep a cart-load of playthings in general circulation over the carpet, than to be under the necessity of getting bad-tempered and showing it to the short boys and girls with long memories.

We know a boy who was made permanently crusty by his mother's insane horror of anything loose about the room. Nature would have its way, and as the little fellow could not satisfy nature in the ordinary methods, he took to contrivances which were stigmatized as unaccountable and intolerably mischievous, and was scolded accordingly, until the sweet milk of his disposition gradually curdled under the influence of a chronic thunder-storm of fulminated exhortations to "keep things to rights." Things were kept so ferociously "to rights" that the thing of most import, the little immortal mind, was shaped irresistably to wrong.

Plenty of patience and plenty of playthings is, after all, the great motto for the nursery.

MAPS AND GLOBES.

Many fathers and mothers can readily recall to mind the time when they studied geography without the aid of a *map* to give an idea of the shape of the different countries on the earth, the relative position of places, direction of rivers, extent and form of lakes, or the manner of distribution of land and water on the surface of the earth. Tell your child that Connecticut River rises in the Connecticut Lake in New Hampshire, runs southerly and empties into Long Island Sound, what idea would be conveyed to his mind, and how long would he remember your description without the help of the eye to aid him in conceiving of the position of that lake in the northern part of the State; in giving him a correct idea of the shape and extent of the State itself, and the situation of Long Island Sound? But it needs little argument to prove the utility of maps in the study of geography. And yet maps themselves are liable to convey wrong impressions sometimes. A pupil with a map of the world spread before him, representing within two circles the two hemispheres, was asked by his teacher what the earth most resembled, expecting of course the common answer, a globe or ball; the lad, supposing the map gave a fair representation, answered very readily, "*a pair of spectacles;*" valuable, therefore, as the map is, the necessity of a globe to convey a more correct conception is obvious. With the globe a multitude of interesting facts can be made perfectly clear to the mind of the pupil, which it is impossible to convey without it.—*Com. School Journal.*

According to the latest returns, the average of the salaries of elementary schoolmasters in Great Britain does not exceed $250 or $300 a year. The *London Critic* asks, "Can we wonder that men of mind and integrity do not prefer vegetating on such a pittance?"

STONE-WARE MAKING.—THE PUG MILLS.

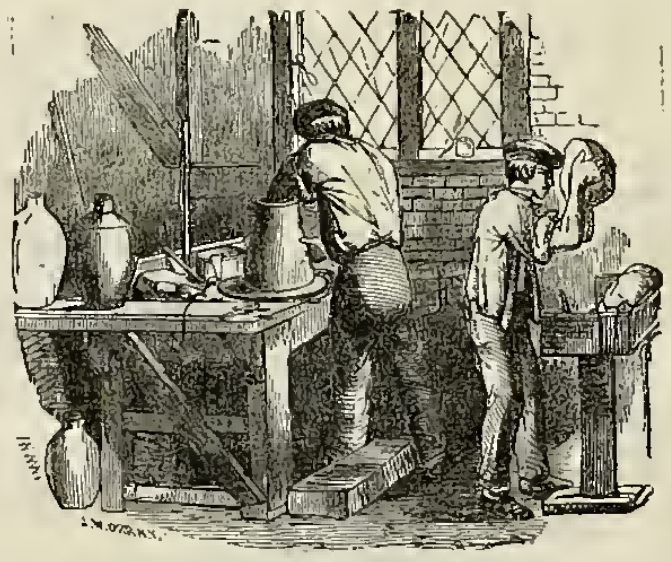
MANUFACTURE OF POTTERY.

[Continued from Page 344.]

Two weeks ago we gave an illustration of the first grinding process to which the clay was subjected in the manufacture of Stone Ware. After that operation, the material is passed through a second mill as represented in the first of the accompanying figures. The mill consists of an upright shaft inside a tub, the concave surface of which is set with knives extending nearly to the centre, and placed spirally like the thread of a screw. Knives also radiate from the shaft in such a manner, as to cross the former like the blades of a pair of shears. By revolving the shaft the clay is cut and mixed in the machine, gradually passing downward until it finally falls out at the bottom of the mill.

The clay is then ready for the turner, who breaks it up into balls of the proper size for any particular article of ware he desires to make; jugs, pots, pans, jars, bottles, or the thousand other articles so necessary in household economy. The assistant then heats these balls of clay upon a form in the manner represented in the second cut, until thoroughly incorporated, and the enclosed air driven off.

It is not necessary to explain minutely a potter's wheel. Every school-boy has seen one, or if he have so little curiosity as to have passed unheeded by, any description by us will be passed by also. The cut illustrates it. an upright shaft in a frame, the upper end of which shaft is terminated by a disk on which the lump of clay is stuck. The turner then commences revolving the wheel by means of his foot, while with his hand he expands the plastic material into any desirable form. It is a simple but beautiful process, and the writer when a boy has sat for hours within the low shed of a Brown Earthen Ware manufacturer watching the skillful manipulations of the man at the wheel.



STONE-WARE MAKING.—THE POTTER'S WHEEL.

COFFEE AT MOCHA.

The coffee plant grows sixteen or eighteen feet high, with an upright stem covered with a light brown bark. Its branches grow horizontally and opposite, crossing each other, and form a pyramidical appearance. The leaves grow on the opposite side of the branches, to the length of four or five inches, and to half that width in the middle. The flowers growing in bunches at the junction of the leaves, are white, maturing first into green, then red berries resembling bunches of cherries, each of which contains two kernels. But one crop is annually produced, which is gathered in the months of January and February. For the purpose of being dried in the sun, the gathered coffee is spread on the house top-, or cleared spaces of ground, where it is frequently watered to open the koke, or shell, which is always separated by grinding before packing. The coffee raised at Aunas and Suna, which is held in the best estimation, is generally dried upon temporary floors covered with a *compost of clay and cow ordure, which protects the coffee from vermin, and also gives it a permanent yellowish color.* How perceptibly such a compost may affect the taste of the coffee would doubtless be a matter of inquiry with the tidy, cow-loving Hindu house-wife, who uses a solution of it to purify her parlors, ornament her walls and doorways, and for numerous other purposes.

Large quantities of coffee arrive at Mocha, from March to the latter part of July, from the coffee districts within twenty days journey.—Camels are employed in its transportation, each of which carries about six hundred pounds, contained in two sacks. They are driven in long trains of fifty or more, arranged one behind another, the head of each being tied to the tail of the camel immediately before him. When thus arranged, but few drivers are necessary.

All coffee from the country is first taken to the custom house, a large building one hundred and fifty feet square, near the sea gate, where it is stored to be inspected by the governor, who visits the custom house daily.—Here, also, the duties are fixed, at the rate of seven per cent. on English, and three per cent. on American imports. A double duty is imposed on smuggled goods. From the custom house the coffee is taken to the gow-downs or warehouses of the merchants, several of which are attached to the walls of the custom house and rented by the government. There it undergoes the process of being cleared from pebbles and dirt by means of sieves. Those who do this tedious work of garbling, though expert in their calling, earn but the value of five or six cents daily, a portion of which earnings it paid to one of their number who acts as their overseer, and to whom the purchaser looks complain if he has any fault to find. An active man may garble two or three bales in a day, and a smart woman half as much. Having been cleaned, the coffee is packed in bags for exportation, and if good should be free from white and black kernels, and have an aromatic smell.

But few Arabs, and those the wealthier classes, indulge as a general habit in the luxury of coffee. It has often been disputed whether coffee does not come under the prohibition of the Koran, which forbids the use of strong and inebriating liquor, as it is a well-known fact that the fumes of coffee have some effect on the imagination. Its use is, however, generally tolerated, and many Arabs say "a dish of coffee and a pipe of tobacco are a complete entertainment." They drink it without either milk or sugar, after it has been pounded fine in a mortar and then steeped. All classes use a very palatable beverage made from the koke, or coffee shell, which goes by the name of *kauha*. It can be obtained at any of the numerous and much frequented coffee shops, where

"Well seasoned tattle the gossip's spirits raise,"

for half a cent a quart.—*Notes on Mujung and Zanzibar.*

Sizes of Shoes.—The Lynn Directory for 1851 says a *size* is the length of one "barley corn," or one-third of an inch. A size stick is thus formed: Take a rule or piece of pine wood thirteen inches in length, and divide it into thirty-nine equal parts of one-third of an inch each. The first thirteen are left blank, and counted nothing. The second thirteen are called children's sizes. The third thirteen are called men's and women's sizes; each marked from one to thirteen. Thus nine inches is a man's size, No. 1; ten inches is No. 4; eleven inches No. 7; twelve inches No. 10.

He that is of a teachable temper, will submit to the rules of the Gospel in their plain obvious sense; and he that will not do so, will run into endless errors, even as much as if the Gospel had never been preached.

Sunday Reading.

(Written for Moore's Rural New-Yorker.)

PASSING AWAY!

"*The fashion of this world passeth away.*"

This beautiful earth is all radiant with light—
Decked in Spring's brightest garb it glad'ned our sight;
The flower-clad hill-side, the sparkling rill—
The mild breath of evening so quiet and still—
The genial sunlight, the rainbow-hued shower
In beauty descends on field, tree and flower;
Yet not long the fair scene around us may play,
Earth's beauty and fashion soon passes away.

Do bright skies beam o'er thee in life's joyous Spring?
Doth thy free spirit soar on fancy's gay wing?
Doth Friendship around thee her pure light throw,
And love fondly whisper in cadences low?
Are the world's wealth and honors upon thee bestowed
And its smiles lavished freely on life's sunny road?
Mayst trust not in these—short, short is their stay,
The fashion of this world soon passes away.

Or perchance clouds and tempests thy pathway may shroud
And the deep waves of sorrow beat fiercely and loud,
Thy life's early friends may pass at the ford,
Rending sweet ties of youth no years may renew;
The heart's dearest memories may rest with the dead—
O'er hopes crushed and vain the soul's tears be shed.
But not long may o'en grief o'er thy spirit hold sway—
The fashion of this world soon passes away.

Change, change is recorded on all things below
The cloud and the sunshine, the lofty and low;
The brightest and fairest soon fade from our sight,
And morning hours follow the dreariest night;
The bright dreams of youth and glad hopes of the heart
Enchant for a moment, then quickly depart:
Life itself is a vapor in the sunbeam's bright ray,
"It appeareth a moment then passeth away."

There is a bright world where change never comes,
Where the weary and careworn no longer may roam
Where beauty and bliss never more shall depart,
Nor sorrow and anguish press sore on the heart,
While shrouded in gloom, on time's changeful shore,
Where cold storms and tempests around us may pour,
The light of that world shall shine be our stay—
Heaven's glory and brightness that pass not away.

Sparta, N. Y., 1851. Amanda.

MISERS OF MINUTES.

"Take care of the pence, and the pounds will take care of themselves," is the secret of growing rich. And in the time-currency, moments are the gold-dilings—the precious atoms that, saved or lost, make or unmake a life.—No man can afford to lose his minutes. The miracles of success that have been wrought in the lives of certain men have been achieved through economy of time, as close as Thomas Elwes's economy of farthings. Elihu Burritt, the learned blacksmith, once said that he had acquired some knowledge of fifty languages during the intervals of his labors at the anvil! He treasured his minutes, as his only earthly "fortune." Dr. Mason Good, the learned English author, composed his translation of a Latin book in the *streets of London* during his extensive walks and rides to visit his numerous patients. His practice was to take in his pockets two or three leaves of the original. He read this passage over as he walked along until he had engraved it on his retentive memory. Then he translated the passage in his mind, corrected it, and when he reached home committed the translation to paper. He thus finished the work without omitting a single professional visit! Richard Baxter, who wrote more discourses and books, and visited more frequently his parishioners than any clergyman of that century, (thereby affording a rebuke and an example to many ministers of our day,) was a miser of minutes. His good example was contagious among his flock. He taught the Kidderminster weavers to fasten religious books on their looms, and study their contents while they were throwing the shuttle.

He that loses his minutes, loses his life—too often loses his soul. For we never *have* any thing but the present moment. The past is gone—the future is not ours. And the sea captain who should sit and heave out his cargo by the single package would come into port at last with about the same character for sagacity as the spendthrift of time comes to the death-bed that ends his life-voyage. It is a total loss and an insurance.

It would be both ruinous and sad for us to cast up a strict inventory of our wasted moments in a single day. The time lost in the morning in debating with ourselves whether we shall get up or not—(instead of following the example of systematic John Wesley, who, when he was tempted to loiter in bed, was overheard to call out, "Well, John Wesley! *you* may do as you like, but *I* mean to get up")—the time lost in indecision as to the day's work, in making long talks or long visits when shorter ones would achieve more, in idle reveries, in trifling awhile *between* each separate engagement—the aggregate of each day's loss from such causes would be startling. Added together, they might occupy longer time than it took Milton to write the Paradise Lost, or Bunyan to write the Pilgrim's Progress; longer time than Fulton was occupied in constructing his steamboat or Galileo in making his telescope, or Newton in toiling out his immortal "Principia."

Reader! make a close calculation of a single day's losses and you will be frightened. And let me hint to you, too, that you will work a great saving in your pastor's precious time by avoiding needless calls upon him in his study-hours, (which *ought* to be in the morning,) and by not keeping him waiting when he calls upon you. "Be short," is as good a motto for the parish as it is for the pulpit.—*Christian Intelligencer.*

Good Humor.—Let us cherish good humor and Christian cheerfulness. Let us endeavor to shake off the sullenness which makes us so uneasy to ourselves, and to all who are near. Pythagoras quelled the perturbations of his mind by the use of his harp; and David's music calmed the destructions of Saul, and banished the evil spirit from him. Anger, fretfulness, and pevishness, prey upon the tender fibres of our frame, and injure our health.

Miscellaneous.

THE INDIAN SUMMER.

There is a time, just ere the frost
Prepares to pass old winter's way,
When Autumn, in a reverie lost,
The mellow daytime dreams away;
When Summer comes in musing mind,
To gaze once more on hill and dell—
To mark how many sheaves they bind,
And see if all is ripened well.

With balmy breath she whispers low—
The dying flowers look up and give
Their sweetest incense ere they go,
For her with whom their beauties live.
She enters 'neath the woodland shade,
Her cephyrs lift the lingering leaf,
And hear it gently where are laid
The loved and lost ones of its grief.

At last, old Autumn, rising, takes
Again his sceptre and his throne,
With boisterous hands the trees he shakes,
Intent on gathering all his own.
Sweet summer, sighing, flies the plain,
And wailing Winter, gaunt and grim,
Sees miser Autumn hoard his grain,
And smiles to think it's all for him.

(Written for the Rural New-Yorker.)

PROMISE.

The tantalizing inequality between human aims and attainments — between the magnificent undertakings and the comparatively poor results that mark the progress of the intellect in its struggles to overcome and subject the forces of the universe, and possess itself of all knowledge — the but partial successes that reward the labors of the earnest striver, leaving always something more and higher to be desired — the impatient longing, and the slow, unsatisfactory answer — the immense gulf between aspiration and acquisition — the eager, subtle spirit and the cumbering flesh — poetic dreams and prosaic realities, are but different statements of expressions of the single fact of the wide diversity between human promise and fulfilment; promise not always standing for high purpose, resolution or endeavor, because mortals often fail to recognize the loftiest aims as well as their own capabilities; perhaps are never fully aware of the latter; and, however great their wish, men do not undertake what they have no hope of being able to accomplish; but ever, even where through life no "extraordinary, generous seeking" manifests itself, represented by the something that awakens in fond parents the expectation of great future excellence in their children, reveals to partial friends a richness of endowment and possibility in their favorites, equal to the most exacting demands, and inexhaustible by a life of the greatest social and intellectual activity, and, in short, requires of each inhabitant of the earth that he justify his existence by proving that he is called to some work no other can perform so well as himself, and that to the extent of his means and opportunities, he leave the world the better for his having lived in it.

Man's whole life is an assertion of self importance. The coming of each individual into the community supposes our need of him, and involves an engagement on his part to satisfy that need. The advent of the teacher is a plain declaration that the juveniles of the neighborhood are wanting in orthography and arithmetic, and that he is able to supply that deficiency; the physician excuses his coming on the ground that we are liable to be sick, and must have medicine; the blacksmith presumes we will be better accommodated by a shop at our door, than by resorting to the next village for such wares as he offers; indeed, every settler in the town, whether farmer, artizan, or professional man, virtually promises to enrich the society of which he is to become a member, and to make the connection he professes to establish more advantageous to others than to himself; (wisdom, foreseeing men's horror of poverty, warns the adventurer not to seek his fellows mendicant,) otherwise he comes as an intruder, and has no right to an establishment, and any claim he may make thereto will be vigorously disputed. This apparently delicate assumption of the society's insufficiency gives no offense, (probably is scarcely ever recognized, because the unspoken thought, fullest of meaning, is least understood,) but is cheerfully, though unconsciously, acknowledged so long as the relations of the new resident with his neighbors or patrons are such that the latter, instituting a comparison between services received and compensation rendered, do not find a balance in favor of the late comer; but if, after a time, it appear that he sought them out of his own need — if, on trial, he prove incompetent, and another man than, by engaging to perform a certain work, he recommended himself, and one for whom they have no use, they, perhaps silently, but emphatically, apprize him of their judgment, and he stands *discharged — not wanted* — and can with difficulty remain in the settlement a day after such a decision. Only the beggar approaches, pleading his own necessities, and invoking a blessing on the bestower of alms; but a proposal on his part to take up a permanent residence among those who are good enough to *help him on his way*, is treated with utter derision; a manifest determination to do so, suggests an early application to the proper authorities for his removal; and his departure is hailed as a joyful deliverance.

Every genuine act, every true expression of opinion, whether gratuitous or otherwise, is equivalent to a fresh enlistment in the service of the principle it concerns; and commands respect and confidence in proportion to the habitual constancy and disinterestedness of the person making the engagement. Thus, the antecedent life is the real promise. When a man has earned a reputation for single-mindedness and fidelity, where he professes devotion, we can easily believe him sincere if he announce a change of sentiment, and have no fear that he will be less faithful to the new light than he has been to the old. There is no need of clenched fists or flushed faces to give emphasis to a statement of views. The would-be-legislator, who calls on the voters of his district with expressions of intense attachment to the principle of self-government, and to the ideas underlying certain reform movements, provokes the inquiry whether his relations as a private individual, show that he is desirous every other person shall enjoy equal freedom with that he demands for himself; the answer to which settles the question as to whether he is at heart a disciple of Democracy or of Tyranny; and so of other principles or measures on which he may think proper to define himself. Very often, an eye left behind to catch the after-smile, and an ear to report the remark that succeeds his departure, would inform the busy canvasser that his late hast distrusts the immodest zeal that travels out of the way to publish itself, and that he has taken the promise it implied, at a ruinous discount. For, we like not that men give such laborious advertisement of themselves; emergencies will prove them, and we can wait till they rise and give opportunity. No matter how earnestly an individual declare his strength, either for attack or resistance; if the occasion prove too much for him, his self-estimate is too high and unworthy of trust; indeed, the truly strong rarely proclaim their strength.

It is perhaps within the experience of every general reader that, many times, the title of an essay or lecture conveys more or suggests more to a quick, active mind than the composition itself does. In other words, the writer exhausts himself in his text. I remember reading, some two years ago, a report of a lecture, in which I can recall nothing that said so much to me as the mere title. The subject, as set forth by the words at the head of the discourse, was a ray of glorious inspiration, worthy to be sung by the whole band of living reformers in their triumphal march, and chanted at the graves of those who have perished on the battle-field in the service of that great liberator, Truth, which unbinds the shackles from the limbs and from the souls of humanity, but it was beyond the speaker's power to answer expectation on such a theme, for he had said more in announcing it than he could possibly say in any other words. Thus, the selection of lofty or abstruse themes for composition, by persons of inadequate power to treat them successfully, is not perhaps so generally as is apt to be supposed attributable to self-conceit and an over-weening estimate of their preparation for the task assumed; a truer interpretation would oft-times refer it to a generosity of aspiration, needing years of mental culture for its satisfactory expression, perhaps destined never to be rewarded by a success proportioned to its striving, but unable to resist the impulse to say what is in its heart to do, if only its ability to accomplish were equal to its willingness to undertake. So the bare list of subjects, with the names of the several writers, but without a word of the body of the discourse, sometimes contained in the reports of College commencements, is justifiable as indicating the direction in which the genius of the various students tends. The world does not require that young men and young women, still at their studies, shall have already distinguished themselves in literary creation; but only asks that by present nobility of aim they give promise of future excellence. And, in this connection, we may observe the great faith the majority of writers have in their own inspirations, by the willingness, sometimes apparent eagerness, they manifest to assume the responsibility of what they say. For, as between what is said and by whom it is said, the former is of first importance, it would seem the appropriate place for the author's name is after his work, rather than before it; yet our ideas of good taste and propriety are constantly offended by seeing it in newspapers and magazines between the notice of the subject treated and the opening paragraph. We follow nature more closely in our correspondence and business transactions, affixing our stamp only to the finished work, for authenticity's sake; whereas, in general literature, its frequent office is to answer for and give currency to whatever chooses to follow it.

Finally, in regard to the general nullities of acting on this exaggerated self-reckoning, or contempt of reckoning, we doubtless owe much to the fact that men enter upon labors entirely disproportioned to their strength. Who can estimate the number of happy discoveries and inventions that have been stumbled on by persons searching and experimenting with the purpose of finding out other and deeper mysteries than those they have thus accidentally brought to light? We need not then call any portion of this courage of enterprise superfluous; we know not how much less its possession would have accomplished without it; as in crossing a river, if the boatmen row exactly toward the point he wishes to gain, he will land below it, and in order to reach a point opposite the one from which he set out, he must gain considerably higher. A.

South Livonia, N. Y., 1854.

A LEGACY, AND WHAT CAME OF IT.

I am, or rather *was* a small farmer, residing on a tolerably productive tract of land bequeathed to Mrs. Boozy by a bachelor uncle that died—peace to his ashes!—about two months after we were married. I bless the memory of my wife's uncle, for had he forgotten Mrs. Boozy in his will, your servant at the present writing might have been in far more embarrassing circumstances than those in which he is now placed.

When Mrs. Boozy and I took possession of the farm, she was perfectly cool and collected; for, in the words of the great Micawber, she had for years known that something was about to "turn up;" but I was in ecstacy; in fact, I felt very thankful for the circumstance which had thus opportunely occurred, placing us in a situation to get a living.

Well, we commenced farming in earnest.—Mrs. Boozy made capital butter and cheese, and I raised very fair crops of wheat and corn. I trimmed up the apple-trees, put in grafts, planted shade-trees, and did various other things to beautify and improve the premises. Mrs. Boozy found farming profitable. Five years after taking possession of the place, we "figured up," and found we had a thousand dollars in the bank, a thousand in railroad stock, and some loose change in pocket, to say nothing of a fine lot of cows, a span of horses, etc., etc.

Mrs. Boozy was a very fortunate woman.—One night, about six years after we were married, she said to me:

"Boozy, I think of selling the farm."

"Think of *selling the farm*, Mrs. Boozy! you're joking!"

"Not a bit, Boozy. Widow Gomer says it's a perfect shame for us to live off here and work like slaves when we are abundantly able to settle in Skinpenny and enjoy ourselves; and I think Widow Gomer knows. I think she is right."

"Widow Gomer may—"

"Now, Boozy, you needn't go on in that way! The farm is mine, and the *stock* is mine, and I shall sell, and remove to Skinpenny, if I think proper, Mr. Boozy to the contrary notwithstanding!"

"But how shall we live?" I meekly inquired.

"On the interest of *my* money," answered Mrs Boozy; after saying which, she proceeded to undress herself, and we retired; she to dream of the pleasures of life in Skinpenny, and I to reflect on what Mr. and Mrs. Boozy were coming to.

Next day I felt "out of sorts," but I knew it would be useless to say a word; for Mrs. Boozy is a "strong minded woman, (women who have property in their own right usually are,) and my advice to all young men contemplating marriage is, *"Beware of strong-minded women and—widders!"*—(Weller;) for, as far as my experience goes, both are exceedingly pleasureless and profitless "institutions."

That afternoon Widow Gomer, Widow Dalus, and Susan Green (a blooming Miss of forty-five) drove to our door, having come all the way from Skinpenny on purpose to visit "dear Mrs. Boozy," whom they "hadn't seen for a whole week;" thinking perhaps she would give them a few of her beautiful gooseberries, currants and cherries; "they would look so beautiful on their tables at home."

I busied myself in the field till the trio had gone, and then I went to the house, to find my—no, Mrs. Boozy's "beautiful gooseberries, currants and cherries" (they were of choice varieties, for which I paid quite a sum, and this was the first year they had borne any fruit) all gone; and the worst of all Mrs. Boozy in tears; it was "so lonesome, she couldn't bear the thought of living on the farm any longer. Widow Dalus said *she* wouldn't live there for the world; Miss Green had "rather die than be obliged to stay there over night," and Widow Gomer said she had better sell, even if she didn't get more than half what Mr. Boozy thought the place was worth."

A few days after, Mrs. Boozy made Widow Gomer a visit, and (just think of it!) the widow told her she had a son who, she thought, would like to purchase the farm, "provided he could get it at a *low price*." To make a long matter short, he bought it for less than half what it might have been sold for; and now the widow lives with her son on that "so lons farm," and *we* live in Skinpenny; but I cannot see that we enjoy ourselves any better than we did before we took up our residence here. For my own part, I am perfectly miserable. Our garden is so small that I cannot busy myself in it more than one day in a week, and the neighbors' hens dig up every seed I plant.—When I think how much we lost, and how little we gained when we changed our place of abode, I can hardly contain myself.

P. S.—Mrs. Boozy and I visited Widow Gomer at the farm to-day. I asked the widow if she could spare us a few of her "beautiful gooseberries, currants and cherries." She said she was, "sorry," but they had no more they wanted for their own family use!—*Knickerbocker.*

Providing a Home.—Especially ought every married pair, says Fowler, to secure a permanent residence for themselves and children; for without it, one powerful mental faculty must suffer perpetual abrasion, and many more diminished and interrupted action and pleasure. This "moving" is ruinously costly, alike destructive of property and pleasure, cripples husbandry, prevents planting trees and vines, and obliges tenants to frequent the grocery, with money in hand, for a thousand little things, which, if land owners, they would *raise*. None can duly appreciate home, till having once owned and lost one; after being cast upon the stony-hearted landlords, they repossess themselves of a comfortable domicil, again to feast upon the products of their own gardens and orchards. Father, mother, whoever, wherever thou art, heed this important advice—provide a home first, whatever else you do or leave undone, and however stringent your poverty, even as your best means of escaping it.

DAYS WITHOUT NIGHTS.

There is nothing that strikes a stranger more forcibly, if he visits Sweden at the season of the year when the days are longest, than the absence of night. We arrived at Stockholm from Gottenburg, 400 miles distant, in the morning in the afternoon went to see some friends—had not taken note of time—and returned about midnight; it was as light as it is here half an hour before sundown. You could see distinctly. But all was quiet in the street; it seemed as if the inhabitants were gone away, or were dead. No signs of life—stores were closed.

The sun goes down at Stockholm a little before 10 o'clock. There is great illumination all night; as the sun passes round the earth toward the north pole, the refraction of its rays is such that you see to read at midnight. Dr. Baird read a letter in the forest near Stockholm at midnight, without artificial light.—There is a mountain at the Bothnia, where, on the 31st of June, the sun does not go down at all. Travelers go there to see it. A steamboat goes up from Stockholm for the purpose of carrying those who are curious to witness the phenomenon. It occurs only one night — The sun goes down to the horizon; you can see the whole face of it, and in five minutes it begins to rise.

Birds and animals take their accustomed rest at the usual hours. The hens take to the trees about seven o'clock, P. M., and stay there till the sun is well up in the morning, and the people get into the habit of rising late too.

REVOLUTIONARY RELIC.

The bullet by which Gen. Joseph Warren was killed at Bunker Hill, in 1775, is still preserved. It is an ounce ball, and was exhibited by Alexander H. Everett, on the delivery of an oration at Charleston, June 17th, 1836, in which he exclaimed,—"This is the one, fellow citizens, which I now hold in my hand! The cartridge-paper, which partly covered it, is stained, as you see, with the hero's blood." This ball is now deposited in the Library of the United States Historic-Genealogical Society, with the original affidavit of Rev. William Montague, formerly pastor of Christ Church, in this city, who made oath that he obtained the ball in London, of Arthur Savage, once an officer of the Customs of the port of Boston, who gave Mr. Montague this account of the ball:

"On the morning of the 18th of June, 1775, after the battle of Bunker, or Breed's Hill, I, with a number of other royalists and British officers, among whom was Gen. Burgoyne, went over from Boston to Charlestown to view the battle field. Among the fallen we found the body of Dr. Joseph Warren, with whom I had been personally acquainted. When he fell, he fell across a rail. This ball I took from his body; still, as I shall never visit Boston again, I will give it to you to take to America, where it will be valuable as a relic of your Revolution.

VALUE OF A MANUSCRIPT.

The original manuscript of Gray's Elegy was lately sold at auction in London. There was really "a scene" in the auction room! Imagine a stranger entering in the midst of a sale of some rusty-looking old books. The auctioneer produces two small half sheets of paper, torn and mutilated. He calls it "a most interesting article," and apologises for its condition. Pickering bids ten pounds! Boyd, Foss, Bohun, Holloway, and some few amateurs, quietly remark — twelve, fifteen, twenty-five, thirty, and so on, till there is a pause at sixty-three pounds! The hammer strikes. "Hold!" says Mr. Foss. "It is mine," says the amateur. "No, I bid sixty-five in time." "Then I bid seventy." "Seventy-five," says Mr. Foss; and lives are repeated again, until the two bits of paper are knocked down, amid a great cheer, to Payne & Foss, for one hundred pounds sterling! On these bits of paper are written the first draft of Elegy in a Country Church-Yard, by Thomas Gray, including five verses which were omitted in publication, and with the poet's interlineations—certainly an interesting article,"—several persons supposed it would, call for a ten pound note, perhaps even twenty. A single volume, with "W. Shakspeare" on the fly-leaf, produced, sixty years ago, a hundred guineas; but probably, with that exception, no mere autograph, and no single sheet of paper, ever produced the sum of five hundred dollars.

A Cloudless Sky.—In Egypt it does not rain, and there are no mountains to intercept the clouds, nor a broad ocean on the West to yield copious moisture supplying water for dew. But the All-wise Creator and giver of every good and perfect gift, was at no loss to make the country what she once was—the granary of the world. Egypt is a level country—the Nile, which waters it, rises in the Mountains of the Moon, as the rivers in South America do in the Andes, causing the Nile to overflow its banks at a proper period every year. The rains last long enough, and the distance is just great enough to produce the flood two months after the rain has fallen.

The Railroad to Ruin.—Surveyed by an artier, chartered by county courts, freighted with drunkards, with grog shops for depots, rumsellers for engineers, bar-tenders for conductors, and landlords for stockholders. Fired up with alcohol, and hoffing with delirium tremens. The groans of the dying are the thunders of the train, and the shrieks of the women and children are the whistles of the engines.—By the help of God we will reverse the steam put out the fires, annul the charter, and save the freight.

The eminent Dr. Rush says that the exercise of the organs of the breast by singing, contributes to defend them from those diseases to which the climate and other causes expose them. The Germans are seldom afflicted with consumption—a fact attributed, in part, to the strength which their lungs acquire by exercising them frequently in vocal music.

THOUGHTS FOR LOUISE.

BY JENNY A. STONE.

I am thinking of our school-days,
Happy days so quickly flown;
O, I know their golden visions,
From your spirit have not gone,
And I feel my name is woven
In fond memory's golden net,
For you told me when we parted
That you never *could* forget.

Dear Louise, a year has fleeted
As a vision of the night,
Since you vanished like a spirit
From my tear-dimmed, aching sight:
Other friends have crowded round me,
Other hearts seemed fond and true,
But I've kept sweet Friendship's fountain
Pure and sparkling still for you.

Surely you have not forgotten,
All the cherished scenes of yore,
How each morn our footsteps entered
Through that old, familiar door,—
How the staid professor watched you
From his high, accustomed niche,
Thinking one with eyes so sparkling
Could not fail to prove a witch.

But my face so long and solemn,
And my eyes of sober hue,
Made him dream the name of mischief
My meek spirit never knew.
Ah! he thought not we were maied
Hand to hand, and heart to heart,—
That in every school-girl frolic
I could bravely bear my part.

But the shades of night are resting
On the distant hill-tops low,
And the dews of eve are falling
Coldly on my cheek and brow;
'Neath the trees I have been dreaming
In the day beam's waning light,
But your spirit has departed—
Dear Louise, a sweet good-night.

"I'M GOING HOME."

Dear little Ada! she was dreaming of a vine-encircled cottage far off in a pretty village where she had passed her earliest childhood. The sound of the babbling stream greeted her ear—the song of the birds rang out merrily on the clear calm air, and the flowers looked up to the blue eye, offering the same fragrance at the shrine of their Creator, as they did on the day she bade her country home adieu forever. Visions of rich red strawberries, blushing amidst a drapery of deep green—rosy-cheeked apples, coquettishly peeping out from the heavy foliage of tall trees—of brown nuts snugly hidden away between sweet-smelling clusters of many colored autumn leaves, came to her in her sleep.

But the dream-spirit brought to the sick child one vision more welcome than all the rest—the shadowy form of a gentle mother, with a smile brighter than the sunshine in the old wood, and a kiss softer than the dew-drop over gave the rose. Poor little Ada! sad indeed was the day when that meek and patient one calmly yielded her breath whilst her pure soul went to rejoin the loved husband, who bade adieu to life ere "the baby" had given him its first smile.

Ada could not understand why "mamma" laid so still, and why she replied not to her earnest pleadings for "one kiss—only one kiss." We tried to make clear, to her innocent mind, the mysteries of death, but she sadly shook her head, and asked, with a strange puzzled look in her large blue eyes, "Why did not God take me to be an angel too?"

Darling little Ada! she wept bitterly when we took her away from the birds, and trees, and flowers, and bore her to our city home.—She had always been a tiny fragile creature, and from the very hour she first breathed the impure air of a crowded city, she began to fade like a wild wood blossom, deprived of its native breeze and sunshine. We knew that she must die, and for fear that death might steal her from us, whilst we were unaware of its approach, we sat beside her couch for many days and many nights, silently awaiting his coming.

One summer eve, as Ada slept, a brilliant smile broke over her sweet face, and clasping her thin small hands, as though in joy, she exclaimed, "I'm going home!" Before morning Ada *did* go home—not to the willow shaded cottage home, but to a home where the *heart* can only find rest—a home in heaven.

God in his infinite mercy grant that I, weary, sad-hearted one, may soon triumphantly exclaim, "I'm going home!"—*N. Y. Picayune.*

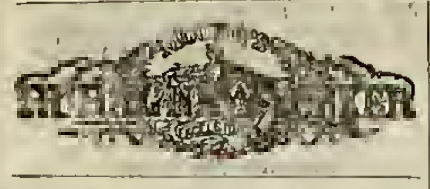
MUSIC AT HOME.

Music serves to make home pleasant, by engaging many of its inmates in a delightful recreation, and thus dispelling the sourness and gloom which frequently arise from petty disputes, from mortified vanity, from discontent and envy. It prevents for the time, at least, evil thoughts and evil speaking, and tends to relieve the minds of both performers and hearers from the depressing effects of care and melancholy. Young people need and will have amusement. If an innocent and improving kind be not provided at home, they will seek elsewhere. If they find places more agreeable to them than home, that home will be deserted; and thus the gentle and holy influences which ought to encircle the family fireside, will be in a great measure lost.

"For surely, melody from heaven was sent,
To cheer the heart, when tired of human strife;
To soothe the wayward heart, by sorrow rent,
And soften down the rugged road of life."

Let parents, therefore, take pains to encourage and gratify a taste for music in their children, and it will amply repay them for so doing.

Immoral words are in all cases indefensible.



ROCHESTER, NOVEMBER 11, 1854.

Your Interest, and Ours.

Your elbow and ear a few moments, friendly reader. During the year which is now rapidly terminating, we have talked to, if not with, you on various subjects, and usually found an exceedingly good listener,—for you have proved both patient and attentive, and we trust our converse has, as we sincerely desired, redounded to your welfare. Our efforts have been regular and untiring: we have labored early and late, in health and while suffering from illness, to furnish from week to week, and month after month, that which should instruct, interest and entertain yourself and the individuals composing your family circle. And having thus continuously and zealously endeavored to enhance *your* interests, we frankly and confidently invite your attention to *ours*,— and to the inquiry whether, on the principle of reciprocity, the promotion of the latter is not compatable with, or indeed conducive to, your own prosperity.

Probably you have read the Prospectus of our Sixth Volume, published two weeks ago, and also a list of Premiums offered to Agents, Subscribers, and others disposed to aid in furthering our enterprise. Well, my friend, in making these announcements we were and are conscientious and confident—conscientious in the belief that we could, extraordinaries excepted, fulfil our assurances to the letter; and confident that, as heretofore, our honest and earnest endeavors to improve the RURAL—to augment its usefulness by increasing its value and extending its circulation—would be generously seconded by thousands of progressive and influential readers, located in all sections of the country. But it is unnecessary to assure you of our sincerity and earnestness,—for we trust our former *acts* and *works*, have demonstrated both to your satisfaction; if not, mere *words* and *assertions* are unavailing. Indeed, we have ever placed our principal reliance upon the *intrinsic merits* of the RURAL—knowing that the approval and support of the thinking and intelligent class of community could only be secured by presenting a work of substantial and permanent value. Hence we have from its commencement devoted our chief efforts and expense upon the *contents* and *appearance* of the paper itself, regarding all other means of advertising and "pushing" as of comparatively little importance. True, we have advertised extensively, and offered agents, and others disposed to lend their assistance, more liberal inducements than any other Agricultural publisher,—yet we have never sought or desired any man's money or influence, without he first became satisfied that his own, and the interest of community, would thereby be promoted.

Money-making has not been our chief object in the publication of the RURAL: on the contrary, our principal aim has been to EXCEL in advocating and advancing the cause of Rural Improvement. Indeed, our expenditures have been so liberal in every department—for Matter, Labor, Material, &c.,—that our pecuniary ruin has annually been predicted for the past five years; and yet, our subscription list and consequent receipts have so largely increased from year to year, that, confidently relying upon the continued support and encouragement of the thousands to whom we are indebted for such extraordinary success, we have resolved to expend more upon the forthcoming volume, than either of its predecessors. To accomplish this, however, to the full extent desired, abundant means are essential, and for these we depend upon a largely increased subscription. And hence, kind reader, we frankly ask your friendly offices in behalf of the RURAL,—that you will, so far as convenient and consistent, introduce it to the notice and support of your fellow townsmen. There are many ways in which this object may be accomplished, each requiring but little individual effort or attention. All that is necessary in most places where the RURAL circulates is to *ask the people to subscribe;* such at least is the assurance of many friends and agents, and their success has proved the correctness of the assertion. What we request of you, therefore, is the favor to receive and forward the subscriptions of the friends and acquaintances with whom you may come in contact—remembering that each and every addition to our list will furnish substantial assistance in the prosecution of our enterprise.

Great Fire at Lockport.

A very disasterous fire occurred at Lockport on the evening of Thursday, Nov. 2d, by which two Churches, two Hotels, and a number of stores and private dwellings were consumed.—The wind was blowing a gale at the time, and notwithstanding the most strenuous exertions of the firemen and citizens, the flames became uncontrolable and spread from building to building with the most desolating effects.

Soon after the fire broke out, a telegraph dispatch was sent to Buffalo for aid, and the Railroad Company, with commendable liberality, immediately, dispatched an Engine to bring down the Buffalo firemen. The train arrived, bringing two Engine Companies with their machines—a Hook & Ladder Company and a Hose Company, in time to lend efficient aid in staying the progress of the flames.

Meteorological Observations.

BY A. J. ENSIGN, OBSERVER.

Coldest Day		30th		11th
Warmest Day		8th		20th
Amount of Rain		5.185		1.635

JULY.—Most of this month the weather was delightful; fair days, sky almost cloudless, clear starlight evenings. The degree of temperature for the month ranges high—the heat during the last half, especially, being exceedingly oppressive. The monthly mean exceeds that for the same month last year by 6°02. The warmest day of the month was the 20th, when the thermometer stood at 95°; for that of last year the 3d was the warmest, the thermometer standing at 87°. But little rain fell. There was a rain-storm on the night of the 4th, and a slight sprinkle on the afternoon of the 9th. During the last half there were several small showers. The number of rainy days—on most of them there was but a slight sprinkle—was six. The amount of rain for the same month last year was 1.000.

AUGUST.—Here, as in most places, but little rain fell during this month—none of note the first part, and but a few slight showers at the last part. It was extremely dry and dusty.—On the 14th, and again on the 23d, 26th and 31st, there were light rains. There were, however, other days on which there was a fine sprinkle, but none sufficient to be measured by the pluviameter. The amount of rain, as seen in the above table, was 1.826; that for the same month last year 2.010. The mean temperature of the month differed little from that of last year, being then 71°4. The warmest day of this month last year was the 12th, the thermometer standing at 96°; this year the 30th, the thermometer being at 95°. Two bright meteors were seen at 9 o'clock on the evening of the 17th.

SEPTEMBER.—In this month there were frequent showers of rain, and the amount of water fallen was considerable. On the 14th and 15th there was a heavy rain storm. The number of rainy days was 13. Though the quantity of rain for this month was very great, compared with several of the preceding, yet there was less on the same month last year. The amount then was 6.833. There is very little difference in the mean monthly temperatures. That of last year was 62°7; this year 64°65. The warmest day of this month last year was the 6th, the thermometer being at 88°. Some frost at the close of the month, but not sufficient to affect vegetables.

OCTOBER.—Some few of the first days of this month were cloudy, with slight showers. Then the weather became warm and pleasant. From the 9th to the 14th there were frequent rains—somewhat colder, hail and snow fell. The last half was mostly fine—Indian Summer. There was a thick fog on the mornings of the 26th and 27th, not clearing away on the 26th till 8 A. M.—an unusual occurrence for this section of country. From the 21st to the close, fine, beautiful weather, excepting the last two or three days, on which there were slight showers of rain. On the night of the 20th the ground froze quite hard, and in exposed vessels of water ice formed a fourth of an inch in thickness. A beautiful rainbow was seen at sunrise on the 30th. The amount of rain fallen was nearly equal to that of the same month last year, being then 1.702—making a difference of only 067 of an inch. The number of days on which rain fell, including those when there was for a few moments a mere sprinkle, was 16. The mean temperature was greater than that of last year, being 53°; then 47°1, leaving a difference of 5°9. The warmest and coldest days were the 20th and 11th, the thermometer being at 73°9 and 32° respectively; for the same month last year the 3d and 15th were the warmest and coldest days, the thermometer standing at 75°2 and 33°1.

The following table shows the amount of rain and melted snow fallen during each successive month of the two preceding years, and thus far of the present. The measurement is given in inches and decimals of an inch.

	1852.	1853.	1854.
January,	2.130 inches.	2.470 inches.	1.814 inches.
February,	0.858	2.868	2.863
March,	3.213	2.297	1.073
April,	3.927	3.245	3.643
May,	2.080	4.725	2.140
June,	4.590	1.450	5.473
July,	4.000	1.000	0.252
August,	1.330	2.010	0.108
September,	2.970	6.833	5.185
October,	3.890	1.102	1.635
November,	2.855	2.342	
December,	2.200	1.123	
Total,	34.351	32.695	24.890

The annual amount of rain, as indicated by the pluviameter, usually varies from thirty to thirty-six inches.

University, Rochester, N. Y.

THANKSGIVING.—The Governors of Wisconsin, Maryland and Florida, have each appointed the 23d inst. to be observed as a day of thanksgiving and praise, in their States respectively. The Governors of the following States have made similar appointments for the 30th, viz.,—Maine, New Hampshire, Massachusetts, Ohio, Indiana, Pennsylvania, and Kentucky.

—The cargo of the Arctic is estimated to have been worth one million of dollars.

Forest Leaves from the West.—No. 3.

GRAND RAPIDS, Mich., Oct. 27, 1854.

FRIEND RURAL:—Since my last, I have returned from a trip west of here. I find the adjoining States very much improved in every point of view, but of all the States which I have visited west of this, I find none which I prefer. Michigan, Illinois, Wisconsin, Iowa, and Minnesota are good countries in a general point of view, but there are exceptions which are material in my opinion.

Michigan possesses many advantages over her sister States. She has almost an unbroken water navigation surrounding her borders, besides navigable rivers running through the interior, all emptying into Lake Michigan, on her western border. These advantages very much facilitate her commercial interest, serving, as they do, for transporting her products to their destined markets. Not only these means are valuable, but there are already two excellent Railroads spaning the State from east to west, besides the third, which is already in operation from Detroit to Pontiac, and is under contract, and now being extended to this city, so on to the mouth of Grand River, on Lake Michigan, and which is certain to be completed within two years.

We do not mean to say that these other States do not possess these advantages at all, but they do not to that extent and uniformity which Michigan does. Michigan has other valuable considerations, which makes her more than desirable. It is a good wheat State, extensively so I think. Corn, and every other agricultural product raised in any Northern State, is luxuriantly produced here. She has *no superior* in the Union, so far as my observation will allow the assertion, for agricultural purposes. Then, too, her commercial advantages are unequalled. Northern Michigan contains the best pine timber for lumbering purposes of any State, excepting Pennsylvania. Her timber is along the Grand and Muskegon, and other smaller rivers emptying into Lake Michigan, which afford navigable facilities to Chicago and other points among the "prairie regions" of the West. At Grand Rapids inexhaustable Plaster beds are found, of the best quality. When ground it is almost as white as Buckwheat flour. I visited the establishments to-day. The Plaster is sold for $3,75 to $4 per ton.

About one hundred miles north-west from Detroit, stone coal is found, and it is confidently supposed to a large extent. Besides all these advantages, manufacturing is becoming prominent. Michigan has very many fine water powers, which but few States contain. At this place the power is magnificent.

FRANK FOREST.

COLLISION.—As the engine Lancaster was backing down from the engine house on Crown Square, in this city, on Friday, when between Platt and Johnson sts, it met the locomotive Ontario, with an emigrant train, bound out, and a collision occurred, which damaged the engines somewhat. The Lancaster had come in upon the direct road from Syracuse, and on the way ran over three cows. Something of a day's work in the extras.—*Democrat.*

The Central road is greatly in need of another track from the engine houses down to the passenger depot; but obstacles seem to intervene in the too much cutting up of Central Park, now nearly ruined by the road. The most feasible way to avoid the difficulty, would be for the city and the railroad company to "swap horses;" the latter taking up the old Buffalo track across the Park, and running all their trains outside the city limits over the Lockport line. Three tracks would occupy less of the Central Park in this way, than they do now.

FATAL RAILROAD ACCIDENT.—On the night of Wednesday, Nov. 11th, the engine of a train going west from Chicago, on the Rock Island Railroad, ran over a horse near Joliet, breaking an axle of the locomotive, and precipitating it, with two passenger cars, down an embankment. The passenger cars were thrown forward upon the engine, and the hot steam escaping therefrom fatally scalded ten or twelve persons. Nut less than forty passengers and employes were either bruised or burned, and a sad wreck was made of the cars. Where the next accident will happen we are unable to say, but the ink is scarcely dry from recording one, ere another is upon us in all its varied and sickening horrors.

A DOMESTIC DIFFERENCE.—In the London Times appear the two following advertisements, the one immediately after the other:

FLOWN AWAY, from a villa in St. John's wood, a most charming GRAY PARROT. It is a very lively bird; and although its articulation is indistinct, it will talk for hours with the greatest ardor. Whoever has caught it is pressingly requested to treat the sweet creature well, not to pay attention to its biting, and to return it to its inconsolable mistress, who will pay a reward of Three Guineas.

Address Mrs. DE PUFFELTS, Acroceraunia cottage, St. John's Wood.

FLOWN AWAY, from a cottage in St. John's Wood, a GRAY PARROT, that can be recognized by its ill-nature as well as by its never speaking a word, but screeching for hours at a time in the most disgusting way without any occasion. Whoever has caught it, and will deliver it *stuffed* to the undersigned address, shall receive Four Guineas and grateful thanks.

Mr. DE POPPELTS,
Acroceraunia cottage, St. John's Wood.

It is said that Russian agents abound in London, part of whose duties it is carefully to examine all the public papers, and immediately transmit everything important to St. Petersburg. A telegraphic communication between London and St. Petersburg occupies eight hours. The contents of the morning papers are known by the Czar at three o'clock the same day.

News Paragraphs.

☞ John Todd, a member of an organized band of thieves and desperadoes in Philadelphia, called the Schuylkill Rangers, has been arrested, and committed for trial on a charge of burglary. It is stated that these Rangers number twenty-five men, all armed with pistols and bowie knives. The dread of the gang is spread thro' all the western section of the city.

☞ At a recent meeting of the British Academy of Science, Col. Chesney stated that there had been for many years a well organized system of life-boats in Liverpool, by which 1,329 lives had been saved since 1840, and 312 vessels rescued, which would probably give 60,000 tons, and taken at £10 a ton, would give an amount of £60,000 property saved by that means.

☞ The Boston Courier speaks of a new style of gold pen, which has just appeared in that city. This pen has four points, two of which are protected with a substance called iridium. These points on blades are protected by the other two points. It requires filling with ink but twice an hour, thus rendering it of as little trouble as an ordinary pencil.

☞ The Baltimore American says the cost to the Susquehanna Railroad Co., in consequence of the Fourth of July collision, is, so far, including the damages paid to the sufferers, about $30,000, there being but one more claimant yet to settle with, who demands $5,000 for the injuries he sustained.

☞ A Mr. Morton, of Greenfield, who lodged at the hotel in North Adams, a few nights since, put his wallet, containing $200 in bills, between the beds for safety, and thought no more of it till after his arrival home, when he wrote back to the landlord, who found it according to direction, and despatched it to the lawful owner.

☞ The receipts of Breadstuffs, oats and barley at Buffalo, on the 1st inst., were the largest for any one day this season, amounting to a total of 230,000 bushels of grain and 9,000 barrels flour. The receipts of wheat were 60,000 bushels.

☞ The warm weather has delayed the commencement of the pork packing business at the West, but hogs are being "mustered" in large numbers on the field of slaughter. The Louisville Courier, of Thursday week, announces the arrival of over six hundred porkers by railroad, and other lots have arrived on foot.

☞ A great depreciation in real estate is apparent in New York and its vicinity. Seven houses in Brooklyn, were sold at auction a few days since at from nine to eleven thousand dollars each, being much less than their cost. They are among the most elegant and costly in the vicinity of New York.

☞ At this moment Bonaparte belongs to a tailor. *Sic transit gloria mundi!* Gen. Baraguay d'Hilliers made a present of the ruined fortress to a tailor named Claes Bergren, and this person is now selling bricks, &c., from the ruins to any one who will buy. Bergren had served the French General as interpreter.

☞ Alexander Von Humboldt was in the enjoyment of his 85th birth-day on the 14th ult. The illustrious philosopher is in the enjoyment of full bodily health and intellectual vigor, and continues, as heretofore, to devote himself with wonderful activity to the interests of science.

☞ The Reading, Pa., Steam Forge is making hollow axels for Railroad cars, the first ever turned out on the continent. They have been scientifically tested, and are not liable to fracture, can sustain more weight, and last longer than the solid axle.

☞ Ten thousand dollars have been raised in England, to do honor to Lt. Bellott, who lost his life in searching for Sir John Franklin. At the Greenwich Hospital, a granite obelisk is to be erected for $2,000, and the rest of the money to be equally distributed among his five sisters.

☞ Mr. Carey, Sunday School Agent at St. Louis, says that 1,000 Sunday Schools have been organized in Missouri and parts of Illinois and Iowa, in the last nine years. There are between 600 and 700 in Texas.

☞ The Lake Superior Journal says:—"Eight years ago the first steamboat was put on Lake Superior, at which time we had but one small steamboat plying between the Sault and Mackinaw; now we have eight steamers here in one day."

☞ At the recent State Fair, a patch-work quilt was exhibited containing samples of the dresses worn by the wives of all the Presidents except Washington's. It was made by Mrs. Linn, widow of Hon. Lewis F. Linn, former U. S. Senator from Missouri.

☞ The Journal of Commerce remarks that the ship building interest in New York and on Long Island is suffering much at present.—There is not much demand for vessels, and every material has risen to such a height that ship building is not profitable.

☞ A suit was recently in progress in Cincinnati, before a magistrate, to recover from the publishers of a weekly journal the amount of a week's salary of an editor, which was withheld in consequence of the said editor being absent on a trip to the east.

☞ Dr. Clark has accepted the Bishopric of the Diocese of Rhode Island, and Judge Staples has been elected Chief Justice, and Alfred Bosworth and Sylvester Sherman, Associate Justices of the Supreme Court.

☞ Delmonico, in New York, pays a handsome sum, at his place down town, to young men for eating oysters every forenoon. The example afforded is profitable during the temporary prejudice against the bivalves.

☞ Gov. Winston, of Ala., was fined $10 a few days ago, by a Circuit Judge in one of the counties of Mississippi, for wearing his hat and puffing a cigar in the Court room during the session of the day.

☞ The Rev. Dr. Potter, Bishop elect, is to be consecrated on the 22d of November. The Albany Register says that the Bishop will not take up his residence in New York until the ensuing Spring.

☞ A letter dated Marion, Ala., Oct. 16, says that Howard College had been burnt to the ground, and that twenty boys were greatly injured by jumping from the windows. Two of the number were reported to have died.

☞ It is said that $8,000 have been received towards the endowment of a new Bishopric of the Church of England, the diocese to embrace all that part of Upper Canada lying between the Grand River and the Detroit River.

☞ The proprietors of the Collins Line have ordered five metallic life boats for each of their steamers, which, with what they now have, will provide for 400 persons, with water and provisions for several days at sea.

News Brevities.

—The receipts of the New York State Fair amounted to nearly $10,000.

—It is stated that the Mormons contemplate a settlement in Kansas.

—The British Post Office pays the Railway $370,000 a year for carrying the mails.

—Upwards of three million gallons of lager beer are consumed annually in New York city.

—The loss of cotton by the late storms in Texas is estimated at 30,000 to 50,000 bales.

—The receipts of the Brattleboro Horse Show were $1,000, and cover expenses.

—The Paris, Maine, jail been tenantless has for more than six months last past.

—Tunis Lane Smoke has been appointed, by Lord Elgin, Notary Public in Upper Canada.

—The New York Assay office now receives deposits on the same terms as the Philadelphia mint.

—Six Detroit hunters killed four fine deer in the swamp, four miles from Detroit, last week Saturday.

—Mrs. Gen. Gaines is about to renew her famous land suit. She is in Washington for this purpose.

—The total number of emigrants which arrived at the port of New York up to the 1st inst., was 273,551.

—The best winter apples are selling in Washington city fifty cents less than potatoes, by the barrel.

—A company of Chinese have gone from San Francisco to Utah, having been converted to Mormonism.

—It is rumored that Gen. Pillow, of Mexican notoriety, is to be sent to Utah, as Governor of Mormondom.

—A colony of Germans from Cincinnati are preparing to emigrate to Kansas. They propose to found a city.

—There is a boy in Chicago, fifteen years of age, who measures in his boots (low-heeled) six feet and eight inches.

—It is estimated that there is in this country of last year's stock 200,000 bbls. of pork and an ample supply of bacon.

—The Lake Superior Journal continues to urge the proposition to form a new State north and west of the Lake.

—A schoolmaster in Poughkeepsie whipped a female pupil who was 17 years of age, was tried therefor, and fined $365.

—Captain Dana, quarter-master at Fort Snelling, is charged with speculating with the official funds entrusted in his care.

—It is stated that in the western portion of Indiana, the best quality of Irish potatoes can be purchased for 25 cents per bushel.

—Twenty-five prisoners recently attempted to escape from the Baton Rouge Penitentiary, when two were shot and the others recaptured.

—The war taxes now imposed directly upon the British people, and paid for in hard cash, amount to $50,000,000 annually.

—A letter from Capt. Calhoun, in command at Ft. Chadbourne, Texas, says "we may now consider ourselves at war with the Indians."

—Twenty slaves, men, women and children, decamped from St. Louis on Sunday week. Men and bloodhounds were out after them.

—The price for a trip in M. Godard's balloon is $60, and one of the editors of the N. Y. Mirror, who has tried it, says it is cheap at that.

—A petition to Congress to repeal all duties now existing by law upon the introduction of foreign coals, is now circulating in Boston.

—The Clergy Reserves Secularization bill passed to a second reading in the Canadian Parliament, by a vote of 93 to 15, on Wednesday week.

—Samuel Drake, the pioneer of the drama in the west, and grand-father of Julia Dean, the actress, died in Kentucky on the 17th ult., at the age of 86 years.

—Dr. Brandeth, the pill man, and Professor Morse, the telegrapher, are Democratic candidates for Congress in their respective Districts of New York State.

—A Chicago paper estimates that the population of that city will reach nearly 120,000 by the 1st of January, 1855. The present number is about 60,000.

—A baggage car on the Providence and Fishkill road took fire the other day at Willimantic, and partially consumed several bales of cotton.

—The English papers mention the remarkable fact of the parish church of Southwait having had only two pastors in a period of 120 years!

—The Methodists have a larger church membership than any other denomination of Christians in the world, numbering nearly two millions.

—It is said that Dr. Ives, late Episcopal Bishop of North Carolina, is about to assume the editorship of a Roman Catholic journal in New York.

—The Maine Law has passed the Legislative Assembly of Canada by a vote of 85 to 5, and it will doubtless pass the Council, and immediately become a law.

—An exchange, describing a counterfeit bank bill, says the vignette is cattle and hogs, *with a church in the distance.* A very good illustration of this world's doings.

—Many private families in New York are said to be forming clubs, to supply themselves with provisions, &c., to avoid the enormous profits demanded by speculators.

—Asa Thomas, a resident of Nelsonville, Putnam co., while partially deranged, wandered from home and fell down a precipice 175 feet in height. When found he was dead.

Dr. Townsend, of N. Y., has donated four lots of ground, valued in the aggregate at $10,000, as a site whereon to erect a building for the "Christian Home for Female Servants."

—The emigration to Iowa this fall is beyond all precedent. The Burlington Telegraph anticipates an addition of 100,000 to the population of the State during the present year.

—The life-boat of the Arctic, which has been brought to Philadelphia, is pronounced quite capable of sustaining from fifty to sixty persons, instead of which it brought to land less than 30.

—Fifteen persons fell victims to cholera at Campbellsville, Ky., from Monday, the 16th, to Friday, the 20th ult. The disease was abating. The population of Campbellsville is only 400.

—It is stated that Worcester has in preparation a new unabridged English dictionary, which will contain upwards of ten thousand words not to be found in any work of the kind.

Western Correspondence.

Reports of Flying Travelers—Observations of a Sojourner—Ionia, Michigan—The Maine Law.

Messrs. Editors:—Among the countless multitude of newspapers now scattered, broad-cast over the country, and wending their way to the rude log-cabin in the little clearing, as well as to the palace within the city's limits, few indeed there are, that do not comprise within their matter articles headed "Notes from the Far West," "Sketches of Travel in the West from our own Correspondent," &c., &c. Passing observations on the manners and customs of the people, present resources of the country and glorious prospects of the future, are mingled with beautiful and elegant descriptions of wide-spread prairie-land, stretching far beyond the reach of human ken, with its tall "grass nodding and waving in the wind"—of the grand, primeval forests with their ever varying hues—of the clear, sparkling, inland lakes, glittering like gems in Nature's casket and filled with the richest flavored of the finny-gens, and of its glorious rivers, dotted with the "white-winged messengers of commerce" flying onward with wind-like speed to their destined port. All these various communications have everywhere found willing readers and doubtless accomplish the object whereunto they were sent.

Yet, while I would not be understood as speaking disparagingly of such, as far as my own personal knowledge goes the greater portion have been written (some few with the characteristic haste of Young America,) while traveling through the country, only on the great thoroughfares, and that too, with almost lightning speed. Thus it may be readily seen, that, though what has been written, is literally true, the "half has never been told." It is perhaps needless to affirm here, that in order fully to judge of the character, manners and customs of a people, one must needs settle among them, and mingle with them from day to day, which will give him an opportunity to behold the various aspects of every-day life: nor can the agricultural prospects of a country be better understood than by him who carefully tests the soil, or who, with slow and steady step visits not only city, but humble village, and travels the "by-ways" as well as the "high-ways." I long to hear more from such men, as by their very circumstances they are best fitted to communicate in regard to these interesting topics.—Of this class though I cannot claim to be, yet a residence for a few months has not failed to disclose new truths and dissipate preconceived opinions: and such no doubt will be the case with all whose opinions have been formed by flying reports. And now, by the way—a short description of the place where I have been spending a few months, may not be unwelcome to some of the readers of the Rural.

Ionia (if not of ancient celebrity, yet of ancient name,) is a quiet, beautiful little village—the county seat of Ionia county, Michigan, pleasantly located on the north bank of Grand River, about eighty miles from its mouth. Like all the villages and cities of the west, it is stamped with the unmistakable evidences of recent origin and rapid growth. But a few short years ago, and here the old forest trees, made music to the passing winds, heard only by untutored ears, and the wild deer roamed unscared among the dense thickets and grassy glens, except when the stealthy step of the red man drove him from his covert. The forest has disappeared like magic, and upon its green roots was planted the embryo village—a snug log cabin, with its broad, blazing hearth—and this, in turn has given way to the neat white cottage, surrounded with its pretty garden with numerous evidences of taste and refinement. At a suitable distance on all sides, stands the aged forests like sentinels, to guard the inhabitants from the piercing winds of winter, and the bitter, biting cold. Thus and so chary is Nature of all her children. The village now numbers about eight hundred inhabitants, and is rapidly increasing in wealth, enterprize and population. Tho' many new buildings have been recently erected and other are in the course of construction—yet the demand for vacant houses is much greater than the supply, and thus great inconvenience is felt by those who have failed to make previous arrangements. There is the usual complement of dry goods stores, groceries, mechanic shops, taverns and grog-shops!—*No! not a grog-shop in all the village*—thanks to the Maine law—yet, perhaps, it would be no more than just to say, that though spirituous liquors are not *openly* sold, still those who have been in the habit of using them, know where to find them. Conversing a short time since with an old "whiskey toper," he assured me there had not been only three days in which he had not been supplied with the "needful." This much I think can be said for the good effects of the Maine Law in Michigan,—in many places it has destroyed that open rioting and drunkenness that would not permit the sober man to walk the streets in peace, and still further, it suffers not the quiet and sacred stillness of the Holy Sabbath to be disturbed by shouts of drunken revellers.—Should it eventually accomplish no more, it has achieved a glorious triumph. S. A. Z.

Ionia, Michigan, Nov., 1854.

An Infernal Machine.—A leather valise was left in the bar room of the Earle House, New York, Friday morning. About two o'clock, it exploded making fearful havoc with furniture, &c., and badly wounding two men. On examination it appeared that the valise contained a small keg of powder, with which a double-barrelled pistol was connected by machinery, which was set so as to fire the pistol at a particular hour. It worked as its Swedish inventor desired. It is only strange that many others were not injured.

Literary Notices.

"The Pride of Life." By Lady Scott, author of "The Hen-pecked Husband." New York: H. Long & Bro.

With a well-sustained interest, and a good moral, this novel will be likely to please the lovers of real pathos and genuine humor. Sold at Dewey's.

The Westminster Review, for October, closes the 62d volume. It contains articles on the Odin Religion, the Greek People, Rajah Brooke, History—its Uses and Meaning, Women in France, the Sphere and Duties of Government, the Rise and Progress of Diplomacy, the Crystal Palace, and Notes of Contemporary Literature—English, American and Continental. Published by L. Scott & Co., New York. D. M. Dewey, agent, Rochester.

Foreign Intelligence.

Arrival of the Arabia.

The Arabia arrived at New York Nov. 3.

A private dispatch from Bucharest, of the 15th of October, announces the bombardment of Sevastopol commenced on the 13th. Two hundred pieces of heavy artillery were employed. Sevastopol was not expected to hold out more than three or four days.

Thirty thousand Russians had crossed the Danube into the Dobroudscha; and 12,000 Russians under Uschakoff occupied the Danube ferries near Toultsch.

Reports had again been circulated simultaneously in Vienna, Paris and London, of the fall of Sevastopol, and large stock operations are said to have been made on the faith of the statement, but the public were slow to believe. Government employees say that serious intelligence must not be looked for before the beginning of November.

Odessa accounts of the 8th ult., say that Gortschakoff was at that place, and that Menschikoff, who could not maintain his position at Bakshirai, had sent his army to Sevastopol, and gone to Perekop.

It is said Canrobert has notified the French Government that the allies' position is impregnable, being defended by 80,000 men, with 200 guns, and could easily be held against 200,000 Russians. On the 12th an attack was made by the Mahmoudin Turkish flag-ship of 120 guns, and several of the allied ships on Fort Constantine, but it was merely to cover the advance of the allies along the landward side of the city.

In consequence of correspondence found in Menschikhoff's effects, captured at Alma, several important arrests have been made at Varna.

Two small British steamers have been ordered to the Sea of Azof to bombard the town of Kertch.

Lord Stratford has succeeded in procuring a firman to suppress the trade in Circassian and Georgian slaves.

Northern Europe.—A large portion of the French fleet had returned to Cherbourg. A rumor was current that the Danish government had permitted the British fleet to winter at Kiel.

The Journal of St. Petersburg of the 14th contains a telegraphic despatch from Vienna, stating that the Commissioners of the Western Powers, and of Austria and Turkey, had met at Constantinople to arrange the question of protectorate on the basis of proposals made by the Austrian Cabinet.

The British Parliament is further prorogued to the 16th November. The papers publish a full list of the private soldiers killed and wounded at Alma.

The national subscription for the sick and wounded reached £6000 sterling, and a regiment of women nurses had been ordered to Scutkay.

The court martial of Sir Edward Belcher had terminated. In the case of Capt. McClure and the other officers tried, the verdict was that they are honorably acquitted, and in each instance their swords were returned with a complimentary remark. In the verdict on Belcher the word honorable was omitted, and his sword returned in silence.

France.—Nothing of political intelligence from France.

Spain.—The ministry have abandoned the project of drawing up a constitution to be submitted to the Cortez.

Latest News, Paris, Friday morning.—The Pharamound, arrived at Marseilles, brings additional news from Constantinople to the 10th and Balaclava to the 9th of October.

The seige works were covered with entrenchments against attacks from without. Prince Menschikoff had not made any offensive movement. The seige material amounted to 300 guns. It was thought that a breach would be made in forty-eight hours.

Balaclava was perfectly fortified. Russian deserters stated that Prince Menschikoff had received no reinforcements. The Prince says that the Turkish Ambassador at the Court of Vienna, Arik Effendi, had official command from the Austrian Cabinet, and that Omer Pasha will begin offensive operations against Bessarabia shortly, and will arrive at Bucharest in a few days, in order to arrange there his plan of attack with the imperial generalissimo. It is said that Lord Raglan has called on Omer Pasha to hasten his movements.

The Moniteur confirms the intelligence of a sortie attempted by the garrison of Sevastopol, and that they had been repulsed. Large Russian reinforcements were going to the Crimea by forced marches.

Breadstuffs.—B. C. Keer's board circular says:—Wheat has been in good request, and buyers have had to pay an advance of 1s. sterling per 70 lbs. on all descriptions.

Flour has been more sparingly offered.

Brock's Monument.—The Niagara Falls *Gazette* has the following:—

Workmen are busily engaged re-building Brock's Monument, on Queenston Heights. It is placed a short distance from the former site, nearer the brow of the mountain, and in a more conspicuous position. We judge from the view obtained from the American side that it is to be once larger and more beautiful than the old one. We understand that it is to be constructed with a room in the base for the accommodation of a family who will be present to show visitors and take care of it. The rebuilding of Brock's Monument does honor to our Canadian neighbors.

Marriages.

In Camillus, Oct. 31st, by Rev. Wm. D. Hadden, Rev. A. L. Freeman and Miss Margaret E. Bingham

Commercial.

Business and Finance.

There has been no import of specie during the week. The out-going steamers, Africa and Washington, have taken to Europe $1,040,035, making a sum total for the year of about $35,000,000.

The amount of specie in the United States Treasury subject to draft on the 26th ult. was $20,048,000.

There has been a great decrease of imports for the past few weeks, compared with those of the same time last year. The *Tribune* says, the imports of Dry Goods in October, thrown on the market, were $2,585,190 against $4,160,149 same month last year, a decrease of $1,474,959. The aggregate for the year thus far is $74,253,788, against $80,-$12,566, showing a decrease of $3,440,932.

Every kind of business is unusually dull and heavy for the season, and the money market very stringent. Real estate in New York is falling daily, both in fee and rents. It is stated that stores which a year ago rented at $8,000, now go begging for tenants at one-half that sum. Unless there is some letting up of the screws, of which indeed there seems to be little prospect at present, we may look for more heavy failures among business men and speculators. A telegraph dispatch from New York, dated Nov. 4th, says,—"Jacob A. Westervelt, our present Mayor, failed to-day. His liabilities are very heavy."

Stocks are depressed, and may be expected to remain so until easier times. New York Central sells at 87, Mich. Central do., Erie 44, and others in proportion.

Market Intelligence, &c.

Rural New-Yorker Office,
Rochester, Nov. 8, 1854.

Breadstuffs continue to advance in our market, and Flour may be quoted to-day at $10,50. Wheat brings readily eighteen shillings, and some lots have been sold three cents above that figure. Barley has also again advanced, and is now worth, delivered at the Breweries in this city, $1,12½ per bushel. Other grains as quoted last week.

There are no other essential changes, except that hay is a dollar on the ton higher, and poultry one cent a pound lower than last quotations.

New York Market—Nov. 6.

Flour—Medium and common grades of State dull and lower. Western scarce and in fair demand at full prices. Yankee and extra Ohio at early important change. Demand not very active. Receipts of common State much larger. Sales at $8,31½@8,62½ inferior to straight and favorite State; $8,81½@9,12½ com. to good Ohio, Mich. and Wis.; $9,50@10,50 extra Ohio; $10,50@11,25 extra Genesee. In Canadian we hear of no transactions to report.

Grain—Receipts of wheat increasing, and holders are compelled to accept rather lower prices. We do not, however, notice any material decline. Sales good white Southern at $2,15, white Wis. at $2,10. Rye in good distilling demand, and market firm. Sales at $1,08 in Buffalo, the seller to deliver it in New York, and the buyer to pay all expenses. There were also sales on the spot at $1,50. In Barley we hear of no operations. Good parcels scarce, and firmly held at $1,40 and thereabouts.

Provisions—Demand for Pork quite active, being confined principally to the wants of the trade, and with large supply offering. Sales at $12,50 mess; $11,25@37½ prime; $12@12½ thin mess; $17,12½@23 sour do.; $13 for clear. Dressed Hogs in good demand for packing market, and firm at 5@5½c.

Albany Market—Nov. 6

Flour—We notice a good degree of firmness in Western and State Flour, with a moderate home and an improving eastern demand. Sales at $8,75@9,50 for com. to good State and Western; $9,50@10,00 for good to fancy State, and $10,00@11 for extra Genesee. Buckwheat flour is rather firmer, and is selling at $3,87@4,25 per 100 lbs.—Corn meal is firmer, and is selling at $1,69@1,75 per 100 lbs.

Grain—There was a good supply of wheat upon the market, which is held above the views of buyers. Some parcels are held above their present market value, and unless they are sold at the restricted prices will go into store. No sales are made. Corn has further improved in value, with only a moderate amount offering. Sales Western mixed, afloat, at 81@82c, the latter price for a part of a cargo. Barley continues to rule dull, but prices have undergone no important change since our last. Oats are very quiet at 50@52c for State.

Buffalo Market—Nov. 6

Flour—The receipts continue fair, but the stock in store is not rapidly accumulating. The demand is good this morning, and the market remains at our last quotations, with firm holders for the better descriptions. Sales at $8,50@8,75 for choice to extra brands Ohio, Ind., Mich.

Grain—Receipts of wheat are large, and the supply is now ample, particularly of Upper Lake. Inquiry good to-day, and we do not change our figures. Sales Milwaukee mixed at $1,58, and white Mich. at $2,07. Corn quiet, in consequence of the firmness of holders. Receipts moderate; sales at 70c. Oats in good supply and very limited inquiry. In Rye and Barley nothing doing. Supply of both light.

New York Cattle Market—Oct. 30.

At Washington Drove Yard—Offered to-day 2,307 Beef Cattle; during the week 2,413 Prices—Beeves range from 6 to 9½c per lb. Cows and Calves, $30 to $45.—Veal Calves, $4 to 6 Swine, corn fed, $4,00@4,37. Sheep (on foot) from $2,00 to 6. Lambs, $2,00 to 5.

At Brownlow's—At market, 500 Beef Cattle, 40 Cows and Calves, 50 Veals, 8,000 Sheep and Lambs. Prices—$6@9,00 per 100 lbs. for Beeves; Cows and Calves range at from $25 to $50. Veals sold at from 4½@6c per lb. Sheep range at from $2,12 to $6,50. Lambs, $1,00 to $4,50.

At Chamberlain's—At market 595 Beeves, 125 Cows and Calves, 108 Veal Calves, 8,468 Sheep and Lambs.

Prices of Beef ranged at from $7,00 to $9,00 per 100 lbs. Cows and Calves at from $20 to $50. Veal at 5@6½c per lb. Sheep $2@$6. Lambs $1,75@4,50

At O'Brien's—Sales of Beeves at $7@9,50 per 100 lbs. Cows and Calves at from $25 to $40. Veal 5@6½c.

Cambridge Cattle Market.—Nov. 1.

At market 1,788 Cattle—about 1,000 Beeves, and 788 Stores; consisting of working oxen, cows and calves, yearlings, two and three years old.

Prices—Market Beef—Extra $8,00 per cwt.; 1st quality, $7,50; 2d do, $6,75@7; 3d, do, $6@6,50; ordinary, $4,00@5. Hides, 7 cwt. $4,50@6; Tallow 6½@8,25; Pelts 42@75c. Calf Skins, 11c ₩ lb.

Barrelling Cattle—$6,25@7,25.

Veal Calves—$7, 8@9.

Stores—Working Oxen—$114, 144, 150@175.

Cows and Calves—$24 to $42@44. Yearlings, $9 to $10@11. Two years old—$12 to $21@26. Three years old, $25 to $32@48.

Sheep and Lambs—4,283 at market. Prices—Extra—$4 to $4@7. By lot—$2,00 to $3@3,50.

Swine—All large hogs, still fat, at 4½, and hard hogs 4¾c per lb.

Brighton Cattle Market—Nov. 2

At market 1,600 Beef Cattle, 1,000 Stores, 6,000 Sheep and 2,100 Swine.

Prices—Beef Cattle—Extra, $7,75@8,25; first quality, $7,25@7,50; 2d, $6,50@7,00; 3d, $5,25@6,25.

Working Oxen—Sales $90 to $148@160.

Cows and Calves—Sales $23 to $42@50.

Stores—Yearlings $7@10; two year old $15@20; three year old $30@32.

Sheep and Lambs—Small lots, $2 to $3,12@4,75.

Swine—Still fed fat hogs, 4½@5c; corn fed, 4¾@5½c; large store hogs, 4½@5½; shoats to peddle, 4¾; at retail, 4¾ to 6c.

Advertisements.

Advertisements inserted in the Rural New-Yorker at 15 cents a line, each insertion,—*to be paid in advance.*—Brief advertisements preferred, and we do not wish to give any one more than four successive insertions. Our space is limited, and we wish to accommodate and benefit as many applicants as possible,—at the same time interesting our readers by presenting something new, weekly.

TRACY FEMALE INSTITUTE,

No. 31 Alexander street, Rochester, New York.

The next quarter in this Institution will commence on Wednesday, Nov. 15, 1854. Circulars may be obtained of 253-1t* Lucilia Tracy, Principal.

ROCHESTER MAP DEPOT.

J. H. Colton & Co., of New York, the most celebrated Map publisher in the U. S., have opened a Depot in Smith's Arcade, No. 20, East Entrance, opposite the Eagle Hotel, for the sale of Maps of every description, Gazetteer of the U. S., (late work,) Progress of the U. S., Guide Book, Western Tourist, Route Book, Western Portraiture, Statistical Annual, Comprehensive Geography, American Atlas, Atlas of the World, &c., &c., all of which will be sold at the Company's prices in New York, without adding transportation.

A number of efficient agents wanted immediately, to engage in selling the above named works in Western and Central New York. Great inducements offered.

(50) R. G. MURRAY, General Agent.
Rochester, Oct. 28, 1854. 253-01

SHORT-HORNS FOR SALE.

I have several bull calves for sale, (two of them from Grat Prevalent cows,) and all sired by my first premium Bull Halton (11532.) I can also spare a few heifers, and heifer calves. The prices will range from $200 to $500.

253-tf S. P. CHAPMAN,
Mount Pleasant Farm, Clockville, Madison Co., N. Y.

A SMALL FARM FOR SALE.

R. M. Walker will sell his Farm of 57 acres of good land, adjoining the grounds of Grand River Institute, *Manual Labor School*, in Austinburg, Ashtabula Co., Ohio.—There are about three acres of valuable orcharding on it, a good house and barn, abundance of timber, and it lies within five miles of the *Lake Shore Railroad*, and half a mile from one under contract, leading to the Coal fields of Eastern Ohio. Price $2,100. Address the owner at Westerville, Franklin Co., Ohio, who offers his home thus low because his business takes him from it. 253-1t*

200,000 APPLE SEEDLINGS—two years growth—for sale by James Drake,
252-3t* Elba, Genesee Co., N. Y.

CARLISLE SEMINARY,

(MALE AND FEMALE.)

Rev. JAMES DOUGLASS, A. M. Principal,

Assisted by a large corps of able and experienced Teachers, filling every department of instruction.

This Institution is located at Carlisle, Schoharie Co., N. Y., 30 miles west from Albany, and 12 miles south of Canajoharie. The buildings are new and of sufficient capacity to accommodate over 300 boarders. They are situated in the midst of a beautiful grove of some ten acres of ground belonging to the Seminary.

Carlisle is a pleasant, healthy, and retired village, and contains no hotels, saloons or groceries where intoxicating liquors are sold.

INTERNAL ARRANGEMENTS.

There are six large recitation rooms, six music rooms, a commodious chapel, rooms for library societies, a reading room, library, a large and convenient room for Oil Painting with sky and side lights, bath rooms in connection with each department; and five flights of stairs all connecting with outside doors and accessible from any part of the building, thus affording ample opportunities of escape in case of fire. The whole is warmed by furnaces in the basement, thus obviating the danger and inconvenience of having stoves in the rooms—but at the same time keep in equal temperature throughout the halls and rooms. Students are never exposed to draughts of cold air, as they are not required to go out of the building in passing to the recitation rooms, chapel or dining hall. The rooms of the students vary in size from 10 by 14 feet to 15 by 16 feet, and are furnished with a movable register in the floor, and also with a ventilator, by which means each student may graduate the temperature of his own room at pleasure. In addition to the above conveniences, the Institution employs servants to carry water to and from the several halls, trim the lamps and do the extra cleaning of the Students' rooms.

BOARD.

We intend the board shall be decidedly superior to that which is afforded in other boarding schools, thus removing the reproach too often, in many cases too justly connected with them.

BOARD OF INSTRUCTION.

In the selection of Teachers, the Trustees have spared neither pains nor expense. Every department of instruction is filled by Teachers of superior qualifications—experience and success in their profession. Students completing a prescribed gradulting course will receive Diplomas.

DISCIPLINE.

The students of both departments are under the constant supervision of the Principal, Preceptress and Teachers—all of the same table with them, are accompanied by them to church and on their excursions, and are instructed concerning the social proprieties as well as the duties and obligations of life. No intercourse whatever is permitted between the two departments except in the public parlor with the permission of the Principal and Preceptress. No gentleman is allowed to visit a lady in her private room.

EXPENSES.

Board, with washing, bed, and room, furnished with good mattress bed and bedding, table, chairs and stools, wash-stand, wash-bowl and spittoon, water-pitcher, lamps, window curtains, clothes-screen, pail, lights, consisting of lamps already trimmed, &c., per week, . . . $2,00

TUITION GREATLY REDUCED.

Tuition for all branches, including the Higher Mathematics, Algebra, Geometry, Surveying and Civil Engineering, Ancient and Modern Languages, per quarter, . . . $5,00

EXTRAS.

Lessons on Piano Organ or Melodeon, per quarter,	8,00
Use of Instrument,	2,00
Lessons on Guitar,	8,00
Use of Instrument,	2,00
Lessons on Violin,	5,00
Oil Painting,	6,00
Drawing and Painting (in water colors) each,	3,00
Grayoning, Monochromatic and Grecian Painting,	3,00
Ornamental Needle Work and Worsted Flowers, each,	3,00
Ornamental Leather Work,	3,00
Papier Machie, (materials furnished,)	5,00
Shell Work and Tissue Flowers, each,	3,00
Wax Fruit and Flowers,	4,00
Pastel Painting,	4,00
Vocal Music,	1,00

All bills must be paid in advance at the commencement of each quarter.

TERMS AND VACATIONS.

The academic year is divided into two terms of twenty-two weeks, and each term into two quarters of 11 weeks each. The next quarter commences on the 23d of November—continues 11 weeks, and is succeeded by a vacation of two weeks. The second term commences on the 22d of February, continues 22 weeks, and is succeeded by a vacation of six weeks.

CONVEYANCE FREE.

On the 22d of November, at the commencement of the next quarter, Students will be received at Palatine Bridge or Canajoharie and carried to Carlisle free of expense.—Students are received at any time during term—new classes being formed as circumstances require, and are charged tuition only from the time of entering.

An express leaves Canajoharie for Carlisle on Tuesday, Thursday and Saturday of each week at 4 o'clock, P. M.—A stage (the Cherry Valley stage) leaves Albany, corner of State street, and Broadway, Museum Buildings, at 7 o'clock A. M. on Monday, Wednesday and Friday of each week, arriving at Carlisle in the afternoon of the same day.

S. P. SHIBLEY, Pres't.
Geo. Brown, Sec'y. 252-3t

MINNESOTA! MINNESOTA!! MINNESOTA!!!

The Rural for 1855.

OVER $700 IN CASH PREMIUMS!

Post-Masters, Agents, Subscribers,

And others who wish to benefit themselves, and promote the interests of community, are respectfully invited to note a brief announcement,—one which is, we confidently believe, most worthy their best attention. After bending low in grateful acknowledgment to Post-Masters, their Assistants, Agents and Subscribers, whose exercise of influence has enabled us to render Moore's Rural New Yorker the *first* Journal of its class in Circulation, Influence and Popularity, we desire to communicate, in a few words, the substance of a Prize List which *far exceeds*, in both *numbers* and *value*, any of its predecessors. Relying upon *acts* rather than *words*, we proceed without circumlocution or palaver, to invite your attention to the following list of splendid Cash

PREMIUMS FOR SUBSCRIBERS:

ONE HUNDRED DOLLARS for the largest list of Yearly Subscribers to the Rural New-Yorker—the payment to be remitted according to our Club terms, previous to the 1st day of February, 1855.

EIGHTY DOLLARS for the next (second) largest list, as above specified.

SEVENTY DOLLARS for the third list.

SIXTY DOLLARS for the fourth list.

FIFTY DOLLARS for the fifth list.

FORTY DOLLARS for the sixth list.

THIRTY DOLLARS for the seventh list.

TWENTY-FIVE DOLLARS for the eighth list.

TWENTY DOLLARS for the ninth list.

TEN DOLLARS to each of the *five* persons sending the 10th, 11th, 12th, 13th, and 14th lists, as above.

FIVE DOLLARS to each of the *five* persons sending the 15th, 16th, 17th, 18th, and 19th lists.

THREE DOLLARS to each of the *six* persons sending the 20th, 21st, 22d, 23d, 24th, and 25th lists.

☞ We also offer the following very liberal list of

CHRISTMAS CASH PREMIUMS.

FIFTY DOLLARS for the largest list of subscribers to the Rural New-Yorker, sent in or mailed according to our terms, on or before the 25th day of December ensuing, (1854.)

THIRTY-FIVE DOLLARS for the next largest list, as above.

TWENTY-FIVE DOLLARS for the next list.

FIFTEEN DOLLARS for the next list.

TEN DOLLARS for the next list.

FIVE DOLLARS for the next list.

☞ Persons competing for Christmas Premiums are not excluded from the February prizes, so that one person may secure *One Hundred and Fifty Dollars, in Cash!*—another *One Hundred and Fifteen Dollars*, &c.

(In order to give Post Masters, Local Agents, &c., a fair and equal chance, travelling agents, publishers and editors of Rochester are excluded from competition for any of the above Premiums.)

SPECIFIC PREMIUMS.

In order to reward every person who may aid in extending the circulation of the Rural New-Yorker, we offer to such as do not compete for any of the preceding Premiums, the following liberal gratuities for subscribers forwarded *previous to the 1st of April, 1855*:

THREE DOLLARS, in Books, or a handsomely bound volume of the Rural for 1854, for THIRTY subscribers.

To every one remitting for twenty copies ($25,) an extra copy of the Rural and either volume of the Wool Grower and Stock Register—or, The Horticulturist for 1855.

The same premium to every one remitting for FIFTEEN copies, ($20,)—for TEN copies ($15.)

To every one remitting for six copies ($10,) an extra copy of the Rural, or the Horticulturist for 1855.

For $5 we will send THREE copies of the Rural, and either vol. of the Wool Grower and Stock Register.

For $4 we will send one copy of the Rural, and either *Putnam's, Harper's, the Knickerbocker, Lady's Book*, or *Graham's Magazine* for one year.

For $3, we will send a copy each of the Rural and the Horticulturist for 1855.

All competitors for premiums are expected to adhere strictly to the following

TERMS, IN ADVANCE:

Two Dollars a Year. *Three Copies, one year, $5—Six Copies for $10—Ten copies for $15—Fifteen Copies for $20—Twenty Copies for $25, and any additional number at the same rate.* ☞ *As we are obliged to pre-pay American postage, our lowest Club price to Canadian subscribers is $1,50 per copy.* ☜ *To facilitate mailing, we prefer sending Club papers to one address at each post office, but the names of subscribers will be written on the papers if desired. Club papers sent to different post offices, and names can be sent in at different times. Bills of all specie paying Banks received at par on subscription.*

☞ Specimen numbers, show-bills, prospectuses, &c., sent free to all disposed to compete for the Premiums, or who desire to extend the circulation of the New-Yorker. Subscription money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. Moore,
Dec. 1854. Rochester, N. Y.

BUFFALO SEED AND AG'L WARE-HOUSE,

No. 196 Main street, Buffalo, N. Y.

Emery's Horse-Powers, Threshers and Separators,
Seymour's, Pennock's and Rose Grain Drills,
Hickock's and Bailey's Cider Mills,

Together with a full assortment of Hay Cutters, Plows and other Implements, always on hand, at lowest market rates.

N. B.—Country dealers supplied on liberal terms.

244 H. C. Wilde & Co.

CHEMICAL ANALYSIS.

J. Bryan, Practical Chemist, 112 State St., Rochester, N. Y., is prepared to make *full and accurate* analysis of Minerals, Soils, Metals, Mineral Waters and Chemical Compounds, and articles suspected of adulteration and Poisons, either organic or inorganic, and in quantity or quality. It is necessary to send one or two ounces of a solid, and a pint or more of a fluid for examination. 241-12t

HOME PROTECTION.

Thirst Insurance Company, Capital $250,000, Organized December 24, 1852; Chartered March 1, 1853. Homes only insured by this Company. No one risk taken for more than $3,000.

Many distinguished persons have insured their bodies, to the amount of $3,000 each, in this Company, among whom are Ex-President Van Buren, Kinderhook; Ex-Governor Seward, Auburn.

Auburn, May 16th, 1853.

To whom it may concern.—We are personally acquainted with many of the Officers and Directors of the Thirst Insurance Company, located at Meridian, Cayuga Co., N. Y. In our opinion they are among the most wealthy and substantial class of Farmers in this county.

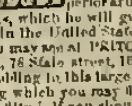
J. N. Sparks,
Elmore P. Ross,
Thomas Y. Howe, Jr.

The above gentlemen will be recognized as the Cashier of Cayuga County Bank, Auburn; Postmaster, Auburn, and Ex-Member of Congress, Auburn, Cayuga County.

N. B.—The public are cautioned to bear in mind the name, (*Thirst,*) and not submit to an imposition daily practiced by two-by-four Mutual Co's.

T. H. Tuby, Secretary.
234-tf

TRUNKS AND VALISES.



The subscriber would inform the citizens of Rochester and the public generally, that he is manufacturing extensively, a very superior article of sole leather and steel spring Trunks, which he will guarantee to be equal to anything made in the United States.

You may see at Pritchard's Trunk Depot and Sales Room, 78 State street, 1850 Trunks and Valises, and he is now adding to his large stock from 125 to 150 per week—among which you may find Trunks varying from one dollar to fifty. If you should want anything in the line, give him a call, for his motto is, "Large sales and small profits."

A. H. Pritchard, No. 78 State St.
Rochester, N. Y., Aug. 1854. 240-tf

Poetical.

[Written for the Rural New-Yorker.]

"WE SAIL UPON A SUMMER SEA."

BY J. H. MICHEN.

We sail upon a summer sea,
With soft blue skies above—
An airy, fairy bark within,
And piloted by love.
The waves before our golden prow
Dissolve to pearly spray,
As, swift before the singing breeze,
We gaily glance away.

Adieu, adieu, ye rosy bowers
Where in our youth we met
To gather flowers, whose glossy leaves
With shining dews were wet.
Sweet morning land! thy happy shore
Is growing faint and dim,
A vague, uncertain line of light
On the horizon's rim.

Beyond that line so dimly seen
Above the waters blue,
Are scenes we saw and learned to love
When life with us was new—
Are countless things which we behold
With ever new delight—
Things overhead hung, which now have passed
Forever from our sight.

Away, away, no vain regrets,
For what is left behind;
Forgetful of the sunny Past
And to the Future blind,
We sail upon a summer sea
With soft blue skies above,
An airy, fairy bark within,
And piloted by Love!

Chardon, Ohio, 1854.

Rural Sketch Book.

[For Moore's Rural New-Yorker.]

THE STUDENT'S CAREER.

A TALE OF EVERYDAY LIFE.

BY EDWARD WEBSTER, ESQ.

Impending difficulties, to the man who exercises a prudent foresight, usually appear much more formidable than they prove in fact. The very state of mind which causes a man to discover obstacles while they are yet afar off, engenders a habit of foreshilling them, or of preparing himself to take advantage of any loophole which may present itself for escape when the obstacle can no longer be avoided. The experience of every person will readily suggest to him innumerable instances where the inevitable failure of some cherished scheme stares him in the face; when an impassable wall seems to tower up across his way which it appears impossible either to flank or to go over; yet, when the formidable obstacle is finally approached, a means of escape presents itself unexpectedly to view. Even if the cherished object has to be abandoned at last, however much the matter may be regretted at the time, it not unfrequently turns out that another presents itself in lieu thereof which in the end proves even more fortunate than the first one promised. People sometimes repine at ill success, and afterwards, when more light is thrown upon the subject, have reason to thank God for the very disappointment over which they lamented. If a man falls prostrate in an encounter, let him rise with a courage undaunted for a second trial. Success will usually come at last, or if it do not come, far better is it,

"To feel the lightning's shock
Than perish piece-meal on the rock."

Very few will perish, however, if they call into earnest action all the powers God has given them; clouds will lower, darkness will overshadow them, but the full glory of a cloudless sky usually succeeds the blackest tempest.

Solomon Williams, the hero of our story, (if hero he may be called,) was not born with a silver spoon in his mouth; neither did he claim a long line of honorable ancestry, as is not unfrequently done when the descendant has himself no merit of which to boast.—Neither was the career of Solomon himself one of a startling or uncommon character. His struggles, reverses and disappointments, his triumphs and humble successes, are but a transcript of the every day experiences of human life; and we warn the reader in the outset, that he need look for nothing in Solomon's history out of the ordinary events of common humanity. He grew up to early manhood with brothers and sisters in a humble household, attended a district school with them and the neighbors' children, without any remarkable developments above the general run of boys. Like every other young man, Solomon had aspirations, day-dreams of greatness, longings to rise in the world and to show the community in which he lived that he, as well as others, was capable of some great achievement. What that achievement might be he had no very definite idea; a great poet, a great painter, a great orator, a great statesman, presented themselves to his imagination, each in turn. He tried his hand at versification, but his measures halted, his feet were out of joint, and his rhyme was faulty. The editor of the village newspaper rejected his most cherished production. He essayed in secret a few amateur pictures; but in order to distinguish one from the other or eliminate the painter's idea, an outsider would have required a label on each, such as "This is a horse"—"This is a dog." So the pictures were very properly committed to the flames. He spoke once, or tried, in the village debating society, but the audience yawned and the president went to sleep in the course of his remarks—He attended weekly, during a hot political campaign, at the club room of one of the parties, and once attempted a stump speech which he had committed, as he supposed, to memory; but forgot it on the stand, and retired in confusion, after giving utterance to half a dozen confused sentences.

People must not suppose from these illustrations that Solomon Williams was a fool, or lacking in common sense. He was naturally shrewd enough, and promising enough. His were only the failures of an undisciplined mind, the crude workings of an untrained intellect, that will ever be attended with the like results. Gold must go through the fire to become refined; it may be the fire in the laboratory of the chemist, or that of the deep blazing surges of the volcano; and the mind may become disciplined in the schools, or in the severe conflicts of human life.

Solomon followed the plow for a living, at least through his earlier years, and until an event occurred that changed the whole current of his subsequent life. That event was a love affair, as he himself is accustomed to declare; and when narrating it, even at this day, is as enthusiastic as if he was even now indulging in "Love's young dream."

"There was heaven," says Solomon, "in her mild blue eye! I never imagined until I saw her that I was blessed with the vision of an angel in human form. That was the poetry of human life, to be followed by long years of trying and struggling prose. She came to our house the first time I saw her with a mutual friend, on a visit to my sisters; and the impression she made on me at that time has not been effaced to this day. It was on a Sunday afternoon they called, when the glory of an Indian Summer was at its height, and we all took a walk together down beside the brook, previous to attendance at an evening meeting in the school house. There were half a dozen of us together, and Bess (that was what they called her) walked with me. I pulled up a mullein stalk crooked at the root in the shape of a convenient walking stick, and made room for her tiny hand upon the handle. We somehow got separated from our companions in the ramble, and as our hands met upon the crooked root of our rude walking stick, the touch of her fingers thrilled over me like a spark of electric fire."

Solomon, by his own confession, was a lost man, so far as a sound heart was concerned. He managed to meet his charmer several times before she left the neighborhood, and was received by her with a good deal of favor—so much, indeed, that it emboldened him to obtain a promise to answer a communication he might send her through the mail. The lover's dreams, as is usual in all such cases, were of a very blissful character. His letters were promptly and delicately answered, and he at last mustered courage sufficient to visit the neighborhood of his lady love, for the purpose of calling on her. His reception was flattering indeed, and, prompted by his success, he made bold to ask permission to repeat his visits at stated times. Fearing, however, the effect of too great pressure for an immediate answer, he requested her to think of it for a couple of weeks and then reply to him by mail. Confident of success, the youth passed the blissful interval in anticipation of a favorable answer, and was taken aback by an unfavorable one, like a ship under full canvass when struck by an adverse squall.

The idea then flashed across his mind for the first time that he had been victimized; led on in the seductive mazes of a lover's dance just to be shoved to the wall at the end of the figure and laughed at for his folly. Honest of purpose himself, straightforward and upright in intention, this false play on the other side was as unexpected as it was galling.

"I'll see her," he said, "and learn from her own lips the truth, if possible; and if she has been trifling with me, then farewell to all these dreams! I will forswear the sex forever, and betake myself to some pursuit that at least shall secure my own self respect. The ungrateful minx, to use me in this way! I would have suffered martyrdom rather than have deceived a woman as I have been myself deceived!" So saying, he made early preparation to visit the town where the young lady resided, and putting on as much dignity and firmness as he could well command, sought an interview with her, and, without much circumlocution, entered upon the object of his visit.

"You answered by letter as was agreed upon between us," he began.

"Yes," responded the girl, patting with her pretty foot upon the floor.

"Forgive me for asking these questions," he said, "but I am desirous of a true statement from your own lips. Was your answer the dictated sentiment of your own heart?"

She hesitated a little, but gave him finally an affirmative answer, or at least one he understood to be such.

"Is there no probability of your thinking differently," he continued, with some manifestation of feeling in spite of himself.

"None, at least for the present."

"Then farewell," he said, rising; "I certainly have been misled; perhaps it was my own fault in being too credulous, but I will trouble you no more. Our journeys through life henceforth lay a wide way apart, and I should be sorry to look back upon one whom I have regarded as superior to most of her sex with any spirit of unkindness." So saying, he rose with more dignity than one would suppose him capable, and withdrew from the house; while Bess continued to gaze after his retreating figure with a moisture in her eye and a shade upon her fair brow, which seemed to belie the heartlessness of the coquette.

"Farewell to day-dreams now," mentally ejaculated Solomon. "I have been made a fool of by a girl—not the first one in this predicament I suspect—and my future life must make atonement for the follies of the past."

Solomon Williams had been left a small legacy by his grandfather, which now, by the accumulations of interest, amounted to several hundred dollars. He had just arrived at the period of majority, and had been paid off by the Trustees so "laying down the shovel and the hoe," he betook himself straightway to the academy, greatly to the surprise of all his friends, and commenced there another kind of conjugation than the one he had previously anticipated, viz, the conjugation of Greek and Latin verbs; and rather awkward work he made of it, at first. Rough in exterior and dress, unpolished in manners, and bashful withal, he was for a time a subject for the practical jokes of his fellow students; but his sterling good sense and propriety of conduct soon won him the respect of all. So rapid and efficient was his progress, that at the end of the preparatory course he was awarded the post of honor at the Commencement, and delivered the valedictory oration.

He was not a little elated at the preference awarded him, and still more so when his quick eye caught among the audience the sunny face of his quondam sweetheart; sunny but thoughtful, and full of apparent interest in the successful performance of his part. He exchanged salutations with her after the exercises closed, and was congratulated upon the merit of the performance.

"I leave," he said, "next week for college, and if successful in my examination and admittance shall be absent from home four years."

"That is a long time" she answered; "your friends will hear from you in the mean time?"

"Yes, occasionally, but I have chosen another mistress of my affections, who must henceforth receive my chief attentions."—Bess' countenance fell at the abrupt declaration, but cleared away again as he added: "That mistress is science, whose servant I have sworn myself to be henceforth." So they parted, he to enter upon his difficult and arduous career, rendered still more difficult and arduous by the pecuniary embarrassments that surrounded his path, and she to return home and brood over the lover she had lost, or console herself with another, as to her might seem most advantageous and desirable.

[*To be Continued.*]

SCENE IN A RAILROAD CAR.

The seats of the car were all occupied—Not wishing to disturb those who were seated, I was intending to stand, but a gentleman up at the far end arose and insisted upon my taking his seat. Being very tired, I thanked him and obeyed.

Presently a young lady, much younger, much prettier, and better dressed than myself, entered the car. No less than four gentlemen arose, instantly offering her a seat. She smiled sweetly and unaffectedly, and thanking the gentleman who urged the seat nearest to her, she seated herself with a peculiar grace of manner.

She had one of these faces Raphael was always painting—touching, sweet, expressive.

A little after this young beauty had taken her seat, a poor woman, looking very thin and very pale, with that care-worn, haggard look, that poverty, and sorrow, and hard labor always give came in. She might have been one of those poor seamstresses who work like slaves, and—starve for their labor. She was thinly and meanly clad, and seemed weak and exhausted. She had, evidently, no sixpence to throw away, and came into the car not to stand but to rest, while she was helped along in her journey.

While she was meekly standing for the moment, none of the gentlemen (?) offering to rise, Raphael's angel, with sweet reproving eyes, looked on those who had so officiously offered her a seat, and seeing none of them attempt to move, and just as I myself was rising to give the poor old lady a seat, she arose and insisted upon the woman taking hers.

It was all the work of a moment; and the look of grateful surprise the old woman gave her, and the glance of sweet pity the beautiful girl bestowed upon the woman as she yielded her seat, and the evident consternation of the broadcloth individuals, who were manifestly put to shame, all were to me irresistibly interesting and instructive.—*Day Book.*

Wit and Humor.

COUSINING.

A country gentleman lately arrived in Boston, and immediately repaired to the house of a relative, a lady who had married a merchant of that city. The parties were glad to see him, and invited him to make their house his home, as he declared his intention of remaining in the city but a day or two. The husband of the lady anxious to show his attention to a relative and friend of his wife, took the gentleman's horse to a livery stable in Hanover street.

Finally, the visit became a visitation, and the merchant, after the lapse of eleven days, found besides lodging and hoarding the gentleman, a pretty considerable bill had run up at the livery stable.

Accordingly he went to the man who kept the livery stable and told him when the gentleman took his horse he would pay the bill.

"Very good," said the stable-keeper, "I understand you."

Accordingly, in a short time, the country gentleman went to the stable and ordered his horse to be got ready. The bill, of course was presented.

"Oh!" said the gentleman, "Mr.——, my relative will pay this."

"Very good, sir," said the stable-keeper. "Please to get an order from Mr.——, it will be the same as money."

The horse was put up again, and down went the country gentleman to Long Wharf where the merchant kept.

"Well," said he, "I am going now."

"Are you?" said the merchant, "Well, good bye, sir!"

"Well, about the horse, the man says the bill must be paid for his keeping."

"Well, I suppose that is all right, sir."

"Yes—well, but you know I'm your wife's cousin."

"Yes," said the merchant, "I know you are, but your horse is not!"

Memoranda of an Accomplished Young Lady.—The *Buffalo Republic* says, we recently picked up the following memoranda, which we saw dropped by a young lady attired in an embroidered velvet Talma, an exquisite Hunilon lace collar, a white but not plume, and a painfully brilliant silk dress, with exaggerated flounces:

"I must get a—Vail, Brown hoes,
Sarcenet, Lutse,
Glove, Shimmyzet,
Kulone."

We confess we were startled at the last item, but think it means cologne. The whole simply proves that wealth and intellect do not always hunt in couples.

A fellow went to the parish priest and told him with a very long face that he had seen a ghost.

"When and where?" inquired the pastor.

"Last night," replied the timid man; "I was passing by the church, and up against the wall did I behold the spectre."

"In what shape did it appear?" said the priest.

"It appeared to be the shape of a great ass."

"Go home and hold your tongue about it," rejoined the pastor; "you are a very timid man, and have been frightened at your own shadow."

Teaching the Young Idea how to Shoot.—A lady on being told that a friend wished to see her, desired her little daughter, about eight or nine years of age, to say that she was not in; upon this the friend, being anxious to have an interview, asked the child when her mother would be likely to return. The little thing very innocently said, calling up stairs, "Mamma, the lady wishes to know when you will be in?"

"Sally Mander safe!" said Mrs. Partington, as her eyes fell upon an advertisement. "Do tell me, Isaac, who this Sally Mander is, and what she's been doing that they've got her safe."

"I don't know what she's been a doing," said Ike, "but I guess she's a sister to Jerry."

"Jerry who, Isaac?"

"Why, Jerry Mander," said Ike.

Accommodation.—Strict Business Man—"Patrick, hereafter I want you to commence work at five o'clock and quit at seven."

Patrick—"Sure, and wouldn't it be as well if I'd commence in the morning at seven and leave off at five in the evening?"

When Sarah Jane, the moral Miss,
Declares "'tis very wrong to kiss,"
I really think that I see through it;
The lady fairly understood,
Feels just as any Christian should—
She'd "rather "scuffle wrong than do it."

A youngster being chased by a cow, while on his way to school, ran into a thicket, and not returning home till late, was asked by his mother, "where he had been;"

"A cow hiding, ma!" was the precocious reply of the little fellow.

An Irishman being asked on a late trial for a certificate of his marriage, bared his head, and exhibited a huge scar, which looked, as though it might have been made with a fire-shovel. The evidence was satisfactory.

Old bachelors do not live as long as other men. They have nobody to mend their clothes or darn their stockings. They catch cold, and there is nobody to make them peppermint tea, consequently they drop off.

The snobs wear blue coats and brass buttons. The blue is indicative of their feelings; the brass of their manners.

Youth's Corner.

ILLUSTRATED REBUS. NO. 46.

☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 17 letters.
My 7, 16, 8 is a color.
My 2, 14, 5 is to cut.
My 4, 6, 1 is a drunkard.
My 12, 3, 10 is many.
My 9, 17, 11 is a conjunction.
My 13, 6, 15 is a plant.
My whole by turns controls and governs the world.

Rome, N. Y., 1854. C. E.

CHARADE.

The greatest contrasts mark my first—
'Tis praised, abused, the best, the worst;
Preferred before the good and great,
Yet with the beggar at your gate.
At Court admitted—oft with fear
Lest it should reach a monarch's ear;
Yet courts of law it much frequents
In search of law and precedents.
Good, vicious, false, and true—in brief,
Favors the plundered and the thief.
Is truth itself—a very lie,—
Loud laughed and silent in the eye,
Or gently whispers in a sigh
The lover's charm. O lady fair,
Of the known fall like sweet beware;
Yet should my first your lover make,
My second be, or second take
Pre-eminence first, then drop behind,
And the two things be nine combined—
Accept the promise of his tender,
And to his heart your heart surrender.

Answer to Enigma in No. 44.—*Dear.*

Messrs. Eds:—The answer given to Mathematical Question in No. 43, shows a remarkable combination of the Arabic numerals, but is not correct, inasmuch as the third number is not the "*sum* of two numbers," but a *product* of one number by another. Let me give you the following, which complies literally with the terms of the proposition:

4261538709
3058207641

82197-46350

SHEEP FOR SALE.

I have Sheep (both Bucks and Ewes) of the following breeds, for sale, at reasonable prices,—French and Spanish Merinos pure bred; also, crosses of the two breeds, from ¾ to ⅞; also, Leicester and South-Downs, pure bred, and crosses of the same. These Sheep are from or descended from the flocks of the well-known breeders of pure bred Sheep, Messrs. Jewell, Hurell, Atwell, Wakeman, Mallory, Brodie, &c. For further particulars address me (post-paid,) at Belleville, Jefferson Co., N. Y.

252-4mnow E. G. COOK.

EYE AND EAR INFIRMARY.

Dr. Walker, Oculist and Aurist, (from London, England,) may be consulted daily, and testimonials obtained at the office, 82 Main St., Rochester, N. Y. 243-tf.

☞ Mr. C. Shimer, of Gerry, Chau. Co., is authorized to act as Agent for the Rural New-Yorker, and for the Wool Dealer and Stock Register, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,
IS PUBLISHED EVERY SATURDAY,
BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

Subscription—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the Rural,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

☞ The postage on the Rural is but 3½ cents per quarter, payable in advance, in any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

Advertising.—Brief and appropriate advertisements will be inserted at $1.50 per square, (ten lines, or 100 words,) at 15 cents per line—*in advance*. The circulation of the Rural New-Yorker is several thousand greater than that of any other Agricultural or similar Journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

Progress and Improvement.

WANT AND USE OF CAPITAL IN FARMING.

THE want of Capital, and the neglect to make a judicious use of it when possessed, are among the heaviest drawbacks upon the prosperity of the agricultural community. In Farming, as in most other pursuits, Capital and Labor must be combined, and each wisely applied, to insure profitable results. Together they are the great levers of success, and, properly directed, unconquerable,—yet either, unaided by the other, is comparatively powerless. True, hundreds and perhaps thousands of our prosperous and well-to-do Western New York farmers commenced with little or no real cash capital—many of them possessing nothing but industry and energy, both necessary essentials to success—yet their progress has been continually impeded, at first by the lack of sufficient means, and latterly for want of a disposition to invest their surplus earnings, or a due proportion of the same, for the enrichment and improvement of their estates. Nature accomplishes wonders for the farmer, but even *her* face must be unwrinkled and caused to smile, —in other words, mother earth must be cleared, improved and well cultivated,—before the riches of her laboratory are produced in the greatest abundance and to the best advantage. And in order to accomplish this properly, and most profitably, money, mind and muscle are important and prominent desiderata. The mere *possession* of these valuable

[illegible] fer to use their spare capital, so far as it may be done advantageously, in permanent improvements upon their own premises,—from which they are certain of obtaining a return commensurate to the wisdom and extent of the application,—instead of investing it, with the expectation of early and large dividends, in distant and questionable enterprises. Many farmers in this region have missed more than one figure, and sunk, temporarily if not forever, no trifling amounts by making foreign instead of needed home investments. Not a few with whom we are personally acquainted, have money in bank, or in bonds and mortgages at 7 per cent interest, whose farms are actually deteriorating,—whereas the investment of a few hundred dollars, in each instance, would not only increase the value of the farm, but yield more than legal interest in the extra quality and quantity of the crops produced. This misdirection, or wrong application of capital, is one great cause of the unproductiveness of the soil and dilapidated appearance of the buildings, fences, &c., on many naturally rich and desirable farms—the owners not realizing that they possess the very safest and best banks for deposit and discount in the whole country.

Many of our readers, we apprehend, may properly be placed in a similar category with the class last named. With them the lack of capital is not so great a desideratum, as the want of a disposition to apply a due amount of what they already possess to the improvement and increased productiveness of their individual premises. And that those herein interested and addressed may see that we are not merely speculating and theorizing on the subject, we will suggestively mention for their consideration, and perchance figuring, a few items in the way of farm enrichment and improvement which would, in our opinion, give a handsome return for the investment of far more money and labor than are usually appropriated to such objects. In noticing different branches, we shall have little regard to the comparative prominence of either,—for each is more or less important, according to the location and circumstances of the farmer.

Prominent among the necessary requisites to good and profitable farming we should enumerate substantial and durable buildings, fences, implements, wagons, &c. The judicious expenditure of money and care in obtaining and preserving these, brings ample returns in both profit and pleasure—a proposition so evident to every intelligent reader that we need offer no argument in its support. The liberal investment of means to procure Domestic Animals of the most desirable improved breeds—thereby securing the best teams, cows, &c., as well as the most profitable breeding stock—always pays the skillful husbandman good dividends, and is worthy the attention and cyphering of hundreds who breed and keep the most common animals of the various kinds. The fact that an animal which will sell for $100 can be produced and kept as easily and almost as cheaply as one worth only half that amount, proves that it is worth while to make an expenditure to start properly in this branch of husbandry. A similar argument will apply to the production of good fruit, compared with the common and almost worthless sorts too generally grown—even in this fine fruit-growing region, and among farmers who profess to understand and achieve profitable cultivation. The sketch headed "The One-Acre Farm," published in our last number, though perhaps somewhat highly colored, conveys a truthful lesson on this point, and one which may be profitably heeded by the great majority of farmers throughout the country. The procuring of the purest seeds, of the best varieties, at even double the expense of foul and inferior kinds, is an investment of the first importance.

But in addition to the investments necessary to secure the best or most profitable buildings, fences, implements, animals, fruits, seeds, &c., there other expenditures of perhaps equal importance, from which large dividends may be obtained by increased crops, while the value of the farm itself will be considerably enhanced. Among these may be mentioned the expense of manures and fertilizers, under-drainage, deep tillage, the clearing and rendering productive waste land, (such as is now more or less covered with stumps, logs, stones, &c.,) and the expenditure of *more labor*, as well as money, upon the acres cultivated. Each of these points, or branches, will pay for more than ordinary attention and expense—yielding in ordinary seasons, and by proper management, better returns than the average of railroad, bank, or similar stock investments.

—This subject comprises other interesting features beside those to which we have alluded—including the advatages of investing capital in the purchase and improvement of both new and worn out lands,—but want of space forbids its further discussion at present. We may recur to it in a future number.

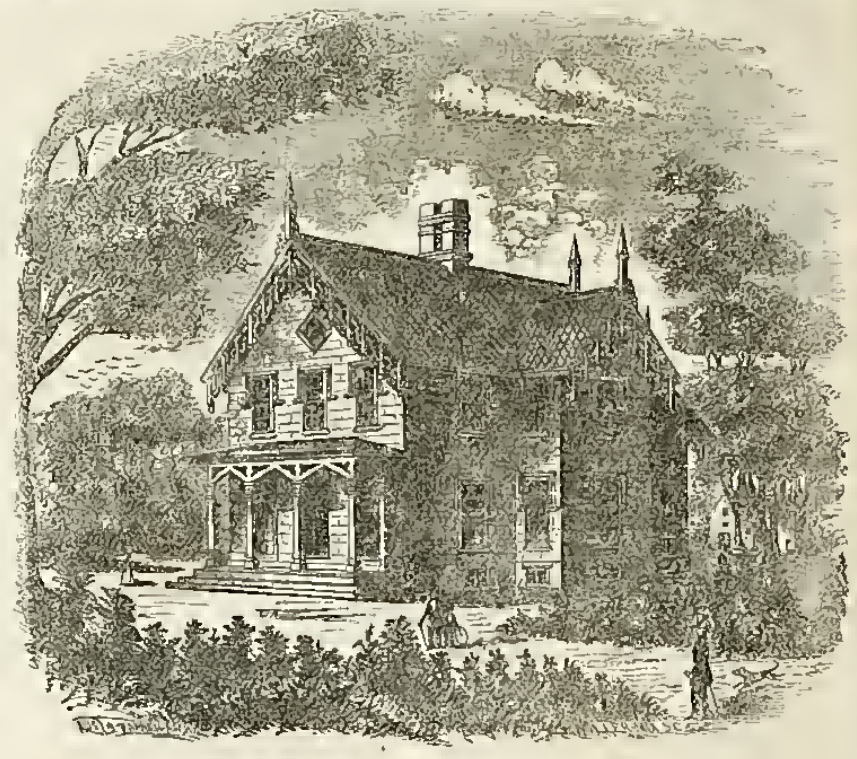
WINTERING MILCH COWS.

THE subject of wintering milch cows is one in which a large majority of our reader are interested, for probably most of people who own but a single domestic animal keep a cow, and those who are not thus limited generally include more or less of these faithful creatures among their stock. And the milch cow is worthy of this distinction. She produces one of the most wholesome and nutritious articles of food which we possess—one always in demand, and which there is no other means of supplying. Good cows always command a high price for they pay a good profit. But this profit depends largely on the attention they receive from their owners—whether they are so fed and cared for that they are thrifty, healthy, and yield largely of milk at all seasons of the year.

It is poor economy to winter cows upon dry food alone. They need something more succulent and nutritious. A full flow of milk requires a generous supply of the right kind of fodder. Carrots, beets, parsnips, or turnips in addition to hay and an occasional feed of meal or shorts,—a judicious use of hay, roots, and meal,—will keep the animals healthy and in good flow of milk even in winter. In England milch cows are fed principally on turnips and coarse fodder, and are stabled through the winter. They have a slight feed of straw or hay in the morning, and sliced turnips morning, noon, and evening, with an occasional supply of good straw to their mangers. Their stables are kept clean but well littered, and are also well ventilated, avoiding as far as may be, currents of air, from which cattle will take cold as well as human beings. The proper ventilation of stables, both for horses and cows is too often neglected.

But all have not and cannot procure the proper supply of roots. The drouth of the past season injured materially or entirely cut off the root crop in many parts of the country. In this case hay and the coarser grains must be used, and these properly prepared answer very well the desired purpose. Good, well-cured hay is far from being despised, even by the most aristocratic of the Fill Pail breed, though if first passed through a good cutting machine, it will be more readily and more economically consumed. Give cows what hay they will fully dispose of, and a peck or so per day of bran, shorts, or provender, wet to a proper consistence, and seasoned with a little salt, and they will continue in milk almost as long and give nearly as much as when supplied with roots. Oats and barley, or oats and corn, ground together, form a good mixture or provender for this purpose. If corn meal alone is used, it should be mixed with cut straw or hay, and slightly moistened—but a large quantity of this grain has a tendency to dry off the milk. It is better adapted to fattening than to milk-making purposes. Both potatoes and apples are excellent food for cows, but do not produce as rich milk as either beets or carrots. These roots are probably among the best foods which can be provided—to be used in connection with other kinds of fodder. No single food will succeed as well as a proper variety.

The thrift and health of all kinds of stock requires a supply of water, either frequently and stateilly, or always within their reach. It should be brought into the barn-yard, that cattle need not be compelled to wander off to a distant stream or pond through the storm and cold. Such a journey they will not undertake unless quite thirsty, when, were the water within their reach, they would drink much more frequently, but less at a time, not injuring themselves by abstinence at one time or an over supply at another. Their comfort in this respect as well as in shelter and cleanliness is the best economy, as an animal well-cared for and kept warm and clean, requires less food to keep it in thrifty condition. The best management is generally the cheapest in the end, and is always the most satisfactory to the thorough going farmer. We shall be glad if these hints call out from some such any improvement or modification of the course we have indicated, drawn from a wider experience than our own.

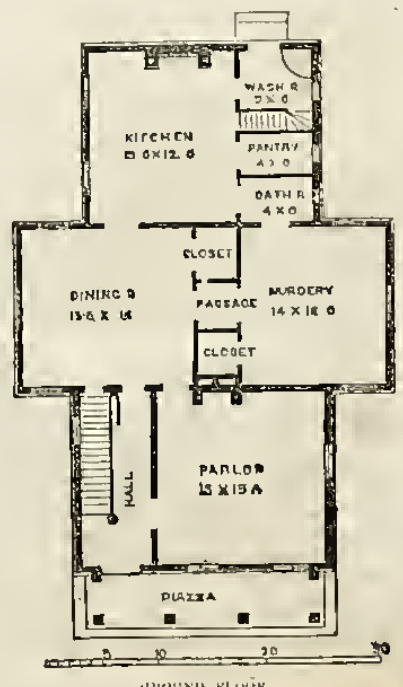


A SYMMETRICAL COTTAGE.—ELEVATION.

A SYMMETRICAL COTTAGE.

For a suburban residence, the accompanying plan will please many of our readers. It is symmetrical, not over ornamental, and its size and cost are such as to accommodate a large class of people. The number of those who can afford good houses increases every year, and they cannot expend money to better advantage than to build them. The design is by Messrs. AUSTIN & WARNER, of this city, and first appeared in the *Horticulturist* for November. It is there said to be "an illustration of a Cottage made ornamental at a very trifling expense, and without sacrificing truthfulness to that kind of tasteful simplicity which is the true touchstone of Cottage beauty." The plan is described as follows:

This Cottage is entered by means of an ample hall, off which is the parlor, 15 ft. by 15 feet 6 inches. The dining and living room is entered from either the hall or parlor, and is 15 ft. 6 in. by 14 ft., having closets, also a closet under stairs. Adjacent to the dining-room is the nursery, 14 ft. by 12 ft. 6 in., having a bathing-room and closet. Off of dining-room is the kitchen, 15 ft. 6 in. by 12 ft. 6 in., having an ample pantry, sink-room, &c. The back



GROUND FLOOR.

stairs ascend from the sink-room, which is a great convenience, as slops, &c., from the second story can be brought down these stairs without being seen from any of the principal rooms. Entrance to the cellar from the kitchen. In the hall is the principal stairs leading to second story, which is divided into bedrooms having closets attached; also inclosed stairs to attic, in which there are three large sleeping-rooms, with store-rooms, &c. The little front room in second story would make a bed-room if required, or a dressing-room attached to a large front bed-room.

SECOND FLOOR.

First story 9 ft. 6 in. high; second story 8 ft. high. The superstructure is framed, sheathed on the outside with 1¼ inch boards about 9 in. wide, put on horizontally, and rebated to imitate block work, and painted three good coats, the last two to be sanded; thus making the building appear like a stone one, with very little expense. To be plastered on the inside two coats (browning and white finish). The inside finish is to be plain and neat. Architraves in principal story to be 7 inches wide, bevelled hands; those in the second story, 6 in. The building finished complete, will cost about $2,000.

VENTILATION OF STABLES—We have sometimes speculated as to which stable is most inimical to the health and comfort of horses, the one with an inch between each plank in the floor, a hole in the door, a clapboard off one side and a broken window in the other with a leaky roof, or a small, tightly built one without any means of ventilation. Unfortunately there are too many of each class in all sections of the country. But the number is we trust, yearly getting less. See to it, however, you who have had energy enough to build a neat, good, substantial barn that from lack of judcious ventilation your horses are not as much injured in eyes and lungs from the lack of good air and the constant exhalation of noxious vapors, as they would be in other respects in the tumble-down barn of your neighbor SURETLESS.

EVERY farmer should have a corn sheller the size to be regulated by that of his crop.

Communications.

GENERAL APPEARANCE OF PRAIRIE.

Surface of Prairie in Iowa—Health on the Prairie—Prices of Land—Timber and Prairie—Emigration to this State—Disappointments.

THERE is perhaps n no more sublime sight in Nature, for a person who has never seen one of the mighty prairies of the West, than to stand on one of the high dividing ridges that overlook miles of the surrounding country, and for the first time in his life cast his eye over the almost boundless expanse spread out before him—not a tree, bush, stump or stone can be seen—not a living thing to arrest the sight—but the low waving grass as it moves to and fro in the cooling breeze, like the never ceasing waves of the ocean. He looks in vain for some object for the eye to rest upon—listens for some sound of life—but all is silent as the grave; the immense natural meadow which for centuries has been trod only by the Indian and wild buffalo, stands alone in its solitary grandeur. The thought arises, how is it that this rich, fertile, and well watered plain produces no timber, while a few miles farther in any direction, trees and bushes are growing in the greatest luxuriance; it cannot be a fault in the soil, for when planted with trees, they grow with the greatest rapidity, and if burned off by fires how is it that the dense forests of Michigan, Ohio and Indiana escaped? These are questions which are often asked. Who can answer?

In the spring, when the prairies are covered with green grass and flowers of every color, nothing can be more beautiful; but in autumn, when every living thing is withered by frost, and the howling winds and storms of sleet and rain sweep over them in wild chilling blasts, with not a tree or grove for miles to check their fury or shelter an unlucky traveller, nothing can be more fearfully dismal, and many are the stories of danger and death to the early settlers who have been overtaken by these merciless storms when the friendly cabins were far between.

Before describing the peculiar agricultural advantages and disadvantages of Iowa, I wish to correct a few false impressions, ideas and prejudices, which the great mass of people entertain who have never seen a prairie country. It is a very common opinion among Eastern people, that prairies are as level as a barn-floor, covered with grass growing about as high as a man's head. There are *some* such prairies in Illinois, but they are not common, generally being low, wet land, or river bottoms, which are liable to overflow, and are of little value excepting for grass. The general surface of Iowa is about as uneven as the land in Ontario and Monroe counties in your State, with this difference: the rises are more regular and gradual, so as hardly to be considered hills, the surface being more properly rolling or undulating than hilly. There are great dividing ridges running through the whole State, and the land descends from these in gradual undulations towards the large streams and rivers, intersected in all conceivable directions by sloughs, which widen out until near the stream, where they form what are called "river bottoms," which are either covered with tall, course, rank grass, or a heavy body of timber. The prairies are generally well watered with pure creeks coming from springs, and where these are not plenty, water of the best quality, cold and pure, can be found by digging.

An impression prevails in some parts, that prairies are unhealthy, and a more erroneous one never existed. River bottoms which are subject to overflow, and low wet grounds, which are full of pond holes containing stagnant water, about which vegetation is rank and left to decay, are unhealthy here as in all countries, but people of common sense will avoid these and settle on high, dry land, away from the malaria arising from stagnant water and decaying vegetation. As far as my observation extends, no country is more generally healthy than the rolling prairie of Iowa. The cool breeze sweeps over them throughout the whole warm season with almost as much regularity as the sea breezes fan the ocean. Chill fevers and ague sometimes attack new settlers, but they are as often brought on by imprudence and carelessness, as from any fault in the climate. If emigrants will come in the country in the fall, settle on high ground, use pure water and avoid exposure to night air, there is little danger of sickness.

People need not come here now with the expectation of finding timber and prairie at government prices any where near the Mississippi. All of the best timber in the State is now entered and held at pretty high prices, ranging from five to thirty dollars an acre, but none need stay away for lack of timber, for fire-wood, building and fencing material, can always be obtained with ten times less labor and cost than will clear up a farm in Michigan or Ohio. Plenty of good prairie can be had at $1,25 per acre, from fifty to one hundred miles back from the river. Improved farms near markets are worth from $10 to $30 per acre. Unimproved land, in the same localities, from $4 to $10 per acre.

These prices may seem high for land in this far, off country, but the immense rush of emigrants into this State for the past season fully warrants these prices, and they are still going upwards so fast that we hardly know what to ask for farms. I know many instances where land has doubled in value every year for the past three years, and there is hardly a farmer in the country but whose farm is worth *double* what he would have gladly sold it for *two years ago*. It is estimated that in the past season no less than 100,000 people have been added to the population of this State, and they are still coming faster than ever. A friend who came in on the Rock Island railroad told me it was needless to inquire of travelers where they were going to; "all are bound for Iowa."

No doubt many who come here will be disappointed in their expectations; some have no idea of the many inducements and peculiar advantages that are here presented to young men of energy, while others come with the expectation that the country is little short of a *paradise*, where the inhabitants are too ignorant and indolent to improve the great advantages their country possesses, and that it only needs a few leading spirits, men of education and talent, like *themselves*, to develop its resources and reap a rich reward of wealth and fame. Both classes are disappointed on arriving here, to find every thing so different from their expectations, and while one will paint every advantage in the most glowing colors and overlook all the disadvantages, the other cannot find a single inducement, and language is not sufficient to express his dislike and disappointment.

Most letters descriptive of the West, which find their way into the public journals are written by *travelers*, who judge of the country as it appears to them at the particular time they happen to see it, and who pick up their information second hand from land lords, stage drivers, and hotel loungers, and after they have properly *digested* and *averaged* these contradictory accounts, they *retail* them out to the public through some largely circulated journal as *reliable information*. Is it strange that so many are disappointed? Whatever I may send to you in future communications will be plain unvarnished facts; such as I have found of the advantages and disadvantages of *farming* and *living* in a prairie country after a three years' residence among the "Hawk Eyes." D. F. G.

Spring Rock, Iowa, Oct. 23, 1854.

WINTERING STOCK.

Much of the profit of rearing cattle depends upon the manner of keeping them thro' the winter. If they are suffered to lose flesh during the cold season, and turned out to pasture "spring poor," it takes a long time to regain what they have lost. With the best quality of early cut, and well made English hay, with regular and judicious feeding, and comfortable quarters, a stock of cattle, from the oldest to the youngest, may be made to thrive all winter, to gain size and flesh; with a small allowance of meal, potatoes, turnips, or other roots, they would do still better.

Our horses, cattle, and sheep, were originally constituted to subsist the year round, on green and succulent food.

By domestication, they have been gradually introduced from a warm, to the cold climate of the north, where, as with us, they generally have to be fed on dry forage for six months or more, every year. This, in some degree, is placing them in an unnatural condition, and it seems to us, it is a strong argument in favor of a more extensive root culture among us, for feeding purposes.

Most farmers have more or less course fodder, such as poor hay, corn fodder, straw, &c. And many commence feeding their cattle exclusively on these the first part of the winter, or till it is used up, and seem to think it is a "good riddance of bad rubbish." Cattle and sheep, doubtless, like a change of food as well as man, and when kept in good condition they seem to relish a fodder of meadow hay, corn-fodder, or straw occasionally; but if fed entirely on such fodder the first half of the winter, they lose flesh, and will be apt to come out in the spring in poor condition, in spite of English hay.

Corn-fodder is as nutritious as common stock hay, when fed in connection with it, but to compel cattle to live on such fare for weeks together, is, as some one has said, "absolutely cruel, as it makes their teeth sore when fed for a length of time." A better way is, to give cattle one fodder a day of corn butts, and that at the last feeding at night, and if they have a pretty stout allowance given them, they will eat it nearly clean before morning—at least, what they reject, will hardly pay for passing through the straw-cutter. Cattle, to do well, must have drink as well as food; and a free use of card and brush adds to their good looks.—*Granite Farmer.*

CURE FOR THE PIP.—Undoubtedly about these days some of your chickens will have this common chicken complaint. Cure it, simply by mixing a tablespoonful of sulphur with about three pounds of meal for a feed every other day, perhaps for a fortnight.

NEW USE FOR BEET ROOT.—Among the many uses to which beet root can be applied, is that of making pasteboard. A manufactory has just been established at Poulain in France.

Agricultural Miscellany.

THE next Biennial Meeting of the American Pomological Society will be held at Rochester, N. Y., Sept, 1856.

CONCORD has been fixed upon as the place for holding the next Provincial Fair of Upper Canada.

BUTTER.—In churning cream, add a lump of butter to the cream before commencing, and the butter will come in two-thirds the time it would without.—*Ex.*

Will some of our readers try this and report the result in the RURAL?

A GOOD CARROT CROP.—A correspondent of the *Country Gentleman*, C. SMITH, East Hamburgh, Erie Co., N. Y., cultivated a crop of carrots this year as follows:—About the 20th of May he gave it a generous dressing of hen manure and *plowed it in a foot deep.*—He then spread on a top dressing of the same fertilizer; after which it was reduced to a *perfect tilth* by the harrow and garden rake.—Carrot seed—the *orange*, which Mr. S. considers the best—was then drilled in, in rows from 10 to 12 inches apart, and the weeding afterwards faithfully attended to. *The product was thirteen hundred and seventy-five bushels per acre.* Mr. S. attributes this good crop to abundant manuring, deep tillage and "compactness of the rows, there being nearly two rows where cultivators usually make but one." The dry weather did not affect the crop in the least.

LIME IN THE SOIL.—If you want to ascertain whether a soil or substance *contains lime*, you may pour upon a small quantity of it, vinegar or diluted muriatic acid. If *lime is present* the mixture will froth up or effervesce.—*Dr. Kent.*

We little thought, when we extracted the above from Dr. KENT'S book *for the purpose of showing its error*, that it would be cut out of our article by some poor editor in search of fire lines to "fill out" with, and thus be thrown on the sea of newspaper literature without one word of dissent. We hazard nothing in saying that in this form it will find its way into the columns of 500 papers in less than a year. So true it is that "a lie will travel from Maine to Georgia while truth is putting on its boots."

HINTS FOR FARMERS.

SAND YOUR STALLS.—Let fresh clean sand be sprinkled every day over the floors of your tie-ups. This will keep the animals clean, and prevent their being attacked by vermin. Every morning, remove all the excrement to the manure shed, and throw over it a few handfuls of gypsum or pulverized charcoal.

CHARCOAL FOR HOGS.—Provide a trough, or other suitable receptacle, fill it with charcoal, and place it in your hog-pen. Few articles that can be administered to swine, will prove more beneficial than this.

SALT FOR HORSES.—Deposit a lump of rock salt in your horse's manger, and allow him to have free access to it.

FENCE POSTS.—Char your fence posts to a coal before setting, and set them top down.—You will find these to be excellent preventive against rot. Posts, thus treated, will last much longer than if set in the ordinary way.

GATES are much handier, and far more economical in the long run, than bars. At every entrance, set a good stone post firmly in the soil, and append thereto a light but strong gate. With the proper materials and tools, almost any person can construct a good and efficient gate, and hang it. It should also be protected from the weather by a coat of paint.

STONE STEPS will be found much more economical than wooden ones. Place a set at every door, where you are not particularly anxious about the "ornamental." They may cost you a trifle more at first, but they will be the cheapest in the end. Let a good scraper be firmly inserted at one end.

SINK WASH.—Arrange so that all the water from the sink and wash-room may be conveyed to the compost heap; also the urine made on the premises, and the rich liquid from the privy. From twenty to twenty-five loads of excellent manure may be made in this way, annually.—*Germantown Telegraph.*

DEPTH AND MELLOWNESS OF SOIL.—Depth and mellowness of soil may be considered the principal characteristics of successful gardening. In our school-boy days, we have all read of the dying Husbandman, who told his son never to part with the vineyard, as there was a valuable treasure lying within a few inches of the surface. The young man, in the expectation of finding a bag of money, carefully turned over the soil, but found nothing. In the subsequent harvest, however, he was astonished at the extraordinary luxuriance of his crops, and then understood for the first time the enigmatical meaning of his father's words.—*Boston Cultivator.*

No barn can be kept warm where the underpinning is loose, and the wind sweeps under the floors. Roofs should be made tight, and the barn close, where the animals stand.

THE Connecticut papers say that potatoes are the best crop in that State this year, yielding three times the usual amount.

COUCH, QUACK, WITCH OR "PHIN" GRASS.

THE *Transactions of the New Hampshire State Agricultural Society* for 1853, contains an interesting report on Grasses. After speaking of Redtop *(Poa Pratensis)* as an invaluable pasture grass, continuing longer in the soil than most other grass; and Herds Grass or Timothy *(Phleum Pratense)* as holding the first rank as a hay making grass; and of Red Clover *(Trifolium Pratense)* "as a coarse, sweet grass, readily raised but not easily cured, and if not properly cured it is little better than "mulch and litter" for the stable and yard;" it favors us with the following dissertation on Couch, Quack or Witch grass. Those of our readers who have had as much trouble as the writer in eradicating from their farms what one of our correspondents calls Mons. QUACKERY, will not be over anxious to procure Quack seed to stock their meadows with—However we give the article and let it speak for itself. We observe that, a little further on, the *sweet scented Vernal grass (anthoxanthum odoratum)* is extravagantly lauded, and, it is said, "the person who shall introduce it into our State will confer a lasting favor on our community." Further "there can be no doubt that the peculiar excellence of the Philadelphia butter is owing to the presence of this grass in the pastures of that region," &c.—There are those, however, who *do doubt* it; and those even who think the grass very inferior to redtop and timothy. But we will not discuss that point. Read what is said of Couch Grass:

In addition to these grasses, (Redtop, Herds and Clover,) there are others that are gradually coming into cultivation for pasture and hay making purposes, that need only to be better known to be generally cultivated. In the first rank of these we place Couch grass, *(Triticum repens,)* a grass that is beginning to be appreciated upon the Merrimack, but which has usually been condemned as a curse upon a farm. It is often called Witch grass, and in the upper Merrimack Valley is known as "Fins grass" or Fingrass, from "Phinens Virgin," we believe, upon whose land, in Concord, it was first cultivated. Its proper name, however, is Couch grass. It is a stocky, hearty, clean, sweet grass, and if properly cut and cured, *will command a higher price in the market where it is known, than Herd's grass.* In addition to this it has other peculiar qualities. It will propagate from the root as well as the seed, will accommodate itself to poor as well as rich land, dry as well as moist land, growing most luxuriantly upon meadows and in valleys, and still not refusing a fair growth upon a pine plain, a gravel bank, or a sand knowl. Such a grass is invaluable. But it has its drawback. Once in the soil it is there for a lifetime. It cares little for plow, harrow or hoe. Cutting it only multiplies it. For this reason it is considered a curse in a field for tillage. It is a grass that will not be kept under by cultivation. For this very reason it is invaluable. It will grow upon light soils, and produce well. But the true secret is to sow it upon our lands and cultivate it by *top dressing.* Once sown, apply top dressing, and the soil need not be touched with plow or hoe for a quarter of a century. If the crop fails in spots, upon knowls and other places, apply a heavy harrow, an extra sprinkling of manure, a liberal quantity of Couch seed, harrow again and roll, and the work is done. A field kept in Couch grass in this way will produce a greater profit in hay than if kept in any other grass in the usual method.

It may appear singular that we should recommend the cultivation of a grass that botanists pronounce a "noxious weed in garden or fields," but experience shows that the botanists know little of its value. Fifty years since upon the intervales of the Merrimack this grass was considered as a curse by the farmers generally; but within the last twenty-five years it has become to be considered of equal if not of greater value than Herd's grass. The more its qualities are considered, and its adaptation to soils, and appropriate cultivation are studied, the more reliable it will become.

CLEAN OUT YOUR STABLES DAILY.

A correspondent of the *Germantown Telegraph* purchased at a high price a young horse which he knew to be perfectly sound. In six months he became quite lame, so lame that it became painful to drive him, and he was sold. He then bought another one, young, strong and quite sound. He, too, in less than six months was lame in his feet, and so lame that his owner was forced to desist from using him. The cause and cure of the evil we give in his own words:

I now began to reflect seriously on the matter, and to hunt for the cause. Both these horses had stood on the same soft floor. It was my practice to allow the manure to accumulate under the animal to the depth of twenty inches, fresh straw being sprinkled under him daily to keep him clean—and then clear it out. This manure, from its fermentable nature, acted like a *hot-bed*, sending forth great heat, at times, and copious exhalations of *ammonia.*—But on this, the animal was compelled to stand; there was no escape. A thought suggested itself. The manure was removed, the horse's feet and legs carefully washed in cold water three or four times a day, and he compelled to stand on the hard plank floor instead of on the manure. *He was cured!* I have not, since this change in my practice, had a lame horse. If others who have horses with tender feet, have managed as I did, they will do well to change their practice at once.

SOOT contains 50 per cent of potash.

Inquiries and Answers.

WATER LIME.—Please inform me, through the RURAL, where hydraulic or water lime can be obtained, and what is the price per barrel?—A. MCNAMY, *Deersville, Harrison Co., Ohio.*

ASHES AND LIME FOR WHEAT.—I would like to have you, or some of your subscribers, inform me through the RURAL, whether lime or ashes sown on wheat are beneficial, and which is the best of the two; and also, the quantity per acre; and the best season of the year for sowing them?—A SUBSCRIBER, *Lysander, Co., N. Y.*

FEEDING DOWN WINTER WHEAT.—As this fall has been an unusual one for the rapid and heavy growth of winter sown grain, will some of your "practical farmer" correspondents, that are "posted up," give their experience as to the practicability of "feeding down" winter wheat. Since the winters in this latitude are very open, why should a heavy growth smother the root, as is generally supposed, where it is necessary for the good of the plant that there be a proper depth of snow to prevent its "freezing out?"—In this section last winter were many fields of wheat almost entirely destroyed that looked fine the fall previous. The wheat was sown with a drill, on well-prepared, gravelly loam soil, with a loose subsoil. Some of it was fed down; was that the cause of its winter killing, or what was it?—WM. D. RICE, *Elbridge, Onondaga Co., N. Y.*

DOOR YARD FENCES.—In answer to B. G. S., in RURAL of Nov. 11th, we have received the following:

The cheapest neat and durable "door-yard fence" I have ever seen is Burns' patent round picket fence. Its cost is from five to eight dollars, complete, per rod. The best posts are of red cedar. Whatever timber is used, should be charred at the end inserted in the ground three and a half to four and a half feet, and buried—the top end of the tree down—the small posts three feet, and the gate and corner posts four feet deep. In clayey soil, a short cross, framed and firmly pinned on the lower end before charring, will effectually prevent their heaving by the frost. E. S. H.

PLASTER OF PARIS AND GREEN MANURE.

In conversation not long since with Mr. Benjamin Chandler, an industrious and observing farmer in Starks, Somerset County, he observed that he had, by experiment, ascertained how he could use green or unfermented manure in the hills of corn. Formerly, whenever he put unfermented manure in the hills of corn, the corn would, instead of growing thriftily, as is the case when well rotted manure is used in this way, become yellow in color, and seems to be injured rather that benefitted by it.—This he attributed to too great a supply of ammonia, or other substance liberated when the manure began to ferment.

Having read that Plaster of Paris would absorb and change the action or nature of ammonia, he tried it in this way.

After placing a shovel full of green manure in the hill, he covered it over with soil, and on this threw a large spoonful or more of Plaster of Paris, then dropped his corn and covered it. When thus planted, the corn invariably grew rank, and filled the ears as well as if the manure had been thoroughly composted and decomposed.

One spring, when planting his corn in this way, he had not plaster enough to go over the whole field, and accordingly, was under the necessity of planting a portion of it with green manure in the holes and no plaster over it.

The result was an excellent crop as far as the plaster was used, while in the remainder of the field, the corn was yellow and sickly during the whole season, and yielded comparatively little. These are important facts in the corn culture.—*Maine Farmer.*

TO KILL LICE ON CATTLE.—H. Mudgett, in the Prairie Farmer, says that a small quantity of dry slacked lime rubbed into the hair of cattle, will destroy all lice. If a remedy, it is a cheap and easy one.

THE Chinese Yam has been introduced in Paris, from China, which the chemists and experimentists say possesses all the requirements of the potato, and may take the place of that plant as a culinary vegetable.

THE Boston Courier says that during the week ending on Friday last, there arrived in that city, by railroads alone, three hundred and fifty-six tons of butter.

Orchard and Garden.

PARKS AND PLEASURE GROUNDS.

The leading article of the *Horticulturist* for November, touches a question of much interest to all classes, and especially to all intelligent agriculturists. The present is a time of progress and improvement unparalleled in former years. Better implements, improved stock, thorough cultivation, comfortable and tasty houses, good orchards and gardens, are everywhere seen; the farming interest is evidently increasing in wealth and importance. This is as it should be, for it is at the foundation of all true prosperity.

Attractive as this picture may be, it might have additional charms. The useful and the profitable should not only be considered, but thought should be given to the beautiful and the intellectual. And the question which our contemporary takes up is "How shall the farmer's home and the farmer's life be made more attractive?" How shall we fix the love of home and the feeling which clings to "the old farm" more deeply in the hearts of our agricultural population? It then gives the following suggestions on parks and pleasure grounds:

Make home attractive;—cultivate the taste, and feelings, and affections, as well as you do your fields. Why should a wealthy farmer with his 50, 100, or 200 or 300 acres of land, content himself with a rod or two of door-yard, and a dozen of shade trees, shaped and fashioned after the precise fashion of a village plot? Why can he not, just as well, have a park and pleasure ground of several acres around his house, broad glades of lawn, and groups of trees, separated from the cultivated portions of the farm by green hedges? This, with a well stocked orchard and good ample kitchen garden, would come up to our ideas of a country home; and it would be impossible for children to grow up in such a home without becoming attached to it, and having their tastes expanded, their feelings refined, or without appreciating the comforts and blessings of a country life. A roll or two of a door-yard for a farm house!—what a mockery! There is something incongruous in the very look of it that cannot fail to strike every observing person; it wants what the lamented Downing called *"local truth"* in architecture.

But some careful farmer will ask us, "How can we afford to lay out parks and pleasure-grounds, and keep them in fine condition? It would cost as much than the whole labor of our farms. Only think of what an expenditure of money and labor this hedging, and planting, and mowing this pleasure-ground would involve. It would all be very well if we could afford it; but that we can not, and we must leave it to retired gentlemen who have made their fortunes in town, and come out into the country to spend them."

But we reply, You can carry out our plan without incurring a heavy expense. Hundreds of farmers in our own county of Monroe can make such a park as we propose, without feeling the cost. Fence off, with Osage, Orange or Buckthorn, at a cost of about twenty to twenty-five cents a rod, five to ten acres of land immediately around your dwelling. Seed it down, and it will produce good crops of hay. You can get plenty of young Maples, Elms, Tulip-trees, Bassroods, Ash, and other native trees, in the woods, which can be taken up and planted at leisure intervals in the fall, when farm labor is over, and early in spring, before it commences, and even during winter, in mild weather. Until the trees are well established, it will be necessary to cultivate the soil around them. It will not be necessary to cover the whole ground with trees, but merely to scatter them here and there in groups, and singly, to give it a park-like character which will distinguish it at once from the cultivated fields. A little can be done now, and a little again, as leisure affords; and in a few years the work will show. Meantime the land is cropped profitably; for hay is always a paying crop and an indispensable one. The ground nearest the house may be planted with some rarer trees—a portion of them evergreens. A small portion of the ground near the house might be separated from the main body of the park by a wire fence, or movable hurdle fence, and kept mowed; and if embellished with a few flowering shrubs, and a few beds of flowers, all the better. But these, for economy's sake, can very well be dispensed with. When the planting is finished, and the trees fairly established, the park might be pastured with sheep, as many parks are in Europe; and thus it would always have a closely cut surface without the expense of mowing, and the sheep would be an interesting feature in its scenery. When forest trees are not within reach, we would recommend the raising of them from seed, or small plants can be purchased at the nurseries for $2 or $3 per 100, which, with a couple of years' growth in nursery rows, will be fit for final planting out. Only go about it, and the means will not be wanting.

PRESERVING CABBAGES IN WINTER.—I have a method of preserving cabbages through the winter, which I consider very simple and at the same time very good.

I select a dry spot in my garden, and pile my cabages upon it, turning the roots inwards and placing them as compactly as possible—not more than 20 or 26 heads should be put in one heap,—then cover 5 or 6 inches thick with dirt alone. The loose, outside leaves should be taken off. Loose heads, and those not fully grown, will come out fine in the spring—as fine as by any other process. I have practiced this method for the past 13 years without a single failure. R. B. W.

MATHEWS' CURCULIO REMEDY.

In the September number of the *Horticulturist*, you make the inquiry, in regard to Mr. Mathews' Curculio Remedy. I made an application to quite a number of trees, and in every instance I was very successful. The trees had overloaded crops, and all who have seen the trees were surprised. Another advantage which they possessed over the trees in this vicinity, where the shaking and killing process was resorted to, is, that not a single plum rotted on any of the trees where Mr. Mathews' remedy was applied, while the complaint was universal from those persons who had practiced the shaking process. Mr. Mathews' remedy has but one application, while the shaking process lasted four to six weeks. On a tree of *Prince's Imperial Gage*, owned by one of the citizens of Syracuse, on which the curculio had stung nearly all the crop at an early day in the season, the owner was confident to find about forty plums which were yet perfect, or free from injury. He came to me, and said if I could save those plums,—that is, the forty,—he would believe in the remedy. I made the application once only, and all the plums punctured fell off, while those missing at the time, remained sound and ripened into perfect fruit. I had the pleasure of showing Mr. Charles Downing and Dr. Grant the identical tree, with its ripe plums on, of which they ate some.

As regards the Committees appointed, they have all concluded to test it another season before they report. With some, the success has been unprecedented; in some cases, and not so good in others; which partial failure Mr. Mathews attributes to an imperfect application of the remedy.

For the benefit of the public, I will state that one of the committee appointed by the New York State Agricultural Society, wrote me that he had a few trees in his yard, or lot. To one he applied Mr. Mathews' remedy, and the others the shaking and killing process. (I write now from recollection, not having his letter before me.) The one to which Mr. Mathews' remedy was applied (only once) had an enormous crop of fruit; once or twice he shook off or picked off half of the fruit, and then the tree was too full, and it was evenly distributed over the whole tree. With the other system, he had to continue from day to day, for weeks, shaking, catching, and killing, and the result was a moderate crop only. Thus the superiority of Mr. Mathews's remedy—a large crop and one application.

In another experiment by the same person in another lot, he was not as successful as in his home lot, but expresses himself decidedly that it is the best remedy ever offered, so far. In order that they may give it another trial, and be particular in each application, the committees have agreed to test it again next season, and then report fully.

Mr. Mathews, in a late letter to me, says he will wager $100 on any tree, in any soil, and anywhere, that he will save a full crop by one application of his remedy. I have, from my experiments, the fullest confidence in it.—A. VANNESTOCK, *Syracuse, N. Y.* in *Horticult.*

SWEET APPLES.

Whoever will introduce a new richly flavored, sweet winter apple of good size, or supply the market with any good varieties not grown, will find a fair profit, and supply the place of unnumbered excellent home-grown with the means of preparing a most delicious dessert.—*N. E. Farmer.*

We like the above suggestions: If any man does not like a good sweet apple well baked, his taste and ours is very different. Why then, asks one, are sweet apples such a drug in the market? They are not. There may be times when early sweet apples are plenty. We have several varieties of these and their day is a very short one. But about four weeks are allowed for gathering, marketing and consuming nearly one half of the good varieties of sweet apples the market affords; and this is just the time when other fruits are in the greatest abundance and perfection. Throw into the market to-day an apple as good as the early Golden Sweet, and let the price be such as to bring it within the reach of the frugal and industrious portion of the community, and it would command a ready market, to an extent far above the ability of the country to supply. But the wants of the community are to a great extent artificial. A vast many articles in every department of living, have now become, in our view indispensable, which a few years since were unknown. We see an article, we try it, we like, continue to use, and feel that we cannot live comfortably without it. Such will, we are confident, be the case with sweet apples of good size and flavor. Let them be produced in quantities that will enable the cultivator to use economy in the production and sale, and a fair profit may be secured to him, while the price shall still enable the consumer to use freely, without the idea of a high priced luxury. Now a bushel of prime apples costs true thrifts of a bushel of wheat, and more in our market than wheat in a western one.

We may learn a lesson from the use of apples now. They cost too much to eat, yet custom has made it requisite in all families to have pies made of apples. These are called a necessary article, and most families will use more or less apples in this way, let the price be what it may. This custom arose when apples which would answer for pies were plenty and cheap, and it continues when they are scare and dear. So let good sweet apples, not those tough as white oak, astringent as a gall nut, bitter as a pig walnut, or dry as a piece of cork, be furnished freely, and they will soon become an essential article of good living, and a steady demand, conducive to the profit of the producers, and to the happiness and advantage of the consumer, will be created.

THERE is no vegetable more wasting to the fertility of the soil than tansy, while it adds the least of any to its fertility by being turned to manure after having been used.

THOROUGH DRAINAGE FOR GRAPE VINES.

We have, in our garden, two Isabella vines, both well covered with fruit. The older and larger vine, which ought to give the finer fruit, has many of its bunches badly mildewed, though its exposure is on the south side of the house. The younger vine has scarcely a mildewed grape upon it, and the bunches are very uniformly ripened, though it stands upon the southern side of a board fence, and has little sun after ten o'clock A. M. The latter has a very perfect drainage, the bottom of the border being laid with ox scalls. The former has no such provision to carry off the surplus water, though it is abundantly furnished with bones. We attribute the whole difference to drainage.

In preparing vine borders, make provision for thorough drainage, and make the border deep, broad, and rich. If we were to prepare a border as thoroughly for a vineyard, we think we should have Isabellas and Catawbas of much larger growth, and finer quality. If we could in this way get bunches of two or three pounds' weight, instead of half a pound, it would pay for the extra expense. Thorough drainage, we are convinced by our experiment, is a great safeguard against the mildew, and hastens the maturity of the fruit.

Now is a good time to prepare the borders, though we have found Spring much the best time for setting the vines. A southern exposure with a little slope, is the best location for a border, but a trench four feet wide, at least, and four deep; and at the lower end, see that there is some provision made for the water to pass off. Put a layer of course cobble-stones at the bottom, say six inches thick—then a layer of bones, and then your compost, and surface earth. This will give you grapes worth eating.—*Amer. Agr.*

STRAWBERRY RUNNERS.

These should be contemplated in the light of weeds, and destroyed. They are no less detrimental to the plants than ordinary kinds of spurious vegetation, and produce effects equally as deleterious upon the crop. A writer in the *Gardener's Chronicle* remarks, "So convinced am I of the propriety of cultivating this fruit in separate and distinct plants, and of cutting off the runners, that I have this season taken out a plant between each of my plantations—thus making the distance between each plant *four feet by three.*" This is, perhaps, running somewhat too far into the opposite extreme, but there can be no question that an open arrangement is preferable to a close and crowded one.

A writer in one of the agricultural journals in course of observations on Strawberry Culture, after asserting his opinion that most persons allow their vines "*to run themselves to death,*" says:—"If you would observe the plants that grow the best in the fields, you will see that they are those which have but few or no runners; while those which have run very much, and become matted, bear little or no fruit. This is a lesson worth observing, when you come to cultivate the strawberry in the garden. Where the wild plant has not sent much runner, from some cause or other, you will find the stock large and strong, the leaves broad and healthy, and the fruit, which has the benefit of both sun and air, is large and high flavored. If you have strawberry plants in your garden, keep the runners down to a foot in length, and you will make them healthier and more fruitful."—*N. E. Farmer.*

Domestic Economy.

APPLE MOLASSES.—We, for one, confess to a love of good, properly prepared apple molasses. For this purpose the *sweetest* apples should be selected. The cider must be taken fresh from the press before fermentation commences, and slowly boiled down in a copper kettle. From four to five gallons of cider will make one of molasses. Great caution is necessary towards the termination of the process to avoid burning. The cider should be boiled down till when cold it is as thick as West India molasses. If the apples are not sweet a little sugar or molasses may be added *during the boiling down.* In fact, we prefer to do so in all cases, the peculiar flavor of the apple molasses improves the West India molasses, and the latter, to our mind, improves the former and improves its keeping qualities. The practice however is not common. The various uses of apple molasses will present themselves to the mind of every lover of mince, apple, or tart pies, summer beer, and other luxuries.

TO BOIL EGGS.—Put a pint of water into a small pan; when boiling, put two eggs in, and boil according to size—from two and a half to four minutes. Fresh-laid eggs will not take so long, and if only just set, are excellent for clearing the voice.

To boil them for toast, they require six minutes; take them out, throw them in cold water, remove the shell, and cut them into slices; put them on the buttered toast, a little pepper and salt, and serve. These are excellent with a little catsup put on the eggs, then with bread crumbed, and mummidered over, and serve.

BLACKING BALLS.—One pound ivory black, one pound bruised black, one quarter pound gum arabic dissolved in water, six ounces brown sugar, half an ounce of melted glue, one quart of water, and make all into balls.

TO WHITEN THE TEETH.—Mix honey with finely powdered charcoal, and use the paste as a dentrifice.

TO SEW NEW AND STIFF CLOTH EASILY.—Pass a cake of white soap a few times over it, and the needle will penetrate easily.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office, For the week ending Oct. 31, 1854.

Nathan Atherton, of Philadelphia, improvement in steam engines.

Abraham Beesford, New York, improved key for tuning piano fortes.

A. A. and G. H. Babcock, Westerly, improved press for printing in colors.

Charles Balder, New York, for knife dye for cutting leather straps for whips.

Joseph Barker, Honesdale, Pa., improvement in grain winnowers.

Ephraim Brown, Lowell, for improved burglar' alarm.

Wilburn Clemson, Boston, improvement in apparatus for tempering and flattening saws.

Harry H. Evatts, Chicago, assignor to himself and A. J. Brown, of same place, for shingle machine.

Junius Foster, Green Point, for improved burglars' alarm.

Wm. Gates, Jr., Frankford, N. Y., machine for filling match frames.

Robert Hunnage, Lowell, improvement in india clothing for picker cylinder.

John C. Howe, of Milwaukee, improvement in fire arms.

John Harris, Lansingburg, and John B. Stull and Galen Richmond, of Troy, improvement in machinery for making rope and cordage.

Chesley Jarnagin, Clinton, Tenn., improved seats for wagons.

Richard Kitson, Lowell, improvement in machinery for picking cotton and other fibrous substances.

John M. Krider, of Newton, Stephensburgh, Va., improvement in tailors' measuring instruments.

Samuel Lenher, Philadelphia, for attachment to siphon.

Warren and Charles F. Lillibridge, Zanesville, improved tailor's measure.

James E. McConnell, Wolverton, England, improvement in Railroad car axles.

Daniel Moore, Williamsburgh, improvement in cartridges for breech loading fire-arms.

Daniel Moore, Williamsburgh, for improved powder flask for breech loading guns.

Vincent Palen, Portsmouth, Va., for improved arrangement in mechanism for sawing off piles under water.

John Richardson, New York, improved pen and pencil case.

Ellhanan W. Scott, Lowell, for machine for manufacturing rivet-heads.

William J. Stevenson, New York, improved soldering furnace.

Samuel R. Thorp, Batavia, improvement in ordnometers.

Julius Thompson, Middleburg, N. Y., improvement in odometers.

Samuel Vansyckel, Little York, N. J., for improvement in grain bars.

R. A. Wilder, Schuylkill Haven, improved arrangement in spark arresters for heating feed water.

S. R. Wilmot, New Haven, for water meter.

Alonzo S. Woodward, Lowell, and Benj. F. Bartlett, Pepperell, Mass., for improvement in machinery for cutting rags for making paper.

William Sewall, Brooklyn, improvement in surface condensers. Patented in England, Jan. 13, 1854.

RE-ISSUE.

Jeremiah Atkins, Chicago, for improvement in rakes to grain harvesters. Patented December 21, 1852.

DESIGNS.

Isaac DeZouche, Troy, for design for brackets.

Nathaniel S. Price, Boston, Mass., assignor to Franklin, Mozzy & Co., Bangor, and Allen Lombard, Augusta, Me., for design for Franklin fire places.

ADDITIONAL IMPROVEMENTS.

Martin Newman, 2d, and N. C. Whitecomb, Lansboro', Pa., and G. C. Cole, Hartford, Ct., for improvement in whiffle tree hooks. Letters patent dated Feb. 21, 1854.

Wm. Thornley, of Philadelphia, for improved safety-washer for securing wheels to axles. Letters patent dated Sept. 19, 1854.

INDUSTRIAL EXHIBITION AT PARIS.

THE Palais de l'Industrie is nearly finished, and it will be ready to receive the goods at the specified time, viz., 15th January to the 15th of March, 1855.

It seems that every Frenchman takes interest and pride in this national affair. The City Government of Paris makes great efforts to give to Paris a bright appearance for the occasion. All houses are scraped, painted and ornamented; the Rue de Rivoli will be finished, the Tuileries are in progress, and will be free from the scaffolding about that time; the great new American hotel is just springing from the ground; all and everybody are busy for the universal exhibition.

The Palais de l'Industrie is really a splendid edifice. It is only half the size of the London Crystal Palace, yet it is roomy, and very advantageously constructed for the object. It is a combination of stone, iron and glass, blended in the most happy manner, of graceful appearance, yet strong, and built for centuries. A lofty triumphal arch forms the principal entrance, a monument in itself. The entablature is supported by heavy ornamental Corinthian columns. A colossal group of allegorical figures, representing France protecting the Arts and Industry, by M. Robert, surmounts the archway. The frieze is enriched by a beautiful bas-relief by M. Deboeux, representing Agriculture, Industry and the Arts. The bas-reliefs over the arch are designed and executed by Messrs. Villaire and Diebolt, and rival with the rest of the sculpture in beauty and vigor of design.

The interior, as well as the exterior, is exceedingly imposing, and we have had opportunity to hear repeatedly from persons who saw the London Crystal Palace, that the Palace de l'Industrie surpasses the former in every respect except size. The Government is just building another large building for the paintings and statuary, and for the heavy machinery requiring steam and water-power. This structure and the main building give, together, as much room as there was in the Crystal Palace.

Every American who sees this extensive and splendid preparation for the second World's Fair, cannot otherwise than desire that the United States should be well represented, especially as the French Government, aside from its liberality in regard to the free admission and transportation of the articles from and to the seaport towns of France, has allotted a large space for the United States, in a very conspicuous situation, worthy a great nation. We know that the United States cannot yet excel in articles of luxury, but here are innumerable articles of utility, of incredible excellence and cheapness, which will furnish the best proofs of the rapid progress of American industry, and establish our superiority in many respects over that of other countries. We are sure that all kinds of agricultural implements will surpass the English as well as those from other countries, and they will sell well—

The same will be the case with raw ginned cotton roller gins, very important articles for Algeria, Egypt, &c.

PADDLE-BOX LIFE-BOAT.

THE late terrible disaster upon the Atlantic appears to have given a new impulse to the spirit of invention, and there is a strong probability that improvements will be made or measures devised whereby travelling on our great steamers will be rendered far more safe than it has hitherto been. Among the many recent projects for affording greater security to the travelling public is an invention, by Mr. Thomas Hodgson, of Brooklyn. As we understand it, the upper portion of the paddle boxes is to be so constructed that it can be removed in case of necessity and converted into permanent life-boats, to be so arranged that they may be supplied with water, provisions, &c., and rendered comparatively comfortable. They are so planned that they may be unshipped at pleasure and in a very few minutes transformed into a kind of vessel or float that cannot be sunk, though entirely filled with water. Preliminary measures have been taken to secure a patent for the discovery, both in this country and England. A model is in possession of Messrs. Munn & Co., and any information in regard to the invention may be obtained of Thomas A. Wilkinson, No. 26 Beach-place, Brooklyn.

THE NEW AUSTRIAN GUN.—The new gun, of which Austrian military men are so proud, only differs from the common musket in the fact that six very superficial grooves are cut down the inner surface of the barrel. The surface of the lower part of the bullet, which is very soft lead, is deeply notched, and the action of the ramrod naturally forces the projecting edges of the bullet into the grooves.—The barrels are furnished at the breech with what is technically called a "thorn." The thorn, or *tige*, is a round solid piece of iron, projecting nearly an inch and a half into the inner and lower part of the barrel. Round the thorn, that is, between the thorn and the inner surface of the barrel, there is naturally an empty space, and into this the charge of powder falls. When the indented or crimped bullet is rammed down, it completely fills the lower part of the grooves, but can descend no further than the point or top of the thorn; and the consequence is, that the powder, being subjected to no pressure, every grain of it ignites at one and the same time, and propels the ball with prodigious force."

CAST AND WROUGHT IRON WATER PIPES.—A correspondent inquires of us, if we can furnish him with data for calculating the length of time wrought iron water pipes will endure in a sand and clay soil. We cannot, because the time required to thoroughly rust wrought iron depends on certain conditions.—Wrought iron rusts with extraordinary rapidity when exposed to a moist atmosphere, and especially a sea air. It also oxydizes very rapidly when buried in a porous moist soil, and especially what is called *sour water*, such as water containing vegetable sap, like that of decayed leaves, &c. But wrought iron pipes covered with a thin coating of red lead, thoroughly dried, and another on the top of this of coal tar, then laid underground in a bed of cement, will endure for a century. Cast iron pipes, however, are generally employed for conveying water underground, and we think they are preferable, being cheaper, and not subject to rust.—*Scientific American.*

EXPERIMENTS OF PROF. AIRY IN A COAL PIT.—One of the most interesting astronomical experiments that has been for many years attempted in Europe, is just being performed by the Astronomer Royal at Greenwich, in a coal pit near South Shields, 1260 feet (or nearly a quarter of a mile) deep, in which a room has been fitted, provided with a pendulum and a series of delicate instruments constructed for the purpose. Above, on the surface, exactly vertical to the room below, is another room, its exact counterpart. In those rooms delicate pendulum observations are being made day and night to test the density of the earth by the number of oscillations in 24 hours, where, compared with the number below.—*London Paper.*

AN INGENIOUSLY MADE CLOCK.—An artist in Philadelphia has invented a clock that runs a whole year without winding but once. The place of the pendulum wire is occupied by a straight watch spring, to which is attached a horizontal brass plate of the size of a twenty-five cent piece. In the circumference of this plate are inserted six small round bars, from the outer end of which depend six heavy leaden balls. The whole arrangement turns on its own axis, the minute hand moving with it for one minute, when it stops and turns in the opposite direction the succeeding three minutes. Each minute requires three revolutions.

By the ingenuity of Abel Russell, of Brooklyn, N. Y., it is said a complete rocking-chair is so formed that when not required for use it may be folded up and packed away in a trunk, or it may be extended to form a comfortable couch.

Educational.

[Written for the Rural New-Yorker.]

SELF-MADE, SELF-EDUCATED MEN.

"No man can be made a scholar—no one can be made learned." There is no influence from without, (except persuasion,) no foreign power, which can be bro't to bear like steam or electricity, that can ever fill the mind with ideas, or deposite therein those stores of knowledge that are necessary to make the scholar—the truly learned man.

The teacher may solve or remove difficulties, may suggest subjects of study or trains of thought, and in many ways aid the young aspirant after knowledge, but he can never make him a great scholar—a learned man. This must be his own work.

An extensive library, much reading, especially if miscellaneous, will not of themselves make a learned man. Indeed, a great library may rather prove a hindrance than a help, by dividing the thoughts among too many objects. Hence great miscellaneous readers are not generally great scholars. They may have an extensive amount of general information, and yet not be truly learned.

To become learned requires close, deep, investigating thought. Whatever is made a subject of study, must be investigated and studied, and pondered, until it is fully understood, and the ideas become our own—till a plan of the whole subject lies clearly before the mind's eye; so that we can ever suggest "additions, corrections, or alterations," if the subject admits; or at least discover its perfection without them.

Almost any one can be a scholar, and become learned, if resolved to be. Let him first learn to think, to observe, and to investigate and the work is already half done. How many young people there are who waste their time, bury their talents, and it may be said, destroy their intellect, and go through life and down to the grave in obscurity if not in disgrace, who might otherwise have been ornaments to society and blessings to the world.

Oat West, Aug., 1854. H.

MENTAL IMPROVEMENT.

The season of the year has again returned, when those who have a taste for intellectual enjoyments, or aspirations for mental culture, may more readily gratify the cherished desires of their hearts, than at any other period of the year. With the mass of people, whose days are given to physical toil, winter is the great season for mental improvement. The frosts that bind the outer world in death-like repose, and set a seal upon nature's grave that only the vernal solstice can remove, also serve to quicken and stimulate the mind, and to prepare it for the culture it needs and craves.—The winter of the physical world, is the spring-time and harvest-season of the mental. The lengthening evenings, and the bracing, energizing air,—imparting unwonted vigor to mind not less than body,—alike invite to intellectual pursuits. Happy will those be who make a good use of these leisure hours, and of the superadded mental force which usually accompanies a northern winter.

Many of our younger readers, who have toiled hard upon the farm or in the shop for six or eight months, will enjoy school privileges, during the coming winter. If wisely improved, these privileges may exert a most happy influence upon all who are favored with them. But there are doubtless others, among our readers, who feel the need of mental culture, and yet cannot avail themselves of the benefits of the common school or the academy. To such we beg leave to recommend *a term in the school of self-instruction.* This is an institution which, in our country, is open to all, without money and without price. The only condition of membership is application; and in proportion to the diligence of that application, will be the progress of the pupil.—While we would not disparage the common school, the academy and the college, we hold that it is a truth, pervading every department of human effort, that success in an undertaking does not depend so much on the enjoyment of great facilities, as on *making the most* of such as we can command. How often does the man of a few opportunities and scanty privileges for the attainment of knowledge, outstrip those who have been almost smothered by favoring fortune, in the distribution of her gifts! Unlike the result in the parable, the one talent of opportunity often increases faster than the ten. Or, to use another familiar Scripture figure, the seven lean and ill-favored kine not only surpass, but swallow up their seven well-favored and fat brethren.

No one, whose evenings are his own, should complain of want of time for mental culture. Let these valuable hours be devoted wisely and faithfully to the acquisition of knowledge, and the result, even of a single winter's effort, will be far from insignificant. There should be a definite purpose in view and a particular course of study marked out at the beginning: and every effort should be so directed, as to swell the grand result. An hour or two spent every evening in desultory reading, or in hearing miscellaneous lectures, will be of little benefit. This is literary dissipation, not culture. It may be an agreeable way of killing time, but hours thus spent can hardly claim to be devoted to intellectual improvement. To accomplish anything of importance, there must be a definite aim, and a patient concentration of effort towards the attainment of that object.

About sixteen years ago, a party of young men in a town in this State, who felt the need of mental culture, formed a private lyceum, and met from night to night, with closed doors, for mutual improvement. The best educated among them had cyphered about half through Adams' Arithmetic, and had a little knowledge of parsing, and of the other elementary branches usually taught in our public schools. The members persevered in their studies, and assisted by the stimulating effect of numbers, and the advantages of mutual aid, they made good progress. The first result of these attempts at self culture was seen in the town-meetings. Before, a few old codgers had managed the town's affairs, and by common consent had everything their own way; but now there were young men who had the presumption to take part in public matters. One of these ancient representatives of fogyism became at length so vexed at this alarming development of youthful talent, that he publicly declared an old man could not speak in meeting, but up popped a young one, to argue a point or offer a suggestion. Since that day, one of those young men, whose early life was spent in poverty and ignorance, has occupied a seat in the Senate of the State, and is at the present time a candidate for a still higher office. Another member of that humble band is a postmaster, and the president of a railroad company; and most of the others, we are told, now hold honorable positions in society, and have been elected to offices of honor and trust by the people.

Such instances are by no means rare, and they are full of encouragement to those who are striving to make the best of limited means of self-culture. It may not be convenient, nor even desirable, in all cases, to take possession of the social principle, in the pursuit of this object. No man, therefore, need wait for a mutual aid society, to help him in this work. If he has a true love of knowledge, he will pursue his evening studies with as much diligence, and perhaps as much profit, at home his own fireside, as he could in the lyceum or the school.—*New Eng. Farmer.*

MAN LIKENED TO A BOOK.

Man is, as it were, a book; his birth the title-page; his baptism, the epistle dedicatory; his groans and crying, the epistle to the reader; his infancy and childhood, the argument or contents of the whole of the ensuing treatise; his life and actions, the subjects; his crimes and errors, the faults escaped, his repentance the correction. Now there are some large volumes, in folio, some little ones in sixteens, some are fairer bound, some plainer; some in strong vellum, some in thin paper; some whose subject is piety and godliness, some (and too many such) pamphlets of wantonness and folly; but in the last page of every one there stands a word which is *finis*, and this is the last word in every book. Such is the life of man; some longer, some shorter, some stronger, some weaker, and some fairer, some coarser, some holy, some profane; but death comes in like *finis* at the last, to close up the whole; for that is the end of all men.—*Fitz. Geoffry.* 1620.

Prussia and her University.—In the moral and intellectual history of modern times, there is no event more striking and instructive than the majestic stand made by Prussia, after its disastrous overthrow by Napoleon at Jena. The monarchy was all but ruined,—on the very brink of dismemberment,—when the sagacious statesmanship and far-seeing wisdom of Stein and his noble associates, established the University of Berlin,—for the expressly avowed purpose of elevating the character of the people, and thereby enabling the nation to throw off the yoke of France. The tree thus planted, within ten years yielded fruits. The spirit of the community was revived and rekindled.—Prussia was disenthralled,—and the University stands, with its one hundred and fifty professors, and four thousand students, a monument of the wisdom of its founders, and will stand while letters endure.—*Duty of Columbia College: by a Trustee.*

Singular Contrast.—It is worthy of notice, that only a few years before George the Second founded Columbia (then King's) College, he had established a similar institution, in another part of his dominions. In the little town of Gottingen in Hanover, a German province of scanty resources, without commerce, almost without a city, and often scourged by war, he planted a seat of learning, that came into life the competitor of his twin brother in the Western World. In 1825, less than one hundred years from its birth, it had 89 professors, 1545 students, and a library of three hundred thousand volumes, and it stands proudly aloft, among the great heacon lights of the intellectual world. The catalogue of Columbia College, in this the hundredth year of its existence, shows one hundred and forty students, and six professors.—*Ibid.*

Books.—God be thanked for books? They are the voices of the distant and the dead, and make us heirs of the spiritual life of past ages. Books are the true levellers. They give to all who will faithfully use them the society, the spiritual presence of the best and greatest of our race. No matter how poor I am; no matter how poor I am; no matter though the prosperous of my own time will not enter my obscure dwelling. If the sacred writers will enter and take up their abode under my roof, if Milton will cross my threshold to sing to me of Paradise, or Shakspeare to open to me the worlds of imagination and the workings of the human heart, and Franklin to enrich me with his practical wisdom, I shall not pine for want of intellectual companionship; and I may become a cultivated man, though excluded from what is called the best society in the place where I live.—*Channing.*

I hold it to be a fact, says Pascal, that if all persons knew what they said of each other, there would not be four friends in the world. This is manifest from the disputes to which indiscreet reports from one to another give rise.

The Essayist.

[Written for the Rural New-Yorker.]

THE MILKY-WAY.

BY D. A. ALBEY.

When we look out upon the spangled vaults of heaven on a clear night, a long brilliant train or pathway of light may be seen extending entirely across the starry heavens, forming a luminous zone, which, from its singular appearance, has long been known as the Galaxy or Milky-Way.

Many strange theories were entertained by the ancient philosophers and poets respecting the origin and nature of this singular phenomenon. Some believed that it was once the sun's path, and that its luminous appearance was caused merely by the shining rays that lingered behind as it swept on in its rest journey; others, that it was the celestial path which led to the throne of Jupiter, and that its golden pavements were continually swept by the feet of their deities. But the light of Science has dissipated these superstitious notions, and in place thereof developed realities which are in keeping with the rapid march of intellect.

It is one of the grand achievements of Astronomy that has resolved this great nebulous zone into millions of distinct stars, whose feeble rays mingling together give rise to that beautiful belt of light which encircles the blue of evening, while earth is shrouded in the mantle of darkness.

It is very generally believed that our sun belongs to this extensive cluster or nebula, and although so immensely distant from it that light must be for ages in winging its silent and lonely flight to those distant orbs, yet it is, doubtless, as near to any one of them as they are to each other.

Of the number, the magnitude, and the movements of the stars that compose this mighty group, we have but very little definite knowledge;—they are too far back in the regions of space for the researches of finite beings; and we can only gaze upon them in silent admiration as they sparkle so mildly from their silvery thrones, far, far away from earth in the realms of infinity,—but know no more.—The great Herschel, however, succeeded in penetrating, with his vast telescope, so far into the illimitable depths of space as to behold the stainless blue that lies entirely beyond this milky haze. On a clear evening, he brings his powerful reflector to bear upon the luminous zone, and stars, hitherto unknown, glitter upon its shining surface; he increases the space-penetrating power of his instrument, and other stars, still farther back, spring, as it were, into being; again and again he renews his efforts to sound its mighty depths, but with the same results as before,—that milky haze still lingers beyond, while thousands of beautiful stars glitter like gems in its radiant crown. Finally, he brings to his aid the full power of his ponderous telescope to enable him to pursue his flight still deeper into the almost unfathomable abyss of this lucent zone; when, lo! the nebulous haze has disappeared, and naught but the deep, unclouded blue of heaven rolls beyond, while millions of stars glitter like jewels on its pure, transparent bosom. The great problem that had baffled the skill of the mightiest intellects for ages, was solved, and the Milky-Way assigned its limits! The stars composing this immense cluster are found to be ranged one behind the other, *five hundred deep*; and though long and weary ages must circle away ere light can traverse the mighty interval that separates us from the nearest star that gems this radiant zone; yet each is, perhaps, no nearer to the other, and may be subject to the same laws of gradation. Then with what line shall we measure the mighty interval that separates us from the star that marks the limits of this vast nebula?

Of all the visible constellations that garnish the siderial heavens, the Milky-Way holds the pre-eminence, and fills the mind with the loftiest conceptions of magnitude and sublimity. When we consider what countless millions of suns and systems compose this mighty group, whose distance is so great that the most powerful telescopes can scarcely separate the rays of their mingled twilight into distinct points, we fall as far short of adequate language to express our ideas of such sublimity and grandeur as we do of instruments to measure and compute their elements.

That each one of these countless stars or suns forms the centre of a complete planetary system, affording light and heat and the agreeable change of day and night to its surrounding worlds, peopled with an innumerable host of intelligent beings, all dependent upon God's own hand, will scarcely admit of a doubt; for it would be derogatory to the character and infinite wisdom of the All-wise Creator, to suppose that these immense globes of light were merely designed to adorn the curtains of darkness, and shed a few glimmering rays upon this insignificant earth or atom, as it were, of the universe, or to sparkle with such pure serenity upon the stainless bosom of the upper deep, affording material for the dreamy speculations of philosophers and astronomers.

When the mind wanders over the interminable range of the universe, everywhere besprangled with myriads of gigantic suns and worlds—all moving in silent harmony through the dark realms of ether, perpetually submissive to the laws that govern them, and constantly requiring the watchful care and superintending power of the Great Ruler of the universe, who regulates their harmonious movements and takes care of the most insignificant creature that inhabits the most distant world, we are lost in the stupendous labyrinth of Creation, and can only contemplate in silence the exalted wisdom and omnipotence of Jehovah; for silence is the only language that befits man, whose words are no longer eloquent Well may we exclaim with the Psalmist, when contemplating the glories of Creation, "O Lord, how manifold are thy works; in wisdom hast thou created them all."

Useful Olio.

TAME WHALE.

An Eastern traveler, in a newly published work entitled "Notes of Travel," relates the following singular fact, which came under his observation at Muscat. No visitor to the harbor is better welcomed by the natives than "Muscat Tom." This name has been given by sailors to a male fin-back whale which has made it an habitual practice for over forty years to enter, feed and frolic about the cove several hours in each day, always leaving before night. Sometimes a smaller one of his tribe, supposed to be a female, accompanies him. His length may not be less than seventy feet, and that of his companion fifty feet. Since his arrival signalizes the departure of the sharks which infest the waters of the harbor to the prevention of sea bathing by the natives, the most strenuous caution is observed not to interfere with his pursuits and diversions. He shows no fear of such vessels as trespass upon his watery field.

One day as he came rolling leisurely and jollily alongside of a vessel at anchor in the harbor, and on board of which I was, one of the crew threw with considerable impetus a stick of wood into his open mouth, as he raised his head out of the water. This breach of the good treatment which he had been wont to receive, did not draw any signs of displeasure from his whaleship, although more than one malediction was bestowed upon the imprudent tar, by exasperated natives who had observed his censurable conduct.

PROPERTIES OF GLASS.

Glass has properties peculiarly its own; one of which is that it is of no greater bulk when hot, or in the melted state, than when cold.—Some writers state that it is (contrary to the analogy of metals) of greater bulk when cold than when hot.

It is transparent in itself; but the materials of which it is composed are opaque. It is not malleable, but its ductility ranks next to gold. Its flexibility also is so great that when hot it can be drawn out like elastic thread miles in length, in a moment, and to a minuteness equal to that of the silk worm. Brittle, also, to a proverb, it is so elastic that it can be blown to a gauze-like thinness, so as easily to float upon the air. Its elasticity is also shown by the fact that a globe, hermetically sealed, if dropped upon a polished anvil, will recoil two-thirds the distance of its fall, and will remain entire until the second or third rebound. Vessels called bursting glasses are made of sufficient strength to be drawn about the floor; a bullet may be dropped into one without fracture of the glass; even the stroke of a mallet sufficiently heavy to drive a nail has failed to break such glasses. In a word, ordinary blows fail to produce an impression upon articles of this kind. If, however, a piece of flint, cornelian, diamond, or other hard stone, fall into one of these glasses, or be shaken therein a few moments, the vessel will fly into a myriad of pieces.

Statuary at the Capitol.—The *Washington Sentinel* remarks that the eastern side of the Capitol in Washington is, and probably will continue to be, the field in which to display the marble statuary procured by Government munificence. Among the various sculptures with which it is adorned, are two which stand on either side of the great entrance door from the portico to the rotunda, one being the figure of War, and the other the figure of Peace. Peace is a maiden clad in simple, flowing garb, represented in the act of extending to her warlike neighbor an olive branch which he does not seem disposed to accept. The statue of War is nine feet in height, and that of Peace in proportion. The figures are sculptured in Carrara marble. On the southern abutment of the grand steps is the group of the "Discovery of America," consisting of two marble figures, one of which is an Indian maiden looking up to a figure intended for Columbus, holding in his outstretched hand the globe. All of the above were the work of Persico.

Cheerfully acknowledge merit in others, and in turn you will always receive that kind consideration which you desire. When you cannot consistently praise, by all means remain silent, unless there be a manifest wrong, deserving censure.

One of the greatest evils of the world is, men praise rather than practice virtue. The praise of honest industry is on every tongue, but it is very rare that the worker is respected more than the drone.

Sunday Reading.

[Written for Moore's Rural New-Yorker.]

THOUGHTS.

BY IDA FAIRFIELD.

A garden there is, in the Heavenly land,
Where the seed is bound for the harvest time,
And thither is borne, by angel wings,
Each germ of the soul—each thought sublime.

A ladder there is, whose golden top,
Just fades away, in the sun-bright clouds,
And silently every round is pressed
By spirits who walk in their silvery shrouds.

Daily and hourly they come and go,
With tireless wing and vigilant care,
And every thought, from its shadowy cell,
To the chambers of radiant light they bear.

Then tremble, oh mortal! thy thought is heard,
Though whispered low, in thy secret soul—
Its echo in other and far-off worlds,
Through endless cycles of time shall roll.

From thy passion hours is forged a chain,
Enwreathed with the light of thy fancy's glow,
Which links thy spirit to beauty above,
Or binds then with adamant fetters below.

Then linger thou long in the solemn groves,
Where holy religion her altar uproars,
Where the sacred fire of humanity glows, [tears.
And the dew-gems which glisten are sympathy's

Bind to thy spirit that Heavenly faith
Which shrinks away to the coming time,
Triumphing ever o'er sin and death,
All-conquering, glorious and sublime.

So shall thy thoughts as they Heavenward roam,
Bear thee in their pathway of radiant light,
Till around thee the day-beams of beauty and joy,
Shall dispel every shadow of earth and of night.

Independence, Nov., 1854.

[Translated from the German for the New-Yorker.]

THE GREATEST TREASURE LOST.

A teacher once related the following to his pupils:—A thief broke into a palace. On seeing the rich treasures which lay spread before him, he stood as if rooted to the floor.—He revelled in the enjoyment of beholding such a vast number of precious trinkets of gold and silver, and was deliberating upon the objects he would select. Here a large diamond, set in a crown, flashed like lightning; there a diadem beset with jewels glittered. On all sides was dazzling splendor! He had already stretched his defiled hand to grasp some treasure, but he withdrew it again and again, for some still more splendid object continually attracted his sinful covetousness. At length he sees another door; he rushes through it to the adjoining room. Is it mere magic show and deception that bursts upon his view? The wealth of many kingdoms seems to be gathered here! Tables, chairs, chandeliers and vases of massive gold, embossed with the most precious stones and pearls! Everything glistens as in a land of fairies, and the eye of the thief feasts on the countless beaming beauties. But he does not linger long in this mansion of magnificent lustre, but heedlessly rushes along from apartment to apartment. Everywhere unheard of riches meet his eye. He still struggles with himself, not satisfied as to what he should seize. Suddenly he hears loud steps, and the watch-word of the guards. The day has dawned, and the thief must now look for his own safety. And thus he is obliged to leave behind all the gorgeous wealth, and would be glad if he could only save his naked life.

After a brief pause, during which his pupils looked up for an explanation, the teacher continued:—Thus it is with man. He enters this world, a palace of magnificence and glory.—What is there sweeter than life on this earth so full of beauty and grandeur, brightened by the beaming fire of the sun? Yet he rushes from pleasure to pleasure and hastens to every enjoyment. The possession of one blessing will not satisfy him, but will lead him to demand more. He knows not what to seize and retain for his own. Like the thief, he casts away the pearls in order to grasp the diamonds. Virtue and justice, love towards God and man, benevolence and upright dealing, are left far in the rear of his continual longings for sensual pleasures. And as the day suddenly breaks upon the thief, so death at last comes upon him, and he stands before the all-powerful Creator, naked as when he came into life, devoid of the wealth which he amassed in this world, empty and discontented, lamenting the last days of his life. S. F

A FRAGMENT.

When I look upon the tombs of the great, every emotion of envy dies within me; when I read the epitaphs of the beautiful, every inordinate desire goes out; when I meet with the grief of parents upon a tombstone, my heart melts with compassion; when I see the tombs of parents themselves, I consider the vanity of grieving for those whom we must quickly follow; when I see kings lying by those who deposed them; when I consider rival wits placed side by side, or the holy men that divided the world with their contents and disputes, I reflect with sorrow and astonishment on the little competitions, factions, and debates of mankind; when I read the several dates of tombs, of some that died as yesterday, and some six hundred years ago, I consider that great day when we shall all of us be cotemporaries, and make our appearance together.

Miscellaneous.

WATER PLANTS.

BY ELIZABETH J. EAMES.

The wilding buds, and culture'd flowers
Are beautiful to view—
And the blossoms born in Tropic bowers
Are rare and rear'd by few!
The forest trees in foliage green
The Mountain Mosses gray,
The tufted grass in dew-pearl'd sheen,
Oh! beautiful are they!

But lovelier than buds and flowers,
And Iropic blossoms rare—
Those children of the waves and bowers
The Water Flowerets are!
By babbling brook, and singing stream,
By forest, lount and pool—
By rivulet and mountain rill—
And well-spring deep and cool—
Upon the lovely lakelets side,
Along the river shore,
They lift their heads in graceful pride
Or bow the waters o'er.

So where that stately river queen
The *Lady* lifteth up
(Array'd in snowiest velvet sheen,)
Its alabaster cup:
The purple *Cowslips* dip its leaves
In the clear brook below,
And the *Callla* with the *Crowfoot* weaves
Its blossoms white as snow.

The azure-hued *Mallows-bud*
Stands on the river brink
And, dipping neath the crystal flood,
The *Flag-Flower* stoops to drink;
The water white *Ranunculus*
Are rang'd around the pool,
With the tender leaf'd young *Water Cress*—
And flowering grasses cool!
The frail and fairy *Harebell* rings
Her silvery pealing chime,
And the stream-loving *Cowslip* sings,
In soft accordant rhyme.

The slender little meadow rill
Is dress'd in *Poem-like Flowers*,
Over the turf-edged valley still
The *Orchis* falls in showers:
For miles along the wood streams side
Bends *Lady Fern* and *Brake*,
And the blue *Geranium* far and wide
Is scatter'd o'er the Lake!

The rose-hued *Lythrum* blooms around
The fountain's mossy brim,
And the dew-wet verdurous bank is crown'd
With *Violets* sweet and dim.
About the lonely forest pond
Doth droop the *Adders Tongue*,
And the *Mossy Work* is nearly
Upon its borders hung.
Over the tiny runnels edge
The *Fox-Glove* nods her head,
The wild *Pink* and the wealthy *Sedge*,
Their leaflets o'er it shed!

Arising from the swelling sod
Around the clear cool spring,
The *Alder* green, and *Golden Rod*,
Their freshest tribute bring
And filling 'twixt the shore and land
Its own peculiar place,
The yellow flowering *Mustard* stands,
In blithe and pliant grace:

Yes! beautiful are Water Flowers—
Around their color'd stems
Are flung in silvery gleaming showers
A thousand sunny gems:
In sparkles of the diamond dew—
In lucent pearls glistening white,
In trembling wreaths of fairy spray,
Fill'd with a rainbow light,
While jewel'd with a thousand rings
Their leafy fingers shine,
And prism-hued beads on golden strings,
Round twigs and branches twine.

Yes! wilding buds, and and culture'd flowers
Are beautiful to view—
And the blossoms born in tropic bowers
Are rare, and rear'd by few;
But lovelier than all flowers and buds
Or leaves and mosses rare,
These children on the waves and floods
These Water Flowerets are!

[For the Rural New-Yorker.]

MUSIC FROM MEMORY'S HARP.

Lightly touch those sacred strings; we would listen once more to their thrilling melody. Breathe not of sadness, wondrous harp! for now we would hear of the bright and sunny past—of the blissful dreams of joyous youth, when Hope and Love were young,—start to the music of the Past; 'tis not sad, not mournful, but so full of bliss that the eye unconsciously fills with tears. It recalls the time when we strayed through the forest, with hearts as free as the "mountain bird which ne'er had fetters known;" with souls as pure as the bright flower which scarcely bowed beneath our fairy tread; when we listened to the warbling of the woodland songsters—we tho't they had wandered from the bowers of Paradise, to sing those heavenly strains on earth.—In the murmur of the silver stream that glided o'er its pebbled way, in the rustling of every forest tree, there seemed to come a voice from the "Spirit land." We were happy then; the Future full of promise—the Past a fairy dream. We knew not of the care and weariness of life; we knew not sin had cast its withering blight o'er all the beauteous things of earth.

We would linger on those blissful memories—but now the strain recalls the time—when childhood was merged into budding youth—The heart beat high with warm hopes of the Future, and we longed to go forth and take an active part in the ever-changing drama of life—we feared not the cold, rude blasts of earth, for we saw only the bright and sunny skies, and heeded not the few clouds that floated o'er them. We thought 'twas strange that life was called a weary, toilsome way, for to us it seemed all bright and joyous. We listened to the tale of blighted hopes and crushed affections, with a sigh,—yet dreamed not that they would e'er be ours; we ever reveled in the sunlight of happiness. O! bright, budding hopes, ye yet linger around us—casting a halo of heavenly light, but we fear the gathering storm, we fear the approaching darkness which may obscure your radiance. O! fairest flowers of earthly bliss, ye yet bloom along our pathway, shedding the rich perfume of love and joy upon our hearts, but we fear the chilling breath of sorrow, which may ere long cast a withering blight upon your beauty.

We love to listen to memory's glad strains—and now they tell us of the time when the heart first felt the power of youthful love.—Soft and sweet thy music now. O, wondrous Harp! we would linger on those blissful strains, for O, how sweet their lightest cadence.—How sweet to recall the time when the young heart yielded at the sacred shrine, Love's purest offering. We would fain dwell forever on those blissful memories; forever live in the light of that happy dream.

But a strain of mournful melody steals from memory's Harp. Alas! that a cloud should e'er obscure that radiant theam. Oh! why should that brightest beam of earthly light go down at last in darkness? But still a voice of hope breathes from the Past, and the music is an echo of a strain sung in the Better Land.

Wyoming Co., N. Y. H. D. T.

"A WELL ORDERED HOME."

These words are a "home thrust" to many in practical lessons of wisdom. The relations of husband and wife, parents and children, and brothers and sisters, are all embraced within their meaning. To the husband, love, kindness, honesty, sincerity and forbearance towards the chosen partner of his life, are essential.—To the wife, a loving heart, a cheerful home; "bright fires instead of black stoves," smiles of welcome, devotion and obedience, mutual forbearance, mutual interests, a cultivation of mutual tastes, pursuits and studies, a love of the beautiful and true. To parents, fixed rules of government for children, founded on justice and mercy, whose fruit is love, recognizing and strictly observing the rights of the child, as scrupulously as they demand obedience; to cultivate order and system in all things, and a taste for the useful and beautiful, instead of follies and frivolities—all these are equally essential.

Provide amusements for children, if you would keep them from seeking it away from home.

Make the house cheerful and happy and desirable, if you would have it irresistible to the members of it. Discard the austerity and cold stiffness of formality, but observe all the true and genuine politeness of honesty, hearty humanity, which teaches us to "do unto others, as we would that others should do unto us," and "love one another." Such a home should every christian family be. Then the seeds of piety, honesty, uprightness, cheerfulness, and elevated happiness, sown and nurtured in the home would spring up and grow and multiply, as the different members of these families radiated to all points of the compass like a halo of glory, and "peace on earth, and good will to man" would be the glorious result.

"I DID AS THE REST DID."

This tame, yielding spirit—this doing "as the rest did"—has ruined thousands.

A young man is invited by vicious companions to visit the theatre, or the gambling room or other haunts of licentiousness. He becomes dissipated, spends his time, loses his credit, squanders his property, and at last sinks into an untimely grave. What ruined him? Simply "doing what the rest did."

A father has a family of sons. He is wealthy. Other children in the same situation of life do so and so, are indulged in this thing and that. He indulges his own in the same way. They grow up idlers, triflers and fops. The father wonders why his children do not succeed better. He has spent so much money on their education, has given them great advantages; but alas! they are only a source of vexation and trouble. Poor man, he is just paying the penalty of "doing as the rest did."

This poor mother strives hard to bring up her daughters genteelly. They learn what others do, to paint, to sing, to play, to dance, and several useful matters. In time they marry; their husbands are unable to support their extravagance, and they are soon reduced to poverty and wretchedness. The good woman is astonished. "Truly," says she, "I did as the rest did."

The sinner, following the example of others, puts off repentance, and neglects to prepare for death. He passes along through life, till, unaware, death strikes the fatal blow. He has no time left now to prepare. And he goes down to destruction, because he was so foolish as to "do as the rest did."

Look at home.—As a general rule it will be found that our greatest sources of unhappiness are within ourselves, and if we fail to live harmoniously with others we shall act more wisely to set about correcting our own faults than to pick flaws in thier characters. Make the fountain pure and the stream will flow clearly along, even though it must pass dark forests, lonely chasms, and rough shores.

Self Control.—To live happily with others we must first learn to live happily with ourselves. He who rules his own spirit well, can so adapt himself to the shifting phases in the life of his friends as never to be drawn into harshness, never to do violence to the feelings or tastes of those who are bound to him by the sacred ties of friendship or love.

Ladies' Department.

CONDUCTED BY A——E.

ODE ON THE GREEK SLAVE.

BY AUGUSTIN DUGANNE.

O Greek! by more than Moslem fetters thrall'd!
O marble prison of a radiant thought,
Where life is half recall'd,
And beauty dwells, created, not enwrought,—
Why haunted thou my dreams, enrobed in light,
And atmosphered with purity, wherein
Mine own soul is transfigured, and grows bright,
As though an angel smiled away its sin.

O chastity of Art!
Behold! this maiden shape makes solitude
Of all the busy mart;
Beneath her shroud's immeasurable woe,
All seasons vision has subdued,
And from her veiled eyes the flow
Of tears, is inward turned upon her heart;
While on the prisoning lips
Her eloquent spirit swoons,
And from the lustrous brows' recline
Falls patient glory, as from clouded moons!
Severe in vestal grace, yet warm
And flexile with the delicate glow of youth,
She stands, the sweet embodiment of truth;
Her pure thoughts clustering around her form,
Like seraph garments, whiter than the snows
Which the wild sea upthrows.

O Genius! thou can'st chain
Not marble only, but the human soul,
And melt the heart with soft control,
And make such reverence in the brain,
That man may be forgiven,
If in the ancient days he dwelt
Idolatrous with sculptured life, and knelt
To Beauty more than Heaven!

Genius is worship! for its works adore
The infinite Source of all their glorious thought,
So blessed Art, like Nature is o'erfraught
With such a wondrous store
Of hallowed influence, that we who gaze
Aright on her creations, haply pray and praise!

Go, then, fair Slave! and in thy fellers teach
What Heaven inspired and Genius hath designed:
Be thou Evangel of true Art, and preach
The freedom of the Mind!

Trans-Atlantic Epistles,

TO COUSIN KATEY.

Communicated thro' Moore's Rural New-Yorker.

EPISTLE FOURTEENTH.

Reflections in the *Museo Borbonico*—Similarity between antique and modern household implements—Ascent of Mt. Vesuvius—Guides—Fields of Lava—Hermitage—*Lachryma Christi*—Climbing the cone—Four men and a boy to help—Appearance of the crater—Descent and return to Naples.

Dear Katey:—My last letter was devoted to an account of the trials and vexations thro' which we passed in reaching the fair city of Naples—you will be glad to learn that we were fully compensated by the pleasure which our stay here afforded us for all these *desagremens*. But do not be alarmed, Katey, lest I should *bore* you by any attempts at describing this famous city, or the curiosities which it contains. I am not possessed of sufficient energy at this present writing to undertake so formidable a task, and besides consider it quite unnecessary, for if you should really wish to post yourself up on these matters, I will lend you *Murray*, after our return, where you will find everything set forth and enlarged upon after the most approved style. *En passant*, let me impart to you, however, some of my reflections in the *Museo Borbonico*, one of the *lions* of Naples, while examining the collection of small objects in bronze, found mostly in Herculaneum and Pompeii. We talk of human progress, of the advancement of the age, particularly in mechanical inventions and improvements; and here in these rooms, one is surrounded by the household implements, the furniture and ornaments of a people who existed nearly two thousand years ago — transported, as it were, into the midst of the home-life of the ancients. One is almost startled by the absolute identity between the greater part of these objects and those in use at the present day. Cooking utensils, stores, caldrons, lamps, lanterns, steelyards and weights, locks and keys, surgical and musical instruments, bells, pens, ink, needles, scissors, everything is here, and frequently the only difference between these *antiques* and their modern successors, consists in the more graceful forms and artistic adornment of the former. While passing through this collection I felt somewhat as in Rome, when gazing at the stupendous and yet symmetrical structures which the old Romans reared. I was convinced that people had existed, and quite comfortably and respectably too, before we boastful moderns, came upon the stage, and I was quite inclined to the opinion that these same old Romans, whom from my school days I had been accustomed to regard as a semi-barbarous nation of warriors, were, in many respects, the noblest race which this earth has ever produced. If all "Young America" could be sent to school in Europe a while, I fancy it would learn some useful lessons, and the conviction of its *exceeding youth*, which would grow upon it from day to day, might perhaps check the presumption for which it is at present unhappily famous. But enough of this moralizing, and, by way of variety, let me relate to you my adventures in ascending Vesuvius, which *border*, to say the least, on the comic.

We left our carriages at Resina, a little village on the coast of the bay, and I mounted a donkey to make the ascent of the mountain as far as the cone. Another lady of the party selected a horse, but I sagely opined that the *long-eared* animal would be the *surer-footed* of the two, and accordingly honored him with the preference. Just fancy me, Katey, perched on my donkey, with a dark-eyed, melancholy-looking Italian officiating as guide. His post was properly at my bridle, but he had an invincible propensity to fall behind, and, (shall I say it?) attach himself to the *caudal appendage* of the poor donkey, who was thus compelled, besides carrying me, to drag him also up the mountain. This is a universal practice with the guides who attend animals on such excursions, and our cavalcade of ten or twelve in number, bestriding beasts of all sizes and qualities, and all, or nearly all, with such a footman at their heels, was a mirth-provoking sight.—We wound slowly up the mountain side, passing first through rich vineyards and orchards, then through waste grounds, clad with a coarse and scanty vegetation, till finally this disappeared and we entered upon the fields of lava, which stretched black and frowning before us to the summit of the crater, without a green leaf or living creature to soften their utter desolation. These lava fields differ in one respect from the picture which my imagination had already formed of them. I supposed the streams of lava as they rolled slowly down the mountain side, and gradually cooled and hardened, would be characterized by a somewhat smooth uniform surface. This is not the case, but the lava lies in large, irregular fragments, and the general appearance is quite similar to that of a field newly broken up by the plowshare.—We toiled slowly up the rugged path which conducts through these dismal solitudes, refreshing ourselves with many a backward glance at the enchanted prospect spread out beneath us, and at length reached the Hermitage, a monastery inhabited by a few monks and situated on a little eminence about three-quarters of a mile from the foot of the cone. Here we were expected to dismount and take some refreshments, or at least taste the famous wine grown on the sides of Vesuvius, and called *Lachrymæ Christi*, an appellation which sounds strangely like profanation to a Puritan ear. My Italian attendant very significantly intimated that it was customary to furnish a bottle of wine to the guides on such occasions.

After a few moments spent at the Hermitage we were once more "en route," and soon found ourselves at the foot of the cone, where we dismounted and left our animals under the care of one of the guides. Here came the tug of war. The ascent of the cone is exceedingly difficult, the inclination being very steep, and the path lying either through loose ashes which slide back at every step, or over projecting masses of lava, which afford a surer foot-hold but are at the same time quite rough and unpleasant to walk upon. A sort of chair is provided, in which those who choose this mode of conveyance may be carried to the top without any personal exertion. But no such inglorious mode of mounting Vesuvius would serve my turn. With genuine *Yankee spunk* I was determined to go up myself, *on foot*. So forth I set, but it did not take long to cool the ardor of my zeal, and make me cast a wistful glance back at the easy conveyance which I had so indignantly spurned. It is the business of the guide who accompanies you from Resina to assist you in mounting the cone.—This he does by means of a leathern strap, one end of which he gives you, while he secures the other about his person, and, as he advances, drags you up after him. A half-dozen or more Italians are always in waiting at the foot of the cone, ready to offer their services as bearers of those who wish to be carried, or as additional aids to those who go on foot. I started very courageously with my one guide, pulling me along by the leathern strap, but several of the supernumerary attendants followed in the rear, shrewdly suspecting their services would be called into requisition. As my pace slackened and I showed symptoms of weariness, one of them advanced to my side and took my arm to give me additional support and assistance. Soon another installed himself upon the other side, and finally a third commenced pushing me from behind, a species of aid which I had not the heart to decline, however incompatible with my dignity I might have deemed it under other circumstances.—To cap the climax, a boy took possession of the shawl which I carried with me as a protection against the cool air after reaching the summit, and thus aided and escorted by four men and one boy, I succeeded, after frequent pauses for breath, in gaining the summit.

Recollect, Kate, all this is in strict confidence, for when I get home, and speak of ascending Vesuvius *on foot*, I shall be very careful not to say anything about the *four men*, or even the *one boy*. And now I suppose you are ready to ask what I saw on the top of the mountain to repay me for all this toil. I certainly obtained a more vivid idea of the infernal regions than I ever had before, or wish to have again. Clouds of smoke and vapor, through which you dimly see the forms of your companions flitting to and fro, like shades upon the banks of the Styx, dark abysses yawning at your feet, from which the stifled moanings of the restless volcano faintly fall upon your ear, burning ashes beneath you, and sulphureous vapors filling the air to suffocation; all these all in making up the picture. It is a strange, unearthly spot, one that makes an indelible impression upon the mind, and, once seen, can never be forgotten.

Our guides hastened us away, for the day was fast waning, and the weather becoming threatening. The descent of the cone was as easy and expeditious as the ascent had been tedious and difficult. We took the path which lay through the loose sand and ashes, and ran almost at full speed, though sinking at every step ankle-deep. The very sliding of this unsolid foundation was an effectual check upon the impetus acquired by our motion, and in this way we soon reached the place where our animals had been left, re-mounted them and commenced retracing our steps down the mountain side. Now we were at liberty to enjoy the beautiful view before us at leisure, and we feasted our eyes upon this unrivalled panorama until the darkening twilight hid it from our sight. The remainder of the ride passed in silence, except that one of the donkeys lifted up his voice at intervals, and gave utterance to such discordant sounds that the good Doctor, also an American, who was mounted upon him, almost leaped from his seat in affright, fancying he heard the roar of the awakening volcano, the prelude to a new and terrible eruption. At Resina we gladly resumed our seats in our comfortable carriages, and were soon whirled back to our hotel, where a good dinner and a smiling host awaited us.

Affectionately yours, Minnie.

A FAIRY TALE.

Once upon a time, just before the monkey tribe gave up the nauseous custom of chewing tobacco, there lived an old hag, who had conceived an inordinate desire to eat an elf; a circumstance, by the way, which indubitably establishes that elves were of masticable solidity, and not, as some one has it, mere

"*Shadowy* dancers by the summer streams."

So the old lady went to the place where the fairies dwelt, at the hill-top.

"Pretty little Jip," said she, "come and see the sack of cherries I have brought thee, so large, so red, so sweet."

Fairies, be it known, are extremely fond of this fruit; and the elf rushed out in eager haste.

"Ha! ha!" said One-Eye, as she pounced upon him, and put him in her bag, (witches always carry bags,) "take care the stones don't stick in thy throttle, my little bird."

On the way home, she has to visit a place some distance from the road, and left Jip, meanwhile, in the charge of a man who was cutting faggots. No sooner was her back turned, than Jip begged the man to let him out; and then filled the bag with thorns. One-Eye called for her burden, and set off towards home, making sure she had her dinner safe on her back.

"Ay, ay! my lad," said she, as she felt the pricking of the thorns; "I'll trounce thee, when I get home, for stinging me with thy pins and needles."

When she reached her house, she belabored the bag with a huge stick, till she thought she had broken every bone in the elf's body; and when she found that she had been wasting her strength upon a "kit" of thorns, her rage knew no bounds. Next day, she again got possesion of Jip in a similar manner, and this time left him in care of a man who was breaking stones by the roadside. The elf makes his escape as before; and they fill the sack with stones.

"Thou little rogue!" said the witch, as she perspired under the burden, "I'll soften thy bones nigh-hand."

Her appetite was only whetted, not blunted, by these repeated failures; and, despairing of again catching her prey in the same way as before, she assumed the shape of a pedlar, with a churn on his shoulder, and contrived to meet Jip in a wood.

"Ah! Master Redcap," quoth she, "look alive, my little man, the fox is after thee. See; here he comes. Hie thee into my churn, and I will shelter thee. "Quick! quick!" In jumped the elf. "Pretty bird!" chuckled the old crocodile, "dost thou scent the fox?"

This time, she went straight home, and gave Jip to her daughter, with strict orders that she should cut off his noddle, and boil it.—When the time came for beginning the cooking, Miss One-Eye led her captive to the chopping-block, and bade him lay down his head.

"How?" quoth Jip; "I don't know how."

"Like this, to be sure," said she; and suiting the action to the word, she put her poll in the right position.

Instantly, the fairy seizes the hatchet, and serves her in the manner she intended to serve him. Then, picking up a huge pebble, he climbs up the chimney to watch the progress of events. As he expected, the witch came to the fire to look after her delicacy; and no sooner does she lift up the lid of the pot, than "plop" came down Jip's pebble right into the centre of her remaining optic, the light of which is extinguished forever; or, according to some versions, killed her *stone*-dead.

There is something true, fanciful and sweet in the following epigram on slumber, from the Italian:

"Sweet is slumber—it is life
Without its sorrow, sin or sighing—
Death, without the fearful strife,
The mortal agony of dying.

RURAL NEW-YORKER

ROCHESTER, NOVEMBER 18, 1854.

SPECIAL NOTICES —TO AGENTS, &C.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THOSE who are forming clubs, (20 to 50 copies,) can send on the names and money of such persons as do not wish to wait, and complete their lists afterwards.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ IN remitting for clubs, please send Bank Bills or Drafts on New York (deducting the exchange,) instead of Checks or Certificates of Deposit on local banks.

☞ IN writing us, please be particular to give your P. O address correctly—the name of your Post Office (not Town,) County and State. Write all names plainly.

☞ THOSE wishing their papers changed from one address to another, should give the names of both Post Offices—the *former address*, as well as the one desired.

☞ SPECIMEN numbers of the RURAL cheerfully forwarded to all disposed to aid in augmenting its circulation. We will send to your own, or the address of friends, all the necessary documents—extra numbers, show bills, prospectuses, &c. It will afford us pleasure to respond to all requests in this line.

Recent Elections.—Results.

ELECTIONS were held in New York, Michigan, Illinois, Wisconsin and New Jersey, last week—and in Massachusetts on Monday last. The official returns are not yet received, we are enabled to give a synopsis embracing, or indicating, the result in each State.

NEW YORK has astonished a great many wise people—including sundry politicians who had apparently reckoned on a very different result from that achieved. The friends and partisans of each of the three principal candidates for Governor — CLARK, SEYMOUR and ULLMAN — probably anticipated a triumph, but the returns indicate somehow a vote that neither is badly beaten, while the majority of the successful candidate will be very meagre. Indeed, though a week has elapsed since the election (we write on Tuesday, Nov. 14,) the vote is so close between CLARK and SEYMOUR that the question as to who will be Governor can only be decided by the official canvass. Most of the New York and Albany papers figure a small majority for CLARK. The *Tribune*, however, contends that SEYMOUR is elected. So far as ascertained the following are about the aggregates:—CLARK, and SEYMOUR, each, 120,000; ULLMAN 108,000; BROWNSON, 23,600. All the Whig State Ticket, except Gov., succeeds by a handsome majority.

The Congressmen elected are thus enumerated and classed by the *Tribune* of Monday:—"Total 25 Whigs, including regular Whig candidates who had the Know-Nothing support; 2 Know-Nothings (Valk and Whitney) elected over regular Whig candidates; 1 ditto (Edwards) elected over Fenton, Anti-Nebraska Dem.; 3 Softs, including one (Williams) elected in a Whig District (Monroe) by the Know-Nothings; 2 Anti-Nebraska Independents (Wheeler and Oliver) elected on the merits of their opposition to Douglas. No Hards at all, unless the attempts to count Mike Walsh into Kelly's seat should prove successful. Total 33, of whom but *three* even affect to like Pierce, Douglas & Co., and they are not half in earnest about it.—Two years ago, Pierce had 23, the Whigs 10."

The Members of Assembly chosen, so far as ascertained, are — Whigs, 77; Democrats, 33; Temperance and Independent, 3.

MICHIGAN.—The returns are incomplete; yet sufficient have been received to show that the Republican State and Congressional candidates have all been elected by handsome majorities. In many of the counties the Republican (more properly Whig and Free Soil Fusion) county tickets have been successful.

ILLINOIS has also chosen a large majority of Fusion representatives to Congress and the State Legislature. A dispatch dated Chicago, Nov. 9th, says:—"The Legislature is entirely Whig and Anti-Nebraska. Seven Senatorial and fifty-five Representative districts heard from, and not a single Nebraska member elected yet." DOUGLAS Nebraskaism has apparently received a terrible rebuke.

WISCONSIN tells the same story.—all Republican and Anti-Nebraska. Two of the Republican candidates for Congress are chosen; and Mr. WELLS, who voted against Nebraska, is re-elected. The Legislature is Republican.

NEW JERSEY elects four Whig and Anti-Nebraska Congressmen, and one Nebraska Democrat. The new Assembly is also Anti-Douglas. The Senate (two-thirds holding over) is tied.

MASSACHUSETTS has been *taken* by the Know Nothings—the returns indicating that they have made nearly a clean sweep of the State. Boston elects 44 Know Nothing representatives to the Legislature, and 6 Senators—a full ticket—and in other towns heard from the result is similar. GARDNER, the K. N. candidate for Governor, is probably chosen by the people. The Congressmen chosen are claimed as Know Nothings. A dispatch from Springfield, Monday evening, says:—The Know Nothings have swept the State, to-day, high and dry. In some places they have swallowed up all parties, carrying all the Free Soil, and many of the Whig strongholds. The majority of their Representatives elected seem to be Whigs, and all are Whig or Republican. The Administration is nowhere, and the old parties are now entirely licked up, root and branch."

Decease of a Venerable Lady.

THE venerable widow of the lamented ALEXANDER HAMILTON, died at Washington last week at the advanced age of ninety-seven years.—Mrs. HAMILTON was the daughter of General PHILIP SCHUYLER of revolutionary memory, and was a person in early life possessed of extraordinary intellect and personal accomplishments. Married to one of the most popular and celebrated men of the time, no prospect was ever brighter for a prosperous and happy life; but the political feuds of the times subsequently involved her husband in a fatal duel with AARON BURR in 1804, and then the sun of her happiness set in blood.

HAMILTON discharged his pistol in the air, while at the same time he received a mortal wound from the weapon of his antagonist. The fate of the former was really the happiest of the two, for he died universally lamented, while Burr lived to a neglected old age, the subject of universal execration.

A cotemporary says of Mrs. HAMILTON, "she proved the truth of the axiom, 'Sweet are the uses of adversity;' and with a chastened heart, and a submissive, cheerful spirit, she has ever done what her hands found to do with a ready zeal. In company with Mrs. BETHUNE she founded the 'Orphan Asylum' at Bloomingdale, the bond directress of which she became, and for many years devoted her time, and purse, and heart in doing what she could to cheer the lives of the poor orphans who came into her establishment." Her remains were taken to the city of New York for interment.

Important to Millers.

THE Secretary of the Treasury has issued a circular giving notice to all whom it may concern, that Canadian wheat will be henceforth admitted to the States duty free; the importer giving a bond for the payment of duties hereafter in case the reciprocity treaty fails of final ratification by the high contracting parties.—There is little probability of such a contingency occurring, as the treaty is already endorsed by the United States, Great Britain, and several of the Provinces.

Many of our millers and others have been purchasing wheat in Canada in anticipation of this measure, and the recent rise in the article, added to the difference made by the remission of duty, will make these purchases a splendid speculation.

INDICTMENT FOR MANSLAUGHTER.—A Canadian Grand Jury has found an indictment for manslaughter against D. W. TWITCHELL, the Conductor, and J. KITTLEWELL, the Engineer of the locomotive St. Lawrence, employed at the gravel pit on the Great Western Railroad, they having, by reason of wilful negligence, caused the death of J. P. HODFISH and NATHANIEL OAKES, and about 50 others. In accordance with this presentment, the Lord Chief Justice MACAULAY issued bench warrants for the apprehension of TWITCHELL and KITTLEWELL, and the latter was apprehended and lodged in jail, bail for his re-appearance being refused.

The Jury also censured the Great Western Railway Company for not having a watchman in their employment stationed at the gravel siding, instead of one employed by the gravel contractor.

BRITISH WAR STEAMERS.—The screw steam navy of Great Britain now comprises 107 ships, ranging from 131 guns and a crew of 700 men, to 3 guns and a crew of 40 men. The Duke of Wellington is the maximum, and the Teazer is the minimum limit, both in guns and crew.—Between these limits there is one steam-ship of 121 guns, 2 of 120, 2 of 100, 6 of 91, 10 of 90, and the remainder range at various figures below. These ships are together armed with the enormous number of 4,010 guns, and manned by crews amounting in the aggregate to nearly 30,000 men.

In contrast with this enormous steam marine of Great Britain, it may be proper to state that the United States have two screw steam-ships in commission, the Princeton and San Jacinto, and seven frigates building—total 9.

THANKSGIVING.—The Governor of the State of New Jersey has appointed the 23d inst., and the Governors of Connecticut, Rhode Island, Michigan, Illinois and North Carolina, the 30th, to be observed as a day of thanksgiving and praise by the people of their States respectively. These, with the States noticed last week, amount to fifteen which have made the appointment for the annual religious anniversary, all but four of which named the 30th inst. as the day.

P. S. Gov. SEYMOUR, of this State, has also appointed Thursday, the 30th inst.

WESTERN MONEY.—Bills on nearly all Banks in the Western States, except Ohio, are unsalable, and of course *unusable*, in this city.—Bankers and brokers refuse to purchase, except at very high rates of discount, Indiana, Michigan, Illinois and Kentucky money. Western agents and friends of the RURAL will please note this fact, and remit Eastern money, (or drafts on New York or Buffalo, charging us the exchange,)—at least until there is a decided improvement in the market for bills on Banks in the States above named.

SENTENCE OF DR. GRAHAM.—DR. GRAHAM, the homicide of Col. LOMAX, was last week sentenced to a seven years term in State prison.—The judge, in view of the aggravated circumstances of the case, gave the prisoner the extreme limit allowed by the statute.

Direful Shipwrecks.

THE steamer Yankee Blade, from San Francisco to Panama went ashore on her last trip down, and became a total wreck. There were over 800 passengers on board, out of whom it now appears probable at least 150 perished.—The ship was deserted by all her officers except the third mate, and while lying on the rocks a portion of the crew and ruffianly desk passengers armed themselves and engaged in a work of pillage and rout that ought to have shamed a legion of fiends. Some of the passengers, it is alleged, were murdered during the time the ship lay at the mercy of the waves. The survivors were finally taken off the wreck next day by the steamer Goliah, which landed them at San Diego.

A telegraph despatch from New York, dated Nov. 12th, says:

The emigrant ship "New Era," belonging to Bath, Me., from Bremen, with 360 passengers, went ashore last night in a dense fog off Deal, near the Jersey shore, and will probably be a total wreck.

Later despatches say that should the heavy sea continue during the night, it is scarcely possible that more than a very few of the passengers now on board and holding on to the rigging, can be saved, and it is not at all improbable that every soul will be washed overboard before daylight. The ship lays broadside to the sea, which runs mountains high, and renders it impossible for the tug boats to render any assistance. The sea is breaking over the wreck, and before dark we could see every available space in the rigging filled with probably some 200 persons. No less, probably, than 75 have already been washed overboard; and from present indications, a great many more will be hurled into the sea, before any efficient assistance can be rendered.

Diplomatic Tempest.

RUMORS came some time since from Europe, in substance that Mr. SOULE, the United States Minister to the Court of Madrid, would be denied permission to pass through France on his return to Spain, from London, whither he had gone on a visit. It now appears that he was actually stopped by the police at Calais, and sent back to England by the return steamer.—Great indignation is manifested by the members of the legation and other Americans in London, at the alleged wanton insult offered to the United States in the person of one of her Ministers. The intention was to send Mr. SICKLES, of the American legation at London, over to France to inquire into the affair, but for some cause the matter was delayed. Further developments will be looked for with interest, and until they appear it will be useless to speculate upon the consequences of such an unusual lack of courtesy on the part of the French authorities.

"LIFE ILLUSTRATED—a Journal of Entertainment, Improvement and Progress," is the title of a new and beautiful folio weekly, published by FOWLERS & WELLS, New York, at $2 per annum. The number before us indicates talent and ability, which, with the reputation of the publishers, give the enterprise the prestige of success.

— In perusing the *Life*, we find, among other sensible and spicy paragraphs, one which so happily expresses our own sentiments, and general practice, that we subjoin it for the benefit of all RURAL readers interested. Contributors and correspondents are too apt to judge from wrong impressions or premises; were they in the position of Editors, what they often condemn would be approved and practiced by themselves. But to the paragraph—thus:

Have the goodness to bear in mind, ladies and gentlemen, that a communication may be deferred or declined from considerations totally irrespective of its merit as a composition. It may be too long. It may come too late. We may have another article on the same subject already in type. Our space may be pre-engaged. The subject may be unsuitable or untimely, or it may be less suitable and less timely than that of articles previously received. Remember that the Editor *alone* is in a position to judge of the comparative claims of the different articles to insertion. We are bound to consider the interest and pleasure of our subscribers before any thing else, and we shall, in all cases, do so. A writer naturally places a certain value upon his own productions, and is naturally disappointed when an article upon which he has set his heart, does not appear. But we rely upon the good sense of our contributors, and believe that the considerations to which we have alluded will meet with an unfeigned response from all.

INDEBTEDNESS OF CITIES.—The somewhat alarming tendency of municipal corporations to run into debt, is notorious, and ought to be held in check by the wholesome restraints of a sound public opinion. Of the enormous indebtedness of New York, Philadelphia, and other large cities, most people are fully aware; but it takes western cities, predicating their ability to pay upon the rapid increase of population and individual wealth, to go into the market for credit most extensively, thus:—According to the annual report of the Comptroller of the city of St. Louis, the amount of the indebtedness is $35,553,096, including subscriptions to railroads.—The amount of real estate assessed in the various wards of the city is put down at $41,104,921.13. Amount of merchandise for taxation, $10,148,937.77, being no increase over last year of 3,081,885.93. The amount of revenue from all these sources collected during the year, is estimated at $651,090, which is an increase over last year's return of $40,000.

"THE OLD FOLKS" will give a Concert at Corinthian Hall, in this city, on Friday evening, Nov. 24th, under the direction of Mr. DWIGHT. A good time is anticipated.

News Paragraphs.

☞ The commissioners of emigration in New York have discovered that gross frauds have been committed upon them by some of the postmasters, in the "rural districts." Scores of foreign paupers in the interior of the State, who were registered as chargeable on the Emigration fund, were found on investigation to be dead or missing. In one county, sixty paupers were charged who could not be accounted for.

☞ William Grisby, a successful pedestrian, announces that he will undertake on the Union Course, L. I., the extraordinary feat of walking one mile, draw a sulkey containing a boy 16 years of age two miles, go backwards one mile, and pick up stone 50 yards apart, and place them one by one in a basket, all to be done within one hour. A bet of $1,000 has been staked on the result.

☞ A writer in the New York Journal of Commerce says that when the accident to the Arctic was discovered, had the boilers been blown clear of steam, and filled with air, which could easily here been done, the tank would have sustained the entire fabric in which they rested. The builders of the engine confirm this opinion.

☞ It is said that before the expedition started for Sevastopol, the Sultan made a present to the British sailors; and it was one certainly more consonant with the established sentiments of the true British tar than with those which are supposed to be hereditary in the descendants of the Caliphs—he gave them five hogsheads of rum.

☞ The Boston Railroad Company, it is said, are about to introduce coke, from Cumberland coal, as fuel for their engines, in consequence of the high and increasing price of wood. Some of them are endeavoring to use anthracite but the experiments made show that their engines have to be specially adapted to that kind of fuel.

☞ The Legislature of Vermont, now in session, has passed a law to punish fraudulent issue and transfer of stock, making such issue a felony, punishable by fine not exceeding $1,000, and imprisonment in the State Prison for a term not less than one year nor more than ten.

☞ Irish and Scotch laces to the value of £2,500,000 sterling, or over a million dollars, are said to be sent every year to the United States, where most of them are sold as "French," "Valenciennes," "Marseilles," "Brussels," &c., which it is the fashion to believe are better than those made in Great Britain.

☞ The Austin State Gazette of the 30th ultimo says, that the Governor of Texas has refused to receive the stock offered by Messrs. Walker and King as the deposits to secure the Pacific Railroad Contract—the project is therefore considered a failure.

☞ In the U. States District Court at Columbus, Ohio, R. A. Shane, a Sandusky lawyer, was convicted under the fugitive slave law of 1850, of aiding in the escape of three slaves.—Judgment was awarded for the penalty of $3,000, $1,000 in each case, with costs.

☞ Rev. Mr. Morton, an English missionary, now laboring at Loo Choo, acknowledges the receipt of $275, a donation to his mission, from officers of the American Expedition to Japan.

☞ A duel was fought fourteen miles from Columbia, S. C., on Thursday week, between Peter Gaffney and Dr. Ray. The former was killed at the second fire; the latter was not injured.

☞ Isaac Toissaint L'Ouverture, son of the Haytien negro General of that name, died lately at Bordeaux, France, where he was in receipt of a liberal pension from the French government.

☞ Joanna Rentz advertises in one of the Albany papers that if her runaway husband does not return within three days from date, she shall consider herself divorced and marry again.

☞ Mary Howit is engaged in writing a popular History of America, intended to make the reading class of English artizans better acquainted with the history of the United States than they have heretofore been.

☞ Washington papers mention the recent death of Col. William Hunter, a gentleman who for the last quarter of a century had been a clerk in the office of the Fourth Auditor of the Treasury.

☞ The Philadelphia Ledger gives a list of salaries paid annually under the new consolidated government of Philadelphia, amounting to $644,250. Of this aggregate $179,100 goes to the police.

☞ McFarlane, a tight rope performer at Castle Garden, New York, performing the daring feat of ascending on a tight wire from the ground to the wall, a distance of 130 yards, and come down again successfully.

☞ Two women have settled in Nevada, California, for the purpose of telling fortunes.—Locations of good mining claims are described for $10 cash, and $250 payable out of the first proceeds of the claim.

☞ The Catholic Church at Oxford, Chenango county, was recently broken into, and the Silver Pixis, or vessel cased with gold for containing the blessed Sacrament, stolen, and other damage committed.

☞ The telegraph says that Mr. Hall, of Missouri, declines the Governorship of Nebraska, and the vacancy will not be filled perhaps for some months. In the meantime, the Secretary (Cumming) will be the acting Governor.

☞ Arrism, the villain who murdered Allison and wife at Cincinnati, some time since, by an infernal machine, has been arrested at Muscatine, Iowa, and taken back to Cincinnati.

☞ In the month of September, upward of fourteen thousand emigrants arrived at New York—one thousand more than in the same month last year.

☞ Mr. Finney, a dentist, late of Alexandria, Egypt, is reported to have found a stuffed tooth in a mummy, and several teeth in other mummies which bore marks of filing.

☞ The Panama railway is completed to within eleven miles of Panama, and the cars run that distance; the rest of the distance is performed in three hours on mules.

☞ Sir David Brewster has in preparation a work of great interest, namely, "The Life, Writings and discoveries of Sir Isaac Newton."

☞ During the past twelve months, more than 1,000 American vessels, including those on the lakes and rivers, have been lost.

☞ It is understood in Tampa, Florida, that the Federal authorities are about commencing the construction of roads into the Indian country.

News Brevities.

—— Greytown is being rebuilt rapidly.

—— The Mormon population of Utah is 30,000.

—— In Denmark entire villages have been converted to the Mormon faith.

—— There are thirty-two States and nine Territories in the United States.

—— An Agricultural College is to be established in Ohio, to be located at Oberlin.

—— Grain constitutes the bulk of the export trade from the Crimean Harbors.

—— The force of workmen at the Washington Navy Yard is almost nine hundred men.

—— A field of sweet potatoes in Scott county, Iowa, yields 700 bushels to the acre!

—— The bonded goods in the Crystal Palace, at New York, are being sold at auction.

—— The Wisconsin says that sportsmen are shooting quails in the streets of Milwaukee.

—— The ports of the Sandwich Islands have been made free to the commerce of all Nations.

—— The Legislative Assembly of Canada has adopted the Maine Law by a majority of 95 to 5.

—— The Washington Monument has now attained a height of one hundred and sixty-six feet.

—— A tunnel is being constructed in Switzerland, which will be, when completed, 8,300 feet long.

—— A recent census of Michigan shows a population of almost 520,000, being a gain of 110,000 in four years.

—— Sir Edward Head, the new Gov. General, arrived at Quebec, Nov. 9th. Lord Elgin will leave in 3 or 4 days.

—— Ex-mayor Maury, of Washington, was lately presented with a service of plate valued at $1,000.

—— A wire suspension bridge across the Monongahela river, at Morgantown, Va., is nearly completed.

—— The Baptist denomination are going to publish a paper in Knoxville, Tenn., to be called the Baptist Watchman.

—— Milwaukie drives a pretty large trade in beer. Her exports for the present season have been 10,238 lbs.

—— The wrecks on the coasts and in the seas of the British Empire, during 1853, were 832, against 1115 in 1852.

—— Mrs. A. M. Hinckly, has been held to bail at New Orleans, on charge of cruel treatment to her slaves.

—— The Yankee Packet ship, James Baines, recently ran from Boston to Liverpool in 12 days! The quickest time on record.

—— Mrs. Catherine Cypress died of fright at Fulton, Ohio, on the night of the 25th ult., induced by a gang of negroes attacking her house.

—— The large Passenger Station of the Albany and Boston Railroad at Pittsfield, Mass., was destroyed by fire a few days since.

—— The whipping post is still in use in Covington, Kentucky. Lawrence Hunt was publicly whipped in that place last week for stealing.

—— The Supreme Court of Holland has just decided a case begun in 1420, respecting the boundary between two communes.

—— Contrary to the opinion generally received Finland is reported as Russian—not part of love to Russian rule, but out of hatred to Sweden.

—— The new school Presbyterians have resolved to establish a publishing house at Philadelphia. A site and buildings have been purchased for $15,000.

—— A young man, named Van Olinden, has lately been sent to jail in Detroit, for the crime of throwing stones through the car windows on the Central road.

—— The English Society for the Propagation of the Gospel has it in contemplation to open a fund for maintaining an additional number of clergymen at the seat of war.

—— The Mormon Temple which is being erected at Salt Lake City is described as being a very magnificent structure, covering an area of 21,860 square feet.

—— The sales of the public lands this year will exceed 6,000,000 acres; a larger quantity than has been sold in any one year for fifteen or eighteen years.

—— The mining industry of Chili is in a high state of development. The yield of silver for 1852, is estimated at a sum equal to £2,400,000 sterling.

—— New Clubs under the organization of Constitutionalists, have been formed in Philadelphia, designed to be a counterpoise to the Know Nothings.

—— A statue of Beethoven, for the Boston Music Hall, has just been cast in bronze, at Munich. It is said to meet the approbation of the best European judges of statuary.

—— There are no less than six thousand pianos manufactured in Boston annually, and they are sold at prices varying from $225 to $1,500 each.

—— A sheaf of wheat was suspended from the altar of the church in the little village of Empingham, England, on the occasion of the recent Thanksgiving for the bountiful harvest.

—— A large edition of the Italian New Testament, of at least 30,500 copies is soon to be published in Italy, under the superintendence of Dr. G. Achilla.

—— The Austrians are building forts around Cracow; one of them is called Fort Kuscinsko! Can the Austrians pronounce that name without a blush?

—— Cholera is fast disappearing from most of the West Indin Colonies. The accounts of the coming sugar crops are generally good, but a great scarcity of labor prevails.

—— The Richmond Mirror of Oct. 27, says: Our streets for two or three weeks past have been thronged with emigrants, going, we presume, to Kansas and Nebraska territories.

—— John Collins, a minor, was recently sent to the Boston house of correction for six months as a common drunkard. He has already spent six years of his life in that institution.

—— The Albany Register suggests that the story of the oyster disease was got up by the politicians, as a matter of political economy to save themselves the expense of suppers.

—— At present there are said to be seven hundred and fifty paper-mills in the United States, computed to make nearly three hundred millions of pounds of paper annually.

—— An important Railroad has just been opened in Ohio—that leading from Wheeling to Columbus. This completes the connection between Cincinnati and Baltimore.

Western Correspondence.—No. II.

Advice of the People—Religious Sentiments—Temperance—Common Schools, &c.

Messrs. Eds.:—To the mind of an eastern man, there is one truth strikingly apparent in all the western towns, i. e., there is far more life, activity and energy, than in eastern towns of the same size. Emphatically so is it with Ionia, Michigan, the place from which your correspondent hails. The ruling men are those in the employ of the government—men of learning and intelligence—who have earned for themselves reputation and wealth, and who have given character to the whole mass of the people. The religious spirit is dead in the hearts of some—flickering in that of others, and "*all alive*" in that of a few. Alas! why is there not, in some spot on the green earth, one noble exception to this! Few are the idlers and loungers about the streets and tavern doors, hence idleness (that vice which, said the Irish school-master, "clothes the body with nakedness,") is seldom seen.—Lack of business there is not, and labor is amply repaid. Thus peace and harmony generally prevail, for when each finds at home sufficient business to occupy his attention, he will feel little inclined to meddle with the affairs of his neighbor. Fine opportunities for entering into business of various kinds, are open to thoroughly enterprising men, though their capital be small, and doubtless in a few years they would realize a handsome income.

The country around Ionia is peculiarly healthful; and in the aggregate there has been but little sickness and few deaths during the summer. There were a few cases of cholera, but none proving fatal. The people are friendly to Common Schools, and a large, fine building has been erected in the centre of the village, capable of containing upwards of two hundred scholars. They are furnished with teachers of the best qualifications, and the school is now in a remarkably flourishing condition. Much might here be said of the ample provision Michigan has made for the education of her sons and daughters, but I fear I shall exceed proper limits. It commends itself to every true friend of learning. The Ottawa and Grand River Valley Railroad is laid out through this place, which, when completed, will render the communication with the eastern marts, much easier and far less expensive.

I must not omit to say there is quite a creditable little sheet published and issued on Friday of each week, yclept the Ionia Gazelle. If I mistake not it is one of your exchanges. The resources of Ionia are as inexhaustible as the boundless forests around—surrounded for many miles with a rich agricultural district, and peopled with active, enterprising citizens who would do honor to any land—a prosperous and successful future may be prophecied for her.—Were the west to be my home, I could well consent to become one of her citizens. And now, summer with her green forests, gay song-birds, and sunny skies, has gone to swell the countless host of long-forgotten ones, and autumn's mournful wail falls heavily on the ear. E'en now the departing year begins to show signs of grief, as the seared and yellow leaves, snapped from their decayed stems, flutter and fall to the earth, already rich with these dead trophies.—The harvest is passed, and the golden corn is gathered in. O! how big with instruction is every change around us. May life's fleeting hours be so improved by us, that when *its* autumn shall have come upon us, "like shocks of corn fully ripe," we may be gathered into the upper garners.

S. A. E.

Ionia, Mich., Nov., 1854.

Foreign Intelligence.

Arrival of the America.

HALIFAX, Nov. 9.

The London Times says: "We are informed that Mr. Soule, the American Minister at Madrid, was on Tuesday, the 25th, refused permission to pass through France on his return from England to Spain."

The London Morning Post, announcing semi-officially the acquisition of Samana, says:—"It amounts, virtually, if not absolutely, to the annexation of San Domingo. The acquisition, by the United States, of so important a position in the West Indies, a position threatening on either hand the Spanish islands of Cuba and Porto Rico, and so directly affecting the British West Indian possessions, cannot be received with indifference."

Sevastopol is not taken. The latest advices show that 20 days elapsed between the departure of the besieging armies from Bulakava, and then opened a fire upon Sevastopol. Both the French and English had their batteries open on the 15th. On the 17th, fire was opened on the place from land and sea. The bombardment continued till night. The Russians lost 500 killed and wounded. Among the former, Admiral Korniloff.

The Russian fortifications suffered very little. On the next day, the 18th, the bombardment was resumed from the allied batteries only.—When the mail left Constantinople on the 16th, five steamers had arrived at Bulakava, with men to unite in repelling the great sortie of 200,000 strong.

Gens. Raglan and Canrobert had formally summoned Sevastopol and required women and children and sick to be sent away, and flags to be hoisted upon the hospitals.

So far as is known the Russian army is concentrating on the Upper Belbi, and already numbers 45,000. The allied army is divided into a siege army and army of observation.

On the 5th and 17th the garrison of Sevastopol made sorties and destroyed some small works. On the evening of the 5th a convoy of 40,000 Russians succeeded in entering Sevastopol. The allies now number 110,000 men and additional French were ready to embark from Marseilles on the 21st, and 8,000 Turks from Varna.

Letters of the 12th say that the allies have 300 guns, battery, and after a few days fire will attempt to storm the garrison, which is estimated at 40,000 men. Altogether the prospect of the speedy fall of Sevastopol is not so favorable to the allies.

Admiral Makinoff who commanded at Sinope is commandant of Sevastopol. "He has published an address saying that he will defend it to the last, and any is welcome to shoot him if he don't."!!!

Affairs look black between Russia and Austria. A great council of war was held at Vienna. The Emperor presided, and it is reported that Austria summons Russia to withdraw from the frontier of Silicia.

The whole Austrian army was to be put on a war footing on the 26th. The garrison of Vienna has orders to be ready for marching at 48 hours notice.

Russia in the meantime continues to menace Austria.

The Czar has gone to Warsaw, and his forces are concentrating on the Austrian frontier. Little doubt is entertained at Vienna, that ere long there will be actual hostilities.

GREAT BRITAIN.—The British fleet is to leave the Baltic about the 10th of November, returning in squadrons, to Portsmouth, Sheerness, Plymouth, and Cork. Five floating batteries and 20 gun boats, drawing 4 feet of water each, are building in England for the spring operations.

Another Polar Expedition is to be sent next spring to bring home the remains of Sir John Franklin's party. Dr. Rae will have the command.

A galvanic apparatus was being constructed at Newcastle-on-Tyne, to blow up the ships sunk off Sevastopol.

FRANCE.—The Emperor has written a letter of condolence to Madame St. Arnaud, and bestows a pension of 20,000 francs, as a national recompense. The whole camp of the south is to embark for the south if required.

SPAIN.—M. Soule's return to Madrid caused quite an excitement, and a clamor was being made to induce the Spanish government to solicit his redrawal.

AUSTRIA.—Austria has just concluded an immense financial operation, by which she has transferred to a company of capitalists all railroads constructed and worked by the government in Hungary and Bohemia. The company pays 200,000,000 francs, on which the government guaranties 5 per cent.

CHINA.—The overland mail has been telegraphed, with Canton dates of Sept 9th. Canton was still besieged, and the distress of the besieged was great. The insurgents yet hold Shanghai.

Arrival of the Atlantic and St. Louis.

The Havre steamer, St. Louis arrived at New York on the 11th, and the Liverpool steamer Atlantic on the 12th, with four days later news from Europe. There is nothing in their despatches to vary essentially the news of the America. No new developments have been made on the war question, and the seige of Sevastopol continues, but has not yet been stormed.

LIVERPOOL MARKETS.—Richardson, Spencer & Co., report Liverpool cotton steady, without improvement in price.

Breadstuffs very quiet. Flour 2s lower.—Philadelphia and Baltimore, 40alls.

In Wheat nothing doing. White, 12a12s 6d. Indian Corn 1a2s lower—quoted 42s.

Beef and Pork unchanged. Bacon steady—retail 35a37s 6d. Lard very quiet—35s 6da5 6s.

California News.

Arrival of the North Star.

The U. S. mail steamship North Star arrived at New York, Nov. 9th, from Aspinwall, Nov. 1st, with the California mails to Oct. 16, and nearly $1,800,000 in specie. She connected with the steamer Golden Gate, which was detained at San Francisco until 4 P. M., to enable merchants to answer their letters by that vessel. She reached Panama on the evening of the 28th.

The steamship Yankee Blade, which left San Francisco on the 30th Sept., for Panama, was wrecked on the following day. She had on board 800 passengers, beside the crew and firemen, when she struck on a reef of rocks off Point Arquella, 15 miles above Point Conception. About fifteen lives, and all the specie on board, were lost. The ship was a total wreck, and in a day or two was broken up by the sea and washed to pieces. A fog hung upon the coast, and the Captain supposed the ship to be 20 miles from land when she struck. Some terrible scenes of pillage and murder took place on board the vessel after she struck, and before the passengers were rescued by the steamer Goliah, plying between San Francisco and San Diego.

The great topic of discussion in the California papers seems to be the Schuylerizing of Henry Meigs, and the manner of the sudden departure of himself and brother.

The Chronicle says the following may be taken as a moderate approximation of his liabilities. The amount of failure in his proper business is $800,000; Comptroller's Warrants forged $500,000; forged, or over issued stock on the California lumber company, of which concern he was President, $250,000; forgeries on different firms $50,000. Total, $1,600,000. The forged warrants and stock had been hypothecated for advances. It is supposed that Meigs may have received upon them nearly $400,000, upwards of half of which sum it is estimated he has taken away with him.

John G. Meigs, a brother of Henry's, and who was recently elected under reform of the Know Nothing auspices, disappeared with the Arch Swindler. They left secretly on the 3d inst., on the Bark America, which had been bought, provisioned and armed, for the occasion, and was cleared for some port in the Pacific.

SAN FRANCISCO MARKET, Oct. 13.—The first week of the fortnight was marked with unusual activity. During the last week business less active.

An early revival of trade is anticipated.

Flour—No imports, and nothing of interest to note.

The only sale of moment was of Garigo, at $12, since which this description has advanced 25 cents per barrel. Mess Pork, $18. Clear, $21@22. Mess Beef, $18@ 18,50.

Marriages.

In Charlotte, on the 8th inst., by the Rev. J. B. Shaw, H. D., Mr C. S. BENJAMIN, of this city, and Miss ELMIRA NEWCOMB of the former place.

In East Hearietta, Nov. 1st, by Rev. S. W. Streeter Mr. ANDREW S. WADSWORTH, of New York city, and Miss CARRIE L., daughter of Elihu Kirby, Esq., of Hearietta.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, Nov 13, 1854

THE order of prices has reversed during the week; Wheat having receded from extreme quotations, and the coarser grains having gone up. Flour sells to-day at $10, and Wheat at $2,20. Corn is five cents higher, being quoted at 80 cents; Oats at 43c; Buckwheat $1, and Barley at $1,12½ for first quality).

Butter more plenty and lower, bringing 16 to 18 cents.

Beef and Pork begin to come in freely, the former bringing $4, and the latter $4 50 to $5.

There is a good deal of pressure in the money market, and Western Banks, as well as business firms, are failing frequently. Indiana money especially is decidedly stuff to handle, and among the recent failures outside of that State, may be reckoned the Canal Bank of Cleveland, the Exchange Bank of Buffalo, the Farmers' Bank of Chicago, the Woodbury Bank of Connecticut, and the Farmers' Joint Stock Bank of Toronto.

The North Star, from California, brings in $1,8 0,000, a portion of which, or its equivalent, has gone abroad during the week.

NEW YORK MARKET—Nov. 13

FLOUR—With the exception of moderate export demand for good common State flour market dull and holders can only realize by accepting lower prices. Buyers for the eastern and local trade hold off, and are only taking sufficient to supply their most pressing wants. Receipts for common grades are increasing; this, added to the stringent state of the money market, induces many parties to manifest a disposition to accept lower prices. Sales at $7,75@8 for Interior State, including parcels that have been exposed to the storm, at the inside prices; $8,06½@8 25 for common to straight and favorite State; small lots only at latter figures; $8,44@8,75 for common to good Ohio, Michigan and Wis; $8,75@9,12½ extra Mich; $10,37½@11,12½ extra Genesee. Canadian dull; small sales reported at $9,69 duty paid.

GRAIN—Wheat market about 1cn per cent. per bushel lower. Receipts are increasing, and the state of the money market compels holders to realize at the decline. Millers do not seem very anxious to purchase, under this impression that, with increased receipts, prices must go still lower. Sales fair white Canadian at $1,95 in bond; good white Southern at same figure. Both parcels taken for export. Rye in good demand at $1,20@32. Barley steady with fair demand; sales good two-rowed at $1,37½. Corn market opened heavy, fully 3c lower, but afterwards a good export inquiry sprang up and closed about 1c lower than figures obtained; sales at prices ranging from 87 to 90c for western mixed, closing with a fair demand at about 87c for good sound shipping parcels. Oats dull at 62@66c for State and western.

PROVISIONS—Pork a shade firmer. Fair demand for home use, and some export inquiry. Supply large, but less disposition to press sales. Sales $12,37½@25 mess, closing at latter price; $11@12½ sour and rusty mess; $11,25@37½ prime. Lard firm with good export inquiry; sales at 10@10¾ for ordinary to prime obl. and 10¾@11 for new. Butter, steady moderate purchases at 12½@16c this, 17@22 for State. Cheese in fair request, part for export, 9¾@10¾ Ohio, 10@11c State.

ALBANY MARKET—Nov. 13

FLOUR—The business doing is quite limited, and the news by the steamer has tended to check sales. The demand is mainly of a retail character, and confined to the immediate wants of the trade. Sales at $8,62@9,25 for common to good; $9,26@10,25 for good to fancy Genesee; $9,50@10,50 for fancy to extra Ohio and Michigan; $10,26@$11 for extra Genesee. Corn meal is firm at $1,75@1,81 per 100lbs.

GRAIN—Wheat is in good supply and only in moderate milling demand. Mediterranean was held at $2, with buyers at $1,95. Corn is very quiet, and generally held above the views of buyers. The demand for Barley is moderate, but steady at former prices. Sales of two-rowed at $1,26 for a cargo, and $1,37½ for a parcel, and four-rowed at $1,37½. Oats—the supply is fair but not large, and holders were firm at 56@58 for State, and 55c for good Chicago.

NEW YORK CATTLE MARKET—Nov 6.

AT Washington Drove Yard—Offered to-day 2,654 Beef Cattle; during the week 2,865. Prices—Beeves range from 7½ to 10c per lb. Cows and Calves, $30 to $65.—Veal Calves, $4 to 6. Swine, corn fed, $1,06@4,50. Sheep (on foot) from $2,00 to 6. Lambs, $2,00 to 5.

At Browning's—At market, 652 Beef Cattle, 31 Cows and Calves, 70 Veals, 4,866 Sheep and Lambs. Prices—$7,-50@9,75 per 100 lbs. for Beeves; Cows and Calves range at from $40 to $55. Veals sold at from 4½@8½c per lb. Sheep range at from $2,12 to $6,50. Lambs, $2,00 to $4,50.

At Chamberlain's—At market 598 Beeves, 123 Cows and Calves, 108 Veal Calves, 8,358 Sheep and Lambs.

Prices of Beef ranged at from $7 00 to $9,00 per 100 lbs. Cows and Calves at from $20 to $50. Veal at 5@6½c per lb. Sheep $2@6. Lambs $1.75@4,50.

At O'Brien's—Sales of Beeves at $7@9,50 per 100 lbs. Cows and Calves at from $25 to $40. Veal 5@6½c.

BUFFALO MARKET—Nov. 13

FLOUR—Dealers are waiting steamer's news. We find only sales of 200 barrels good Ohio and Indiana at $8,50.

GRAIN—In Wheat and Corn there is nothing doing.—Oats in some request, and prices are without change; sales at 42c.

CHICAGO CATTLE MARKET.—Nov. 8.

The Cattle market has been quite active during the present week, with no change from prices of the week previous.

Sales at West Brighton—Beef Cattle—48 from Cook co., at $1; 10 from Champaign co., at 3,20; 20 from Kendall co., at 2,75; 94 from Will co., 3,10, net; 15 from Moultrie co., at 2,75; 23 from Moultrie co., at 2,50; 142 from Moultrie co., at 3,50@6, nett. Sheep—100 head from Du Page co., at $3; 210 from Shelby co., at 3. Hogs—48 head from Ogle co., at $4, net; 150 from Cook co., at 3,60, net; 120 from Kane co., at 3,50; 44 from Cook co., at 2,88. Horses—The horse market has been quite animated this week.—At Eddy's market, 50 to 100 have been sold from $80 to $400: average price $100.

CAMBRIDGE CATTLE MARKET.—Nov. 8.

AT market 2,186 Cattle—about 2,000 Beeves, and 816 Stores; consisting of working oxen, cows and calves, yearlings, two and three years old.

Prices—Market Beef—Extra $8,00 per cwt.; 1st quality, $7,50; 2d do, $7@7,25; 3d, do, $6@6,50; ordinary, $4,00@5. Hides, ₹ cwt. $6,50@6; Tallow $6@8,25; Pelts 42@76c. Calf Skins, 11c ₹ lb.

BARRELLING CATTLE—$6,25@7,25.

VEAL CALVES—$6, 7, 8@9.

STORES—Working Oxen—$114, 134, 140@186.

COWS AND CALVES—$21 to $42@72. Yearlings, $9 to $10@12. Two years old—$14 to $22@29. Three years old, $28 to $10@49.

SHEEP AND LAMBS—6,782 at market. Prices—Extra—$4,50 to $7@11. By lot—$2 to $3,75@4.

Swine—All large hogs, wholesale, at 4½@4¾c per lb.

BRIGHTON CATTLE MARKET—Nov. 9.

AT market 2,100 Beef Cattle, 1,100 Stores, 6,200 Sheep and 1,600 Swine.

PRICES—Beef Cattle—Extra, $8 00@$8,50; first quality, $7,50@8,00; 2d, $6,75@7,25 3d, $5 50@6,50.

Working Oxen—Sales $78 to $150@155.

Cows and Calves—Sales $24 to $42@45.

Stores—Yearlings $7@10; two year old $15@23; three year old $30@42.

Sheep and Lambs—Small lots $2 to $2 60@3.

Swine—Still fat hogs, 4½@4¾c; corn fed, 5@5¾c; shoats to peddle, 4¾@4¾; at retail, 5 to 6¾c.

ROCHESTER EYE AND EAR INFIRMARY.

DR. WALKER, Oculist and Aurist, (late of the Royal Ophthalmic Hospital London, England,) continues to attend exclusively to the treatment of Deafness and all diseases of the EYE and EAR. Constant and extensive practice, enables Dr. W. to treat these cases with success seldom attained. [254-tf]

☞ Dr. WALKER may be consulted daily, and testimonials obtained, at his office, 82 State St., Rochester, N. Y.

Advertisements.

ADVERTISEMENTS inserted in the RURAL NEW-YORKER at 15 cents a line, each insertion,—*to be paid in advance.*—Brief advertisements preferred, and we do not wish to give any one more than four successive insertions. Our space is limited, and we wish to accommodate and benefit as many applicants as possible,—at the same time interesting our readers by presenting something new, weekly.

253-tf S. P. CHITTENDEN,
Mount Pleasant Farm, Clockville, Madison Co., N. Y.

CARLISLE SEMINARY,

[MALE AND FEMALE.]

Rev. JAMES DOUGLASS, A. M. Principal,

Assisted by a large corps of able and experienced Teachers, filling every department of instruction.

This Institution is located at Carlisle, Schoharie Co., N. Y., 30 miles west from Albany, and 12 miles south of Canajoharie. The buildings are new and of sufficient capacity to accommodate over 200 boarders. They are situated in the midst of a beautiful grove of some ten acres of ground belonging to the Seminary.

Carlisle is a pleasant, healthy and retired village, and contains no hotels, saloons or groceries where intoxicating liquors are sold.

INTERNAL ARRANGEMENTS.

There are six large recitation rooms, six music rooms, a commodious chapel, rooms for literary societies, a reading room, library, a large and convenient room for Oil Painting with sky and side lights, bath rooms in connection with each department; and five flights of stairs all connecting with outside doors and accessible from any part of the building, thus affording ample opportunities of escape in case of fire. The whole is warmed by furnaces in the basement, thus obviating the danger and inconvenience of having stoves in the rooms—but at the same time keep an equal temperature throughout the halls and rooms. Students are never exposed to draughts of cold air, as they are not required to go out of the building in passing to the recitation rooms, chapel or dining hall. The rooms of the students vary in size from 10 by 11 feet to 16 by 16 feet, and are furnished with a movable register in the floor, and also with a ventilator, by which means each student may graduate the temperature of his own room at pleasure. In addition to the above conveniences, the Institution employs servants to carry water to and from the several halls, trim the lamps and do the extra cleaning of the Students' rooms.

BOARD.

We intend the board shall be decidedly superior to that which is allotted in other boarding schools, thus removing the reproach too often, in many cases too justly connected with them.

BOARD OF INSTRUCTION.

In the selection of Teachers, the Trustees have spared neither pains nor expense. Every department of Instruction is filled by Teachers of superior qualifications—experience and success in their profession. Students completing a prescribed graduating course will receive Diplomas.

DISCIPLINE.

The students of both departments are under the constant supervision of the Principal, Preceptress and Teachers—sit at the same table with them, are accompanied by them to church and on their excursions, and are instructed concerning the social proprieties as well as the duties and obligations of life. No intercourse whatever is permitted between the two departments except in the public parlor with the permission of the Principal and Preceptress. No gentleman is allowed to visit a lady in her private room.

EXPENSES.

Board, with washing, fuel, and room, furnished with good mattress bed and bedding, table, chairs and stools, wash-stand, washbowl and spittoon, water-pitcher, tumblers, window curtains, clothes-screen, pail, lights, consisting of lamps already trimmed, &c., per week..... $2,00

TUITION GREATLY REDUCED.

Tuition for all branches, including the Higher Mathematics, Algebra, Geometry, Surveying and Civil Engineering, Ancient and Modern Languages, per quarter..... $5,00

EXTRAS.

Lessons on Piano Organ or Melodeon, per quarter,	8,00
Use of Instrument,	2,00
Lessons on Guitar,	6,00
Use of Instrument,	2,00
Lessons on Violin,	5,00
Oil Painting,	6,00
Drawing and Painting (in water colors) each...	3,00
Crayoning, Monochromatic and Grecian Painting,	8,00
Ornamental Needle Work and Worsted Flowers, each,	3,00
Ornamental Leather Work,	3,00
Papier Machie, (materials furnished,)	6,00
Shell Work and Tissue Flowers, each,	5,00
Wax Fruit and Flowers,	4,00
Pastel Painting,	4 00
Vocal Music,	1,50

☞ All bills must be paid in advance at the commencement of each quarter.

TERMS AND VACATIONS.

The academic year is divided into two terms of twenty-two weeks, and each term into two quarters of 11 weeks each. The next quarter commences on the 23d of November—continues 11 weeks, and is succeeded by a vacation of two weeks. The second term commences on the 22d of February, continues 22 weeks, and is succeeded by a vacation of six weeks.

CONVEYANCE FREE.

On the 22d of November, at the commencement of the next quarter, Students will be received at Palatine Bridge or Canajoharie, and carried to Carlisle free of expense.—Students are received at any time during term—new classes being formed as circumstances require, and are charged tuition only from the time of entering.

An express leaves Canajoharie for Carlisle on Tuesday, Thursday and Saturday of each week at 1 o'clock, P. M.—A stage (the Cherry Valley stage) leaves Albany, corner of State street, and Broadway, Museum Buildings, at 7 o'clock A. M on Monday, Wednesday and Friday of each week, arriving at Carlisle in the afternoon of the same day.

S. P. SHIBLEY, Pres't.
Geo. Brown, Sec'y. 252-4t

THE RURAL FOR 1855.

OVER $700 IN CASH PREMIUMS!

Post-Masters, Agents, Subscribers,

And others who wish to benefit themselves, and promote the interests of community, are respectfully invited to note a brief announcement,—one which is, we confidently believe, most worthy their best attention. After bending low in grateful acknowledgment to Post-Masters, their Assistants, Agents and Subscribers, whose exercise of influence has enabled us to render Moore's RURAL NEW YORKER the *first* Journal of its class in Circulation, Influence and Popularity, we desire to communicate, in a few words, the substance of a PRIZE LIST which *far exceeds*, in both *numbers* and *value*, any of its predecessors. Relying upon *acts* rather than *words*, we proceed without circumlocution or palaver, to invite your attention to the following list of splendid CASH

PREMIUMS FOR SUBSCRIBERS:

ONE HUNDRED DOLLARS for the largest list of Yearly Subscribers to the RURAL NEW-YORKER—the payment to be remitted according to our Club terms, previous to the 1st day of February, 1855.

EIGHTY DOLLARS for the next (second) largest list, as above specified.

SEVENTY DOLLARS for the third list.

SIXTY DOLLARS for the fourth list.

FIFTY DOLLARS for the fifth list.

FORTY DOLLARS for the sixth list.

THIRTY DOLLARS for the seventh list.

TWENTY-FIVE DOLLARS for the eighth list.

TWENTY DOLLARS for the ninth list.

TEN DOLLARS in each of the *five* persons sending the 10th, 11th, 12th, 13th, and 14th lists, as above.

FIVE DOLLARS to each of the *five* persons sending the 15th, 16th, 17th, 18th, and 19th lists.

THREE DOLLARS to each of the *six* persons sending the 20th, 21st, 22d, 23d, 24th, and 25th lists.

☞ We also offer the following very liberal list of

CHRISTMAS CASH PREMIUMS.

FIFTY DOLLARS for the largest list of subscribers to the RURAL NEW-YORKER, sent in or mailed according to our terms, on or before the 20th day of December ensuing, (1854.)

THIRTY-FIVE DOLLARS for the next largest list, as above.

TWENTY-FIVE DOLLARS for the next list.

FIFTEEN DOLLARS for the next list.

TEN DOLLARS for the next list.

FIVE DOLLARS for the next list.

☞ Persons competing for Christmas Premiums are not excluded from the February prizes, so that one person may receive *One Hundred and Fifty Dollars, in Cash!*—another *One Hundred and Fifteen Dollars*, &c.

[In order to give Post Masters, Local Agents, &c., a fair and equal chance, travelling agents, post-riders and citizens of Rochester are excluded from competition for any of the above Premiums.]

SPECIFIC PREMIUMS.

In order to REWARD EVERY PERSON who may aid in extending the circulation of the RURAL NEW-YORKER, we offer to such as do not compete for any of the preceding Premiums, the following liberal gratuities for subscribers forwarded previous to the 1st of April, 1855:

THREE DOLLARS, IN BOOKS, or a handsomely bound volume of the RURAL for 1854, for THIRTY subscribers.

To every one remitting for twenty copies ($20,) an extra copy of the RURAL and either volume of the WOOL-GROWER AND STOCK REGISTER—or, THE HORTICULTURIST for 1855.

The same premium to every one remitting for FIFTEEN copies, ($30,)—for TEN copies ($15.)

To every one remitting for six copies ($10,) an extra copy of the RURAL, or the HORTICULTURIST for 1855.

For $5 we will send TWELVE copies of the RURAL, and either vol of the WOOL-GROWER AND STOCK REGISTER.

For $4 we will send nine copies of the RURAL, and either *Putnam's Magazine, the Knickerbocker, Lady's Book*, or *Graham's Magazine* for one year.

For $3, we will send a copy each of the RURAL and the HORTICULTURIST for 1855.

All competitors for premiums are expected to adhere strictly to the following

TERMS, IN ADVANCE:

TWO DOLLARS A YEAR. *Three Copies one year, $5—Six Copies for $10—Ten copies for $15—Fifteen Copies for $20—Twenty Copies for $25, and any additional number at the same rate.* ☞ *As we are obliged to pre-pay American postage on Canada Club rates to Canadian subscribers is $1,60 per copy.* ☜ *To facilitate mailing, we prefer sending Club pap rs to one address at each post office, but the names of subscribers will be written on the pap rs if desired. Club papers sent to different post offices and names can be sent in at different times. Bills of all specie paying Banks received at par in subscription.*

☞ Specimen Numbers, show-bills, prospectuses, &c., sent free to all disposed to compete for the Premiums, or who desire to extend the circulation of the NEW-YORKER. Subscription money, properly enclosed, may be mailed at our risk, if addressed to

D. D. T MOORE,
Oct., 1854. Rochester, N. Y.

BUFFALO SEED AND AG'L WARE-HOUSE,

No. 196 Main street, Buffalo, N. Y.

Ewart's Horse-Powers, Thrashers and Separators, Seymour's, Pennock's and Rose' Grain Drills, Hitchcock's and Sadler's Fan Mills,

Together with a full assortment of Hay Cutters, Plows and other Implements, always on hand, at lowest market rates.

N. B.—Country dealers supplied on liberal terms.

244 H. C. WHITE & CO.

CHEMICAL ANALYSIS.

J. BRYAN, Practical Chemist, 112 State St., Rochester, N. Y., is prepared to make *full and accurate* analysis of Minerals, Soils, Metals, Mineral Waters and Chemical Compounds, and Articles suspected of adulteration and *Poisons*, either organic or inorganic, and in quantity or quality. It is necessary to send one or two ounces of a solid, and a pint or more of a fluid for examination. 241-13t

HOME PROTECTION.

TEMPEST Insurance Company, Capital $250,000, Organized December 21, 1853; Chartered March 1, 1853. Homes only insured by this Company. No one risk taken for more than $3,000.

Many distinguished persons have insured their homes, to the amount of $3,000 each, in this Company, among whom are Ex-President Van Buren, Kinderhook; Ex-Governor Seward, Auburn.

AUBURN, May 16th, 1853.

To whom it may concern:—We are personally acquainted with many of the Officers and Directors of the Tempest Insurance Company, located at Meridian, Cayuga Co., N. Y. In our opinion they are among the most wealthy and substantial class of Farmers in this county.

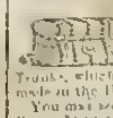
J. N. STARIN,
ELMORE P. ROSS,
THOMAS Y. HOWE, Jr.

The above gentlemen will be recognized as the Cashier of Cayuga County Bank, Auburn; Postmaster, Auburn, and Ex-Member of Congress, Auburn, Cayuga County.

N. B.—The public are cautioned to bear in mind the name (Tempest,) and not submit to an imposition daily practiced by twenty-four Mutual Co's.

211-tf T. B. TIBBY, Secretary.

TRUNKS AND VALISES



THE subscriber would inform the citizens of Rochester and the public generally, that he is manufacturing extensively, a very superior article of sole leather and steel spring Trunks, which he will guarantee to be equal to anything made in the United States.

You may see at PRITCHARD'S Trunk Depot and Sales Room, 78 State street, 1000 trunks and Valises, and he is now adding to this large stock from 125 to 150 per week—among which you may find Trunks varying from one dollar to fifty. If you should want anything in his line, give him a call, for he delights in "Large sales and small profits."

A. B. PRITCHARD, No. 78 State St.
Rochester, N. Y. Aug., 1854. 240-tf

Poetical.

[Written for the Rural New-Yorker.]

SPEAK GENTLY.

Enough of sorrow, enough of sin
Is veiled the smoothest eye within;
Enough of grief and bitter care
The lightest, gayest heart must bear.

Oh! speak not rudely, lest thy mirth
Should chill some aching heart of earth,
And the word thou hast so lightly spoken
Wound a heart that's already broken.

A gentle word hath a wondrous power,
It will calm the heart in the darkest hour,
'Tis a chord of music from harp-strings riven,
Which once were attuned to the songs of Heaven.

Rose Bower, 1854. MYRTA MAY.

Rural Sketch Book.

[For Moore's Rural New-Yorker.]

THE STUDENT'S CAREER.

A TALE OF EVERY-DAY LIFE.

BY EDWARD WEBSTER, ESQ.

[Continued from Page 361.]

Solomon had no very extensive preparations to make before leaving home for the scene of his future literary labors. A comfortable but plain wardrobe to park up, conspicuous among the articles in which was an abundant supply of home-made linen and hosiery, and a small bag filled with needles, thread and buttons, a lump of wax, a pair of scissors, and the other *et ceteras*, which are supposed to belong (although no one knows except the members of that most unfortunate fraternity) to a bachelor's kit.

"Solomon," remarked his mother, a thorough going and economical housewife, "you are now about to go away from home, and will not have a mother and sisters to look after your clothing. These things are put in for you to use, and you must not be too proud or too neglectful to use them either, when needed. If a button comes off your shirts, and the washerwoman overlooks it, sew it on yourself."

"Never fear me, mother; cash is not so abundant with me as to warrant either extravagance or folly. If I do not give a good account of myself in the end, lecture me then, not now."

"You boys are apt to be so careless!" rejoined the good old lady; "and when away from home go to dilapidation very fast."

"Not always in clothing only," added the son, good humoredly; "dilapidation in body, in mind, and in character, too, often occur. I have seen all this myself, circumscribed as my sphere of observation has been, and trust I shall not soon forget the blessed influences of a home, where one of the best of mothers has striven to guide my youthful feet in the right path." "Mother," he added with a good deal of feeling, "I have a difficult task before me, and may fail in the accomplishment of my undertaking; but whatever the result may be, you at least will give me credit for doing my best."

"Never fear, my son," responded the mother, wiping the moisture from her eye, "where there is a will there is a way! go on with a stout heart, make use of all honorable means, and trust the event with God."

Among the few friends on whom the young man called, in order to bid them adieu before leaving home for the first time in his life, was an old gentleman residing in the neighboring village, a rough, stern man, severe in appearance and address, and one who had a hard name among the generality of men. Woe to the dishonest debtor who fell into the hands of old Simon Bonesteel. The lazy, the shiftless, and the improvident, usually fared no better at his hands; but honest and industrious men, although dreading to be found in default, were generally much better dealt by when in real difficulty by him, than when found at the mercy of many other, and ostensibly better men. On being asked by the old gentleman how much money he had to depend upon in order to get through College, Solomon answered, "three hundred dollars."

"And you expect to pursue a four years course of study on such a sum as that? I have known a young man, and one not deemed extravagant either, spend two thousand dollars on the same course. You have not, I am afraid, counted the cost of this undertaking."

"Yes I have. I do not expect to finish the course upon that sum. I can earn something in the way of teaching winters, and when I can go no further, why I must suspend my studies and recruit my finances."

"Your object is a laudable one, at all events," rejoined the old gentleman; "and you deserve success whether you obtain it or not. Depend upon yourself as far as possible, but when you can go no farther, call upon me. I may be disposed, if you show yourself worthy, as I have no doubt you will, to lend a helping hand."

Solomon left for one of the New England Colleges next day. He was examined and admitted to the Freshman class, and for a time lost his identity among the numbers of his associates. In a body of young men, thrown together indiscriminately from all parts of the country, on terms of perfect equality, it takes a little time to discriminate and develop different traits of character. A new class is usually an epitome of the world at large. Different feelings, different notions, different capacities, different modes of thought and action are all mingled and jumbled together, in a mass, without cohesion or agglomeration, but soon distinctions begin to appear, the affinities of each draw him to others of his own turn of thought and feeling, and the skillful Professor who has his eye upon the class, very soon discriminates between the industrious, earnest student, and the one of the opposite tendencies. Our hero was not long in making a favorable impression, not by presenting himself before the Faculty and the class, and challenging admiration, but by attending strictly to his duties, and observing, under all circumstances, a becoming and orderly deportment. He made but few acquaintances, at least for a time, and was scarcely known for several terms, outside of the class and its immediate instructors.

When leaving for College, Solomon, from motives of prudence and precaution, took along only a portion of the small sum at his command, placing the balance in the hands of a safe person, with directions to forward it to him by draft, in such sums as he might call for. As the first fall term was drawing towards a close, finding his funds beginning to run low, he wrote to his trustee for a remittance of fifty dollars. Day by day he watched the post-office for a return, but was disappointed. His bills were falling due with no means to pay them, and small as they were, he was compelled to turn the creditors away. Even the poor washerwoman, who supported herself and a family of small children by the labor of her hands, was put off a week, in the hope and expectation of the remittance; but it did not come.—The last day of the term at length came round, and found our hero penniless. Never before had he been in quite so bad a predicament, and without a counseller or friend within five hundred miles, with whom to consult, the first severe obstacle he had yet encountered now loomed up threateningly across his path.

He had engaged a school for the winter, twenty-five miles from the College, in a neighboring town, and was to commence on the Monday following the close of the term, which occurred on Thursday; but still hoping to hear from his friends in the mean time, he wrote to the Committee to defer the opening of the school for one week. This week of suspense was one of the most unhappy he had yet experienced, and it waned away leaving him unrelieved in purse and unconsorted in mind.—The students had all taken their departure for the long winter vacation, and his lonely footfall as he passed along the empty hall, sounded as hollow and mocking as a sepulchre.

"If that man fails me," said Soloman, "on the small sum I have placed in his hands, then farewell to all expectations of a College course; my aspirations will be nipped in the bud, and I shall bid adieu to these halls and to a short-lived hope, and betake myself to some mechanical employment that shall at least afford me a comfortable living, and the means of paying my honest debts. I might write to Mr. Bonesteel, as he directed me to do, but it is too soon. He will not give me credit for any effort deserving of success, and besides he is under no obligation, either by pecuniary ties or ties of kindred, and what assurance have I of his regard, except the casual remark he made when I came away. But it will not do to despair too soon. I will put off the payment of my bills until spring, get to my school in some way, and then await the breaking away or the gathering still deeper of the threatening cloud. Thus soliloquizing, he set himself about his preparations for departure. He found no difficulty in putting off the payment of his bills, the frank open way in which he explained the matter, was satisfactory to all; it is far too apt to be the case, that students, even with harish means at their command, are compelled to let their accounts run over until they return again with funds replenished from the paternal treasury. Harish expenditures, and too often even criminal indulgencies, ruin the habits as well as the credit of far too many of our young collegiates. Far too many brilliant intellects have gone down in night and darkness, where the elements of the storm have been engendered in the vicious practices of a College life—a life where all others potent in immeasurable good, or fraught with the worst and most unmitigated evils. It is not, however, the fault of the system so much as the men; for the greatest and most glorious boon ever vouchsafed to men by heaven, if perverted, becomes a direful curse.

Our student, as we said above, set himself about his preparations for departure to the scene of his winter labors. Packing up a few articles of clothing in a carpet-bag, he was intending to set out on foot next day. It was now late in November; the weather had thus far been remarkably pleasant, and scarcely a particle of snow as yet had fallen, but winter was quietly mustering all its forces, and gathering strength for a fierce struggle for the mastery over retiring Autumn. During the night the north-east wind commenced blowing in loud and roaring gusts, accompanied by a thick fall of snow; and next morning the sky was so thick with the whirling and blinding wreaths, and the roads so blocked up with the piling drifts, that scarcely a man ventured abroad, or had courage to face the howling blasts. Twenty-five miles through such a storm, and on foot, was out of the question; so sitting down in his room, in a very melancholy state of mind, Solomon gave way to a feeling of utter despondency. At length, however, rising from his seat as a new idea struck him, he descended to the hall below, in which was situated the Treasurer's office of the College. That officer was alone in the room, busy posting up his books, and preparing an exhibit of his accounts for the inspection of the Trustees. With few words the young man requested him to go up for a moment to his room. The officer complied, and when seated, Solomon, after briefly stating the predicament in which he was placed, took from his trunk an elegant coat pattern, saying:—"Here are two yards of cloth, which cost me twelve dollars; if you will be kind enough to deposit it in your office, and lend me ten dollars until spring, it will be a very great accommodation."

"You are welcome to the use of the money," responded the Treasurer; "put back your cloth into its place, and before I return home I will call again, and give you the amount desired;" saying which the Treasurer withdrew.

Solomon had gone through the ordeal thus far with a tolerable degree of composure, but the feeling of utter humiliation which he felt in being compelled to make such a request, added to the prompt kindness and generous compliance of the officer, completely unmanned him; so sitting down beside the lonely grate, he burst into an uncontrollable flood of tears. He had not calculated upon an immediate return of the officer, who had in fact gone down to his safe, obtained the required sum, and at once stepped back to the student's room.—The predicament of the poor youth was if possible more lamentable than ever. He tried to conceal his tears, but in vain, and mortified beyond measure at being caught in such an undignified position, he rainly endeavored to elude the scrutiny of the officer, but after one or two efforts at choking in his emotions, to no purpose, as they became overpowering, he hid his face in both hands and wept like a child.

The officer was so taken by surprise himself, as to be completely at a loss for a few moments; but quickly recovering his self-possession, and judging correctly as to the occasion of the young man's manifestation of feeling, he spoke to him very kindly, commending the course he had taken, and paid high honor to the very tears of which the young man had been so much ashamed. He urged him to confide in him at any and all times, and if difficulties pecuniary or otherwise arose again, to consult him at once. Thus encouraged and soothed, the student resumed his wonted cheerfulness of temper, packed his trunk, and on the following day, as the storm had abated, took his seat in a stage sleigh, (for the railroad, since completed, was not then commenced,) and at the appointed time was on the ground, prepared for a winter campaign as a school-master. The interview with the Treasurer, although always contemplated with mortification by Solomon, found that functionary to him as a fast friend, and was remembered and spoken of by him years after the student's connection with the College had ceased.

From that day forward to the end of his College course, the clouds brightened in the young man's sky. The remittance, which, by its failure in coming to hand, had caused him so much trouble, had been duly sent, but miscarried; and after finding its way to the dead-letter office at Washington, was returned safely to the hands of the trustee. It was again dispatched under more favorable auspices, and with the balance then due the student, was at length received by him. This, with the avails of his winter's school, carried him through two years of his course, at the end of which he withdrew a year from the institution, temporarily took up his connection therewith, and taught a Union school; in which way he earned sufficient funds to carry him through the remaining two years.

Happening to meet his old friend Bonesteel during this interval of teaching, and, in answer to his inquiries as to how he succeeded, telling him of the unfortunate predicament in which he was placed during his first term, the old man exclaimed:—"Did I not tell you to apply to me, in case you found yourself in difficulty?"

"Certainly you did," answered Solomon; "but I felt that you was under no obligation to aid me, and besides, if I should die you would never be able to recover your funds."

"That is none of your business!" responded the old man indignantly. "If I choose to venture my money foolishly, who does it concern except myself? If you are so proud as to refuse a voluntary offer from a friend, you deserve to starve to death, and I hope you will! Remember," he added, "if such an occasion occurs again, and you fail to apprise me of it, I'll never forgive you for the insult to my generosity!"

"A thousand thanks!" said the young man, grasping the hand of his rough but generous old friend; "I shall certainly do so, but I trust there will be no occasion now. I can see my way clear, and if nothing happens shall come out triumphant. Your kind offer is as fully appreciated, and as gratefully acknowledged, as though it had been put to the severest test." In the case of how many a fainting heart, had such a generous support been proffered, would life, and hope, and glorious success have taken the place of failure, despondency, and ultimate despair!

[*Concluded next week.*]

Wit and Humor.

THE DISAPPOINTED.

I thought her mine; I thought the world
Shout forth with joy for me;
I did not dream in after years
Its folly I should see.

But so it proved. I sought her hand—
(I really thought I'd get her)—
But oh! alas! her answer came—
"*Her mother wouldn't let her!*"

TURKISH SEAMANSHIP.

Dickens, in his *Household Words*, states that at the close of the Greek insurrection in 1829, the Turks turned every Greek out of their Naval service. Henceforth they were determined to fight, work, and navigate their ships themselves. The first they could do indifferently well, the second and third not at all. The seamen draughted on board ship by the marine conscription did not know the use or even the name of one single spar, block, or rope, and the officers were utterly ignorant of the terms of the nautical vocabulary whereby to convey their orders to the men. Moreover the men could not have understood them if they had been as learned in nautical slang as an English boatswain or a Dutch skipper.

In this dilemma, the Turkish naval instructors hit upon an ingenious plan. They symbolized and named the various parts of the vessel by anything that came nearest to hand. They tied a pear, for instance, to the mainmast, a pomegranate to the mizenmast, a bunch of grapes to the foremast. The poop was distinguished by a string of onions, the forecastle by a basket of figs, the ropes by vine leaves or boughs of trees; the different sails by pipe-sticks, mutton bones, or any other convenient odds and ends.

Here was a new nautical dictionary invented at once:—"Haul down the pipe-stick!" "Take two reefs in the rice bags!" "Stand by the grape-mast!" "Go forward to the onion castle!" were as good words of command when the sailors understood them (which they soon learned to do) as the correct ones; and men who, on their arrival on ship-board, scarcely knew a clew-line from a hedge-anchor, or stem from stern, speedily acquired a competent knowledge of the different parts of the ship.

An Original Anecdote.—The Portland Argus relates, that Capt. K., a shrewd steamboat captain from the State of Maine, caught a "Jeremy Diddler" on board his boat one day, as he was making from Boston to "down East," and pinned him up in good style. It seems the fellow laid a traverse to get clear of paying his fare, and insisted to the clerk that he had paid but lost his ticket.

"Whom did you pay?" asked the clerk.

He rather guessed it was the captain; so K. was summoned to the conference.

"Oh, yes, yes," said Capt. K., "it appears to me, I do recollect. Let me see; you gave me a five dollar bill?"

"Yes," said the Diddler; "I did."

"And I gave you the change in half dollars, didn't I?" (The fare was only half a dollar—competition was high.

"Yes," says Jeremy, "that's it, I recollect it perfectly."

"Very well," says Capt. K., "I won't dispute your word for anything—but if you please, I should like to see the halves!"

The fellow was tripped when he least expected it. He could not produce the halves, and had to fork out his fare.

According to the newspapers, Mr. Hume, on the presentation of his picture, said that "his chief aim in life had been to promote the good of the greatest number." The reports omit to state that Lord John Russell here interrupted him with the question:

"What is the greatest number?"

And that Mr. Hume, with great promptitude, replied:

"*Number one*, to be sure."

On the marriage of Thomas Hawk, of Mansfield, to Miss Sarah Jane Dove.

It is not often that you see
So queer a kind of love;
Oh what a savage he must be
To *Tommy-Hawk a Dove!*

Have you seen the sign I have got for my business? said a vender of the ardent. Yes, every time I see your face.

To make a Russian name — imitate the "tchug" of a bull-frog, give one sneeze and say "Ski."

Does a man feel girlish when he makes a "maiden speech?" Answer next week.

Youth's Corner.

ILLUSTRATED REBUS, NO. 46.

☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 42 letters.

My 33, 7, 14, 26, 34 is an official expounder of the Mahomedan law in Turkey.

My 42, 9, 36, 19, 29, 3 is the shoulder of a Bastion.

My 40, 4, 41, 6, 7, 30, 10 is upon the route.

My 22, 15, 20, 31, 23, 8, 32 is a failure.

My 2, 17, 41, 28, 13, 25, 12 is a plant.

My 16, 11, 19, 21, 24, 19, 40 is prude.

My 38, 5, 18, 31, 15, 11, 29 is emblematic.

My 1, 39, 6, 13, 9 is a shout of war.

My 35, 31, 13, 6, 23 is a shout of pursuit.

My 15, 6, 4, 14, 28, 19, 10, 4, 38 is running together.

My whole was the dying words of an officer in the New York regiment of volunteers, who was killed at the battle of Chapultepec, in Mexico.

Leatherville, N. Y., 1854. C. S.

Answer to Illustrated Rebus No. 45.—*Mr. Editor—here are two dollars I owe you.*

Answer to Miscellaneous Enigma in No. 45.—*The sword and the pen.*

Answer to Charade in No. 45:

Your first is *Pike*, a beggar knave
In city and at court.
True—false—'tis at the Chancery bar
The lawyer's special sport.

But it is not in courts of law
A plea is ever rare,
Which sure your riddle's second is—
Or can the whole secure,

But when a plea is softest heard
In whisper or a sigh,
Or in a look—oh! then 'tis sure,
And *Pleasure* must be nigh.

There's many a plea made out of time,
And thus we often see
The silly lover make too sure
Before he makes his plea.

But these two words, when well combined
Both as to time and measure,
Will seldom fail to gain their end,
And solve your riddle, *Pleasure*.

☞ Mr. C. Moore, of Geary, Chau. Co., is authorized to act as Agent for the Rural New-Yorker, and for the Wool Grower and Stock Register, in the counties of Chautauque and Cattaraugus, N. Y., and Warren, Pa.

MOORE'S RURAL NEW-YORKER,
IS PUBLISHED EVERY SATURDAY,
BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

Subscription—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the Rural,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the Rural is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

Advertising.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance*. The circulation of the Rural New-Yorker is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

MOORE'S RURAL NEW-YORKER.

VOLUME V. NO. 47. | ROCHESTER, N. Y.—SATURDAY, NOVEMBER 25, 1854. | WHOLE NO. 255.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper.

CONDUCTED BY D. D. T. MOORE.

WITH AN ABLE CORPS OF ASSISTANTS AND CONTRIBUTORS.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete AGRICULTURAL, LITERARY and FAMILY NEWSPAPER.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for 6 months, in advance. For reduction to Agents, and those who form Clubs, see notice on last page.

ADVERTISEMENTS,—If brief and appropriate, will be inserted at 15 cents a line, each insertion. ☞ No Patent Medicine, or deceptive adv'ts, published on any terms.

Rural New-Yorker.

Progress and Improvement.

SEASONABLE NOTES AND SUGGESTIONS.

LISTEN to the unmusical and unmistakable voice of Old Boreas, as he modestly yet distinctly introduces his piping notes in the shrill blast and initial snow-storm of the season!—Though somewhat later, and less boisterous than usual at this period of the year, he will soon become as grim and forbidding as of yore—creating a change in the temperature, and certain elements, interesting to others beside the Clerk of the Weather. And notwithstanding his sojourn abroad has been unusually prolonged, this season—thereby vouchsafing us a remarkably warm and pleasant fall for out-door operations and recreations—we may now anticipate the customary series of high breezes and hard freezes, with the general accompaniments noted in the programme of WINTER.

Reader, are you prepared for the advent and annual reign of the unwelcome, though of course not unexpected, monarch? If nay, you have no "spare moments,"—and it behooves you to immediately put all and sundry your goods and chattels, wives, tenements and hereditaments in proper order to withstand the ordeal of moisture and frigidity so rapidly approaching. In the language of PROMPTER—who has addressed the readers of the RURAL well and wisely, on various topics, in former volumes—"Is the wood-shed filled and the cellars banked, and all the perishables properly housed or secured?—the animals protected against colds and storms, and the fattening swine kept clean, warm, dry and well fed?—Racks and feeding bins ready for fodder-ing, to avoid the tramping of cattle and destruction of one-half the feed? Are all the summer used tools under cover, and everything picked up and put in place, preparatory to winter snows and sleets and rains?"

Our sage and experienced friend also suggests that it would be well to see that the fall plowing is finished, and the wheat fields drained. Hogs should be killed early, unless you can feed cheaply, and thus increase their weight economically. Yard cattle as soon as may be, and keep them within the enclosure till spring, if you consider manure worth saving. Litter yards, and particularly sheds, if you would convert the straw into manure, and induce the animals to become agents in the important work.

Having completed all necessary farm operations, look to the condition and conveniences of dwellings and out-buildings. See to the roofs and windows and cellars. A shingle or piece of board is worth more in a crack or crevice than in the store. In the matter of repairs and improvements do not forget that "a stitch in time saves nine"—that a little trouble and expense now may prevent much vexation and loss in future. Attention to these items—and the securing of a liberal supply of fuel for household use, beyond the contingencies of the weather—will not only enhance your individual interest, but promote the comfort and happiness and contentment of your family.

In preparing for Winter do not forget the wants and requirements of the poor and needy, the unfortunate and afflicted,—and let your charity and benevolence extend beyond Thanksgiving Day. Remember that all kinds of provisions are so high that many indigent people must suffer—at least unless fully employed, or otherwise encouraged and assisted. Give such, and especially those who are worthy and industrious, an opportunity to labor if possible. There are many odd jobs, and needed if not contemplated improvements, upon which you can advantageously give them employment—and in doing this you will demonstrate both your wisdom and humanity.

Last, but far from least in importance, provide liberally for the Intellectual Improvement and Entertainment of yourself and family.—Make suitable provision for the education and advancement of your sons and daughters.—Not only see that they attend school, but personally examine into the character and qualifications of their teachers. Provide, also, proper text and other books, and see that a liberal use is made of that invaluable provision, the School Library. Schools, like books and newspapers, are too often supported because they are supposed to be cheap, without reference to merit—whereas the price of tuition, &c., compared with the instruction and benefit to be derived, is of trifling importance. Speaking of books and papers, let those which you provide for general reading—the instruction and entertainment of the family circle—be of a useful and progressive character, and unexceptionable in moral tone. And after supplying yourself with the best journals, introduce them to the favorable notice and support of others. If the RURAL is of the number—which, indeed, we will take for granted,—please do us, and your friends, the favor of making the fact patent to community.

LIME AND ITS CHEMICAL CHANGES.

A READER of the RURAL desires us to give an article on the chemical changes which take place in burning and slaking lime, &c. Lime is not, as was once supposed, an *element*, but consists of the metal calcium united with the gas oxygen, and is properly an oxide of calcium, just as potash, soda and magnesia are oxides of potassium, sodium and magnesium. It is never found pure in nature, except occasionally in the craters of volcanoes, but is usually united with carbonic acid gas for which it has a strong attraction. In this state it is neutral, and insoluble in pure water.—When limestone or any other form of carbonate of lime is exposed to a sufficiently high temperature with access of air or moisture, the carbonic acid gas is driven off, and the lime which remains is called *quick* or *caustic*, from its strong alkaline reaction. When such lime is plunged into water for a short time, or water is poured upon it, heat is evolved, the lime swells, cracks, gives off much watery vapor, and finally falls to a powder. This powder, or slaked lime, is a *hydrate* of lime, water being chemically combined with it. In this state it is still caustic, though somewhat milder than when fresh from the kiln.

The rise of temperature is so great when large heaps of good lime are suddenly slaked, as to inflame gunpowder and scorch wood; it certainly exceeds, accordingly to PELLETIER, 500°, and when the operation is performed in a dark place light is also evolved. All sorts of imaginary causes have been assigned to account for these phenomena. They are referable, however, to a very-simple and universal law. All substances during their change from a gaseous to a liquid, or from a liquid to a solid state, evolve heat, and *vice versa*. The intense cold produced by liquifying ice or snow by admixture with salt is a familiar instance of the latter; and the heat evolved in solidifying carbonic acid under intense cold and pressure is sometimes dangerous evidence of the former—the expansion of air consequent on the sudden liberation of heat from the carbonic acid in the moment of congelation, not unfrequently shattering the vessel to atoms.

Lime in slaking will absorb one-fourth its weight of water; but the slaked lime is not more moist than before. The water unquestionably, therefore, is chemically combined with the lime and becomes *solidified*; and it is simply owing to this solidification and chemical combination of the water that heat is evolved.

Caustic lime has a strong affinity for water and carbonic acid. When kept in a dry place it gradually slackens; cracking, splitting and crumbling to powder with the evolution of heat—which, however, is not so perceptible on account of the length of time during which the process is extended—just as though it had been slaked by pouring on water. In this case the lime has obtained the 25 per cent of water it needs to slake it from the atmosphere.—There is this difference, however, between *air slaked* lime and that which is water slaked.—The former is slaked precisely as the latter by the absorption of water, but it also absorbs carbonic acid from the air, and instead of being simply a *hydrate* of lime as when water slaked, it is a definite compound of hydrate and carbonate of lime, 42.6 per cent of the former, and 57.4 of the latter. *Air slaked* lime, therefore, is far from being so caustic as water slaked—upwards of one-half of it being reconverted into the same chemical state it was in before burning.

After the lime has absorbed sufficient water and is completely fallen to pieces, carbonic acid is absorbed much less rapidly, especially in damp situations. In fact, though there is a constant tendency in lime to return to the state of carbonate in which it existed previous to burning, yet, by mere exposure in the air it does not attain this state in any assignable time. In some walls 600 years old, the lime has been found to have absorbed only one-fourth of the carbonic acid necessary to convert the whole into carbonate; in others, built by the Romans 1800 years ago, the proportion absorbed has not exceeded *three-fourths* of the quantity contained in natural limestone.

When slaked in the ordinary way, by the application of water, lime falls to pieces with-the absorption of but little if any carbonic acid. But when slaked and exposed to the air the absorption of carbonic acid is at first very rapid, but it gradually becomes more slow, and probably the same definite compound of hydrate and carbonate of lime is formed as in the case of air slaked lime.

The original limestone, or any other form of carbonate of lime, then, is perfectly mild. By driving off the carbonic acid by heat, we get lime which is very caustic. By slaking this with water, we get a less caustic substance—hydrate of lime. By allowing it to air slake, we get a still less caustic compound, a definite compound of hydrate and carbonate of lime. And by exposing it to the air for a sufficient length of time, we ultimately get the whole reconverted again into its original mild form of carbonate of lime.

BOOK FARMING.—Speaking upon this subject, the Hon. KENNETH RAYNOR, in his address before the N. C. State Ag'l Society, says:—"At the time this prejudice was first excited, I am inclined to think there was some reason for it." It attempted (we do not quote his exact words) to bring foreign practices into countries with a different soil and climate, as well as different wants. But science, united with practice, soon exposed the fallacy of such book farming as this. Because turnips and beans and hops are among the most profitable crops in England, is no reason why they should be so here. Because blue-grass is so valuable a crop in the limestone regions of Kentucky, is no reason why we should exhaust our energies in trying to establish its general culture in North Carolina. Such errors as these, such book farming as this, it is the purpose of scientific agriculture to point out.

"SOMETHING NEW."—The *New England Farmer* says that at the Farmer's Club in Boston, there was exhibited lately an artificial cow, constructed for the purpose of weaning the calf!—a sham brindle, with sham teats, yielding milk and water! But what's to be done in the matter of weaning the cow herself, who mourns the loss of her darling as if she was gifted with reason?

THE accompanying engraving portrays an English Cart-horse, to which was awarded the highest prize of the Royal Agricultural Society. Horses of this breed are of large size, distinguished for strength and endurance, and well adapted to slow, heavy draught. They have for many years constituted some of the best heavy horses in this country. The stallions imported here have produced excellent team and carriage horses from our well-bred, good sized mares.

Our principal object in presenting the cut is to give the terms used in describing the external parts of the horse. These will be interesting to many of our readers, and particularly to those not familiar with the subject.

CLEARING AND IMPROVING MARSHES.

THE last *Transactions* of the N. H. State Ag'l Society contains several interesting statements from the competitors for premiums offered by the different County Societies for the improvement of Bog Meadows, and Marsh land generally. This is a matter of wide-spread interest—there is much such waste land in most sections of the country. Hence we make no excuse for repeatedly alluding to the subject—for bringing all the good examples of clearing and improving marshes prominently before our readers.

G. C. BROWN, of Stratham, had a marsh or pond hole, covered with bushes in part, and filled with water in the spring season, which he reclaimed so as to make it the most profitable three acres of his farm. He first dug a ditch through the centre, and lowered the outlet, and then cut off the bushes, near the ground, and by continued cutting and burning nearly destroyed their roots and the mosses which covered the surface. He next tried the plow, and with a great deal of labor, on account of the logs and large roots which filled the soil, tore up the most of it, and seeded a part down to grass in June, 1846. This was mowed the September following, and gave a ton of hay to the acre. The next season he mowed it twice and got in all about three tons to the acre.—Last year he plowed and spaded the marsh over again, and has the whole seeded now to grass, and in excellent condition.

The soil is a clear peat from two to ten feet deep, and in Mr. B.'s opinion, possesses a mineral acid, needing some sort of manure to correct it. He has used leached ashes, applying them with excellent effect at the rate of about one hundred and twenty-five bushels per acre. He has also used barn-yard manure, lime, and dry ashes, but prefers ashes on account of their containing no foul seeds, and being less bulky than yard manure.

We are sorry the statement contains no account of the expense of the improvement—One year's crop was sold for $100. The marsh is still soft and miry in the lowest parts, and evidently needs a deeper drain so that it may settle sufficiently firm to bear up teams at all seasons of the year. He now has to keep off cattle, and uses a wheelbarrow for carrying the ashes upon the miry spots. The meadow is a beautiful sight, and notwithstanding the expense put upon it, Mr. B. is well pleased with his experiment. That the committee were equally so, is shown by their awarding him the first premium.

Another statement was made by J. GODFREY, of Hampton Falls. His meadow contained one acre and five-eighths, and was a bog formed by springs on the hill-side above it, without any outlet save by evaporation.—The muck was from two feet to six inches in depth, and the surface quite uneven, but without bushes, and covered with brakes and water grass. He drained it by an open ditch, cut and drew off the hassocks, and then plowed it up into beds. After plowing, the water furrows were cleaned out and the mud spread evenly over the beds, and these were then covered with gravel at the rate of forty loads per acre. It was then sown with herds-grass and red-top, and the seed harrowed in by hand with a brush harrow. It was not all done in a year, but this was the course pursued with the whole meadow.

The yield in this case was about one ton and a half per acre for the first crop in July, the second in September was nearly as good, but was pastured off by turning in calves. No manure was applied—and the amelioration has evidently been effected by the application of gravel and the admixture of soils. Here, too, no account is given of the exact cost of the improvement.

Mr. DODGE, of Bennington, reclaimed a meadow of five acres in the same way—first draining, then breaking up and covering with sand and gravel. This crop has been mostly foul meadow grass, grown for seed. He has saved from thirty to sixty bushels of seed per year, besides a large amount of fodder. No manure has ever been used, and the experiment, to use his own words, "has been very profitable."

Other statements are given, but none containing any hints not already presented. These show that notwithstanding the large cost of draining and clearing such bogs, all unite in pronouncing the enterprise a profitable one.

STABLING COWS.—To prevent cows from lying in their manure when in the stable, says a correspondent of the Albany *Cultivator*, have a gutter drop immediately behind the cows, 6 inches deep and 16 inches wide. If cows are fastened with yokes, they need about 4 ft. 9 in. to stand upon. By having the stalls long enough you have a walk back of the drop which is convenient for walking on, setting pails, &c.

CONVERSATIONS ON AGRICULTURE.—NO. 8.

BY HUGH T. BROOKS.

THE RIGHTS OF ANIMALS.

It may, or it may not be a new idea to our readers, that brute animals have *rights.*—Rights they certainly have, though blundering law-givers have neglected to proclaim their "*Bill* of rights." "Life and liberty" may properly be referred to Messrs. GRAHAM & GARRISON, but "the pursuit of happiness" we propose to attend to at once. *Man*, with characteristic greediness assumes that he is *every thing*—and the *brutes*, as Abbe SIEYES said of the *tiers-etat*, "*nothing.*" Why so? Has not the brutes the right of occupancy? Were they not peacefully feeding on the river banks when the sixth-day wonder appeared? Did they ever rebel against the Supreme Authority and violate the condition of their lease?—Granted that man was to have "dominion over them." Was the *dominion* a *despotism* without *Constitutional* restraint? Here is the "higher law!"—"Thou shalt not muzzle the ox when he treadeth out the corn." "A merciful man regardeth the life of his beast."

POPE'S "Essay on Man" is dimly reflected by our school boy memories; it contains lines somewhat after this fashion:

"Is it for thee, the linnet soars and sings?
Loves of his own, and raptures swell his notes."

Having *finished up* the book as we progressed with our reading and parsing lessons, we are scarcely able to determine by counting our fingers, whether we have purloined any of the syllables that rightfully belong to those lines or have added some of our own which POPE would not be willing to recognize—at any rate we have got his idea—and a great one it is—that the lower animals have enjoyments *per se*, pleasures of their own by natural right, not as appendages of man, but as separate and independent existences, and by inference, whenever by our agency a brute's life is barren of enjoyment, a *great wrong is perpetrated.*

Let those who undervalue what brutes suffer or enjoy, wait for the *verdict* in a case now pending, viz:

Canvass-back & Burgundy Gentleman,
versus
Calf fed on New Milk.

This is an action brought by a guest of the "*Metropolitan*" to prove his superior *tastes* and *pleasures*, which the defendant while skipping on the lawn in a bright morning had been led to dispute.

In all seriousness we protest against the narrow selfishness that governs our conduct towards brutes. The noble ox is not only burdened and butchered in the cause of humanity, but his life is made dreary and desolate.—The "fast" horse is driven till his sufferings are intolerable, as he who doubts may see by running himself at the top of his speed till he is ready to fall dead by effort and exhaustion.—Swine, dear to all Gentiles, often "shirk" for a living, and if perchance they seek from a neighbor the food and shelter denied at home, they are kicked and cudgeled for their owner's sins.

Perhaps the most general fault is in neglecting to provide *comfortable winter quarters* for domestic animals. Animals usually become tender by domestication. In a wild state they have a choice of location—there being no "fugitive law" in force, they can spend their winters in a warm climate; dependant on themselves, they are fruitful in resources. Then, too, the whole face of nature is changed, the dense forest gives place to the cleared field, and the animal which could choose the tangled thicket and the overhanging rock for a shelter, is forced by some admirer of "nature's plan" to stand in rainbow form and brave the tempest in an open field. In this way large droves of sheep and cattle are exposed, we are sorry to say, by men of large wealth and intelligence.—So too the owner of *one* cow will feed the faithful animal from a stack of stalks or hay, in all weather, on the *ground*; and though slabs and boards are abundant, the persecuted creature cannot by despairing looks and piteous moans, persuade the heartless owner to put a a few of them up to break off the wind, the snow and the rain.

Sheep, when dry, endure the cold very well, but when cold weather succeeds a rain, their wool is first wet and then frozen, and thus they are greatly injured. The writer usually winters a thousand sheep, and other animals in proportion, but he makes it an invariable rule to have racks *under cover*, so that every animal can be protected while eating, as well at all other times.

Let it be the first business of every man who has not already made provisions for the comfort of his stock to make them at once.

Animals exposed to the cold require more food than those which are kept warm—the degree of warmth and confinement must be determined by careful experiment.

Lumber is much cheaper than hay. When self-interest unites with human considerations in demanding a change, why should we not have it?

AXIOMS IN SHEEP HUSBANDRY.

MESSRS. EDS.—It is an axiom with good shepherds that sheep should never be permitted to *get poor in the fall.* Hence, as the feed becomes short and frost-bitten, especial care should be given to the flock, and here the farmer often finds himself at loss. He wishes to spare his store of fodder as long as he can, and, while the ground is bare of snow, sheep care little for hay, unless shut entirely from grass. Between "hay and grass," sheep often lose an amount of flesh which they are not able to regain through the winter. A good plan now is to give them the best food to be had, yard them on cold or stormy nights, feed them a little good hay or sheaf oats, in the morning and let them run during the day if the weather is sufficiently moderate. Remembering that they need care and attention, and that they should be kept in as good condition as possible, use your own judgment as to the means employed.

Another axiom is, never let a sheep *grow poor in winter.* It is very hard work to recruit and bring up a half-starved sheep, even if not diseased; and often when the warm days of spring come, they fail one by one, and the careless farmer's back lots are strewn with scattered crowbaits. The best remedy is to *keep them from getting poor.* If one have a large flock the sheep should be classed off early in winter, into smaller flocks, according to their age and strength, and then be fed accordingly. If they once get poor, a little grain seems to have no good effect; but a little grain given to a sheep in good order, will assist a good deal in keeping them so. It is a pleasant business to feed a fine flock of sheep in steady cold weather, while nothing can be more unpleasant than the care of a poor, half-starved flock, in the trying weather of March and April.

The true way is to *never let sheep get poor at any season of the year.* This is *the* axiom in sheep husbandry. S. R.

WHAT IS BUTTER LAND?

EDS. RURAL.—The editor of the *Genesee Farmer* in a severe criticism on the excellent speech of Hon. A. B. DICKINSON, of this town, made at Wellsboro, Tioga Co., Pa., condemns as theoretical one of the best "practical speeches" it has ever been my lot to read. He quotes from Mr. D.'s speech: "The first quality of butter land is confined to portions of the New England States, New Jersey, Pennsylvania and New York, while cheese may be made and sheep grown wherever grass grows"—And then adds, "here the agricultural public is favored with a somewhat greasy theory about 'butter land,' by a professed theory hater.—It exists in portions of New England, but not in Ohio, Indiana, Michigan, Illinois, Wisconsin or Iowa. They may have fat land—pork and tallow land—but not land adapted to the production of butter." Then the astute editor reverts to a meeting of learned men in Buffalo, years since, when Mr. D., an unlearned man, made a speech, which sounded ridiculous to the men of Colleges there assembled. And this is all he finds to prove the falsity of Mr. D.'s first theory. Now, had he first turned to the Patent Office Report, for 1850-51, *(compiled by the said editor!)* he would have found this same theory in these words: "It is now a generally admitted fact that *good* butter cannot be made south nor west of Pennsylvania." Here is what the learned editor condemns as theory is advanced, advocated and proved by years of experience.

He quotes again what he calls theory, regarding the production of butter from pastures of certain grasses named by Mr. D., and then asserts that good butter can be made from cows feeding on corn stalks. This Mr. D. contradicts to me, admitting though good butter may be made from corn stalks, yet while that from the grasses named by him will keep for a long time as good as when made, that from corn stalks soon becomes rancid. Not the poorest part of the joke of this criticism is found in the fact that the *Genesee Farmer* was the only agricultural paper receiving favorable mention in Mr. DICKINSON'S speech.

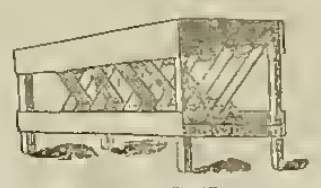
W. H. GARDNER.

Hornby, Steuben Co., N. Y., Nov., 1854.

RULES FOR BUTTER MAKING.—The Massachusetts Committee on Dairies says:—The newer and sweeter the cream, the sweeter and higher flavored will be the butter. The air must be fresh and pure in the room or cellar where the milk is set. The cream should not remain on the milk over thirty-six hours.—Keep the cream in tin pails, or in stone pots, into which put a spoonful of salt at the beginning, then stir the cream lightly each morning and evening; this will prevent it from moulding or souring. Churn as often as once a week, and as much oftener as circumstances will permit. Upon churning add the cream upon all the milk in the dairy. Use nearly an ounce of salt to a pound of butter. Work the butter over twice to free it from the buttermilk and brine, before lumping and packing. Be sure that it is entirely free from every particle of buttermilk, or coagulated milk, and it will keep sweet as long as desired.

Good fences make good neighbors.

Agricultural Miscellany.



SHEEP-RACK.

THERE is a *right* way of doing things, as well as a wrong, and the accompanying cut, from the *Michigan Farmer*, shows *where* to put hay and other fodder for sheep. Such racks will pay for themselves several times every season, in the saving they effect—to say nothing of their convenience and "the looks of the thing." We hasten to lay it before our readers for their adoption. The dimensions are as follows:—Width 26 inches; height 40 inches; trough one foot from the ground; slats two inches wide.

GRASS-SEED HARROWS.

BRUSH harrows are very imperfect, and constantly liable to get out of good working condition by clogging and matting together. Generally speaking, however, we have no substitute for them for harrowing in grass seed. There is no doubt that harrows made in the ordinary way, but with much smaller and more numerous teeth would answer an excellent purpose, and far exceed in perfection of work, any brush harrow. We would make the following as a suggestion, which we have never tried, and for which we shall charge nothing for the patent-right. Procure pieces of inch and a half or two inch plank, four or five feet long, and about a foot wide, of hard elm or any other firm wood, hard to split. Drive through these at regular distances, large-sized *cut-nails*; perhaps 12 or 20d. nails would be of suitable size. Let them be driven in as far as the head, so as to project a few inches on the other side. Now let several of these spiked pieces of plank be hinged together, and the instrument is completed. A harrow is formed with small teeth, as numerous as may desired; and it is evident that a single passage of this harrow over an ordinary plowed field would give it a surface as fine and as mellow as that of the most finished onion-bed; and that if the surface has been previously levelled by harrowing, grass-seed may be raked in by means of this instrument in the most even and perfect manner, to a depth which may be regulated by the size of the nails used in its construction.

As very few soils are perfectly free from grass roots and stones, it will be necessary, in order to prevent clogging, that the nails should be driven *obliquely*, so as to *point backwards.* This will enable them to mount any obstruction readily, and to clear themselves with facility from any matter tending to clog them.

A strong recommendation of this plan is its *cheapness.* Fifty cents in all for plank, nails, and hinges, with a few hours work, would probably complete the whole.—*Country Gentleman.*

THE BEATSON SYSTEM OF TILLAGE.

IF there ever was a season adapted to Major General Beatson's system of cultivation, it must be the present one. It principally consists in pulverizing the soil *without the intervention of plows*, or, in fact, by the aid of scarifiers or grubbers, together with the various harrowings, rollings, and the like, necessary to bring it into a thoroughly pulverized state, duly prepared to receive the seed. The present is certainly an unexampled season for the facilities it affords for thus pulverizing, cleansing, and preparing the soil for the ensuing wheat crop; and if it can thus be done effectually, the saving of labor will be very great. My object in this paper is to call attention to this particular point in autumn culture.

Every good farmer has undoubtedly been incessantly engaged during this beautiful weather in cultivating and cleansing his land. The appliances are so many and so good, that perfect tillths may readily be obtained. In my own occupation I have broken up a considerable breadth of land with Bentall's scarifier, and cross'd it with Biddle's scarifier, and in this way have obtained a deep and highly satisfactory preparation for the wheat seeding, at a moderate cost, and without the aid of a plow; and as my land is subsoil drained, I purpose after all requisite harrowings to drill in the seed, and thus save the expense of plowing and other subsequent management. No one can be a greater advocate for the due use of the plow than myself; but with favorable seasons like the present ones, the adoption of the scarifying mode of breaking up land is preferable. I do not advocate breaking up clover leys or seeds in this way; for these a good ploving is best, to be followed in about 21 days by a powerful scarifier, to cross the furrows and tear the whole into pieces. If the season continues dry, this with a few harrowings will make an admirable seed-bed.

For bean and pea land the scarifier is the best implement; it may be easily worked to the depth of ordinary plowing, and the whole of the dead haulm, rubbish, &c., being on the surface, it can easily be collected and then taken to the fold-yard to be converted into manure. In all cases where the land is not subsoil drained, it is necessary to plow in order to "lay up" the lands for surface drainage; but it is not requisite where good drainage has been effected; the "laying up" the lands is not of great importance, it being borne in mind that subsoil drainage is by filtration, not furrows.—PRACTICAL FARMER, *in Mark Lane Express.*

THE best method of wintering bees is to let the hives remain in their summer position and protect them, either by an outer hive, or by surrounding the hives with hay, or straw.

WASTE LAND.

"Much has been written upon this subject, yet more remains to be said, before our farmers will understand its importance." Such was the thought that crossed our mind, while pushing our way through a swamp in New Hampshire, a few days since.

There it was—a level of land—of one hundred acres, embosomed among the hills; and there we were, up to our eyes in grass, and yet sheltered from the burning sun by a growth of alders. The blue-joint, and high meadow grasses (we discard Latin and use such names as the farmer will recognize) stood at least two tons per acre. Years agone, the beaver carried out his primitive engineering, at a narrow passage, where the high lands come together, and thus destroyed whatever of forest growth stood within reach of the rising waters.—Nothing has since grown upon the spot, save generations of alders and wild grass. Twenty years since the scythe gathered the grass in the more open parts of the swamps, but the alder has gradually become an army of occupation, and asserted his right to the whole territory.

This is but one of many examples. Thousands of acres in New England are in like condition. All may not be equally fertile, with the case mentioned; yet most are capable of being made so. There are some localities, which, for the present, should remain as nature has left them, but nine-tenths of the low lands of New England can be made remunerative.

Sit down now, *practical farmers*, and count the cost of turning that unsightly swamp just over the way from the house now, yielding nothing but miasmatic vapor, into a fertile piece of land; whose beauty shall charm the eye, and whose products shall be wealth. Is it to be drained—are bushes to be cut—are stumps to be pulled? Make your estimates, and then upon the other side, count the value to be received. It is a simple process and will cost but a few minutes of observation and calculation. Our word for it, you will put in the spade, the ax, and the mattock at once. The dry summer has ripened the corn and your harvest is out of the way. Strike, then, at the swamp; and make it what we think it will be—the most remunerative land in your possession.—*Jour. of Agriculture.*

HORSE RACE IN THE SANDWICH ISLANDS.

THE women and girls are decidedly the best riders. With them, not as with the ladies of our Atlantic cities, side-saddles are out of the question. In their loose, flowing drapery, hair streaming in the wind, their beautifully erect position, and their horses careering along like the march of a whirlwind, they look majestically dangerous, and yet they are never thrown from the saddle. There is many a lady in civilized nations who would envy the equestrian skill of these Hawaiian women. There is many a finished artist that would be glad to have one of them as a subject for his pencil. It may be owing to this mode of exercise that they, in part, acquire such an exquisite development of form.

I wish I could fully portray these Saturday afternoon sports. Yonder, on the plain, some forty or fifty women are speeding almost with the rapidity of light toward some well-selected goal. Every nerve and muscle of both horses and riders is stretched to the utmost tension—the former from sheer instinct to gain the victory; the latter from a spirit of almost matchless daring, mirthfulness, and excitement. Now comes along a party of men and boys, many of them clinging, with their naked limbs, like leeches, to the flanks of their foaming steeds, while their restless hands and arms are describing all sorts of circles in the air, as if under pain of dismemberment, but, in reality, to cheer along their animals to a swifter speed.—Clouds of choking dust follow their wake.

Here and there may be seen a mounted foreigner, quietly looking on, or sharing in their sports. But yonder is a scene that defies all attempts at description. A few horses and donkeys, not under immediate use, but which a few minutes since were quietly feeding on the ever-living pasture, have caught the spirit of that fiery locomotion by which their companions are impelled over the plain. Unable any longer to control their nature, away they speed, in the utmost confusion, as though their powers of a life endurance were all concentrated in this single moment. Now they have mingled with the mounted animals, sharing their foam, and madly plunging through the clouds of dust, and endangering the life and limbs of any pedestrian who fails to get out of the way in time. On, on they speed, like fiery Arabians over their native sands, all and each one struggling for the mastery in the well contested race for glory.—*Sandwich Island Notes.*

SOME PUMPKINS.—The *Rural New-Yorker* says, "a pumpkin vine sprouting out of a manure heap at Pittsford, produced thirty-four pumpkins, whose aggregate weight was 592 pounds. These, says an Exchange, must be what people call "some pumpkins."

Friend Moore, you will have to try again.—Mr. N. C. Merritt, of this village, had a vine grow in his garden this season that produced 35 pumpkins, (counting 5 green ones) whose aggregate weight was 735 lbs. We think them's "some punkins," sure.—*Eaton (Mich.) Democrat.*

AN OLD STAGER.—At the Worcester Cattle Show, the citizens extemporized a cavalcade a mile long, containing 200 saddle horses, 55 spans, and 120 single horses in carriages. The Argus says that one of the horses was from Barre, and was 41 years old, but looking as hale and hearty, and drawing as well as any present. His owner uses him every day, and considers him capable of as much work as any of his young horses, and good for at least ten years more actual service.—*Wisconsin Far.*

CATTLE and hogs should be fatted rapidly now, both having dry and warm beds, and fed liberally.

Inquiries and Answers.

ROLLING WHEAT.—Will you please publish your views on the use of the Roller upon wheat, rye, oats, grass, &c. It is supposed that great benefits have been derived from the use of this implement, and I would like to be informed as to the proper time of using it, if indeed its use is beneficial.—R. W. HUMPHREYS.

We should be glad to have the experience of our practical correspondents on this point. It is the almost universal practice in England to roll the light land wheat, as early in the spring as the ground will permit; and it is therefore fair to infer that it is found beneficial, though we have seen no actual experiments which demonstrate this to be the case. If our readers have made any experiments on the point they would be very acceptable.

ICE HOUSES.—Will you or some of your contributors, through the RURAL, give us a plan for an ice house large enough to supply one or two families? Please give size, best place of location, material for construction, &c.—N. J. STIMSON.

We published an excellent plan of an Ice house in the RURAL of November 28, 1853.—But we believe in Progress and Improvement, and shall be happy to receive additional light on the matter.

FOUL IN THE FOOT.—I would wash and cleanse the foot with warm soap suds, then take equal parts of spirits turpentine and soft soap and simmer them together a little, and apply quite warm; two or three applications, at most, have always cured with me.—JACOB VIELE, *Seneca Falls, N. Y.*

WOODEN CISTERNS.—Twenty-five years ago last spring, the late HARVEY TUTTLE, of Fort-hill, in this town, constructed a cistern in the following manner:—He built a large tub—six feet high, and six feet in diameter, of an inch and a quarter pine plank or floor stuff—the staves 5 or 6 inches wide and jointed, made it "set work" as coopers call it, and hooped it with wooden hoops. He then dug a round hole in the ground under his wood-shed,—a little larger than the tub,—made a good mortar bed of clay, (not loam) and spread a good coat of this mortar all over the bottom of the hole. The tub was then pressed down on this mortar, and the mortar stamped or pounded in around the inside of the tub, and the whole then covered with boards. It has never had a penny's worth of repair, has never needed any—has never leaked—the frost does not injure it, and only the top of the staves show any signs of decay. It has lately been cleared out, and for aught that appears may last another 25 years—and the water does not become hard by long standing, as in cement cisterns.

LE ROY, Nov., 1854. S. PIERSON.

TRAINING OF WILD DUCKS.

A DAY or two since, while on a visit to "Ten Hills Farm," in Somerville, we were not a little surprised and interested in observing the movements of a number of wild fowl, which have condescended to live on the most friendly, if not intimate, terms with the happy proprietor and occupant of the old mansion, Col. Jacques. We had heard that the Colonel had a peculiar way of managing wild fowls and expressing a desire to witness his mode of operation in this particular, the old gentleman requested us to visit his poultry yard, and witness his experiment. The sight was an interesting one. But we can't say so much for the sounds. Among the number of fowls, all of which were in fine condition, were three India geese, three pairs of Chincha geese, three from India; fourteen Bremen geese; a beautiful wild turkey from the West, two three-quarters and three half breed. A venerable "mother goose," imported from Bremen in 1821, (thirty-three years ago,) was quite as active and noisy as any in the yard. The goose is supposed to be forty years old. She continues to do her duty, and several of her offspring of last season now weigh over twenty pounds. There were also nine wild black ducks, six pair of mixed ducks, several wild geese, &c.

The poultry yard was a large circular enclosure upon a marshy land, having a pond, rikes, drains, &c. The tide, on rising, brings in thousands of little fishes, which serve as food for the water fowls. Our presence startled the wild ducks which were quietly feeding in the pond, and in a moment they had flown.

The ducks rose several hundred feet, making a circuitous course, and hovering over the place, as if to ascertain the cause for alarm; then suddenly changing their position, they ranged themselves in two lines, forming an acute angle, and passed away to the northward apparently for a mile or two; then changed their course, and for a moment disappeared.—Col. Jacques used a whistle, producing a shrill sound, continuing the call at intervals. One of the flock—the guide perhaps—returned in the course of five minutes; hovering over the poultry yard, settling gradually, and uttering a peculiar cry; the flock soon approached, the guide settled in the pond, and in a moment was joined by his companions.

The Colonel's flock is frequently increased by wild ducks which visit Mystic River and ponds in the vicinity. The Col. has kept his implied contract with them, and will not suffer any fire-arms to be used on the premises.

Col. Jacques is one of the most successful of agriculturists, and his live stock is of the best breeds, and sought for by farmers all over the country. He is 78 years of age, has never been sick a single day, and for fifty years has subscribed and paid for a daily newspaper—a circumstance which fully entitles him to this notice.—*Boston Coronicle.*

Orchard and Garden.

THE NEW EDEN.

BY OLIVER WENDELL HOLMES.

When man provoked his mortal doom,
And Eden trembled as he fell,
When blossoms sighed their last perfume,
And branches waved their long farewell.

One sucker crept beneath the gate,
One seed was wafted o'er the wall,
One bough sustained his trembling weight;
These left the garden,—these were all.

And fit o'er many a distant zone
These wrecks of Eden still are flung;
The fruits that Paradise hath known
Are still in earthly gardens hung.

Yes, by our own untoried stream
The pink-white apple-blossoms burst,
That saw the young Euphrates gleam,—
That Gihon's circling waters nursed.

For as the ambrosial pear displays
The wealth its arching branches hold,
Bathed by a hundred summery days
In floods of mingling fire and gold.

And here, where beauty's check of flame
With morning's earliest beam is fed,
The purest painted peach may claim
To rival the celestial red.

MANURE FOR FRUIT TREES.

We select the following prescription, by A. J. Downing, from the second volume of the *Horticulturist*

The best compost for all fruit trees (without endeavoring to suit the wants of each particular fruit,) is a compost of peat or swamp muck, reduced, or rendered available to plants, by unleached wood ashes. The peat should, if possible, be dug and carted out in the winter, though it will answer if dug in the spring. As early in the spring as is convenient, mix thoroughly the wood ashes with the peat, in proportion of five bushels of good hard wood ashes to one wagon-load of peat. Let the heap lie a week, turn it over to incorporate more thoroughly, and in two or three weeks it will be fit for use. This compost, or manure, contains largely, lime, potash, phosphate, and vegetable matter, the elements most necessary to the growth and health of fruit trees generally—and in a state ready for food for these trees.

In a subsequent number of the *Horticulturist* is a letter from L. Wyman, Jr., of West Cambridge, in which he says:

I have used and recommended the compost you speak of in the March number of the *Horticulturist*, in your article on "Special Manure for Fruit Trees," as a manure for the pear tree in particular. I have usually added to the compost, say in measure, one peck of fine iron filings, or one peck and a half of crude turnings of iron, to each load of peat or muck, and in that proportion for a larger or smaller quantity; and have always noticed the most favorable result.

Two years since I applied this compost to a large pear tree which stood in a damp, loamy soil, but which had not borne any fruit of consequence, for six or seven years in succession, although it grew rapidly in size and sent out a large number of fine healthy shoots. The owner of the tree proposed engrafting some other kinds of scions upon the stock, it being a fine variety (the Andrews.) I recommended "one year's patience." He then said—"What would you do with it?" I replied—"I would attempt to remove it, or give it a better soil, and one more adapted to its wants." He remarked—"Very well, take it under your charge; I will spare it this year."

After examining the soil very carefully, I found, as before remarked, a clayey loam, quite damp, and the tree growing in a lone situation. I caused nearly all the earth to be removed from the roots of the tree, and the turf taken off in a circle seven feet in diameter, leaving the tree in the middle of a pan, caused by a removal of the soil and earth. I then applied a sufficient quantity of compost to fill the hole full, the whole new soil rising a little above the body of the tree. The quantity of muck used was one quarter less in this instance, as I believed the tree required not so large a quantity of muck as one would growing in a higher location, but rather more sand. I used sand. My compost was formed as follows: three parts of muck to one part of sand, and a proportionate quantity of potash water; and iron filings, one peck and a half to the load. The tall or leading shoots of the tree were shortened, the tree well scraped and trimmed, etc. The result of this application was a *full crop of pears*, and the tree making, the same year, a good growth of wood, every way healthy; the fruit, two barrels and one-half, grew fair and ripened well; and the tree has ever since borne a good crop, and continues to grow vigorously. This is, to my own mind, a sufficient test of the utility and value of the compost you commend in your widely extended and truly valuable work.

Salt, as an article of manure for the plum tree, I have long known to be valuable, and have used to a considerable extent.

Red Astrachan Apple.—This is a very beautiful and valuable apple—not of first quality for eating, but unequalled in its season for cooking. Very early; while yet quite small it makes an excellent pie. The trees bear young and abundantly; the fruit in clusters.—Gather them for cooking freely, thinning the fruit so as to leave, so far as you may be able to reach, only one or two in a place. By this two objects are gained—the fruit left grows larger and finer, and the palate is gratified.—Get one tree at least, and let it branch low so that a great portion of the fruit may be reached by means of a step-ladder. Ripens in August.

N. P. N.

THE CONCORD GRAPE.

Numerous correspondents write us that they were disappointed at not finding an expression of our opinion of this fruit, in the October number. We will give it now. It was presented, in large quantities, before the Pomological Society at Boston, and since then we have been able to examine it carefully at home, Mr. Ball having politely sent us a box of them. It is a large, handsome grape, both bunch and berry resembling the Isabella in appearance, save that the bunch is usually more compact and the berry rounder and has a thicker coat of bloom. It has the same foxy perfume and flavor of the Isabella, but stronger; when a few berries are eaten, a prickling sensation is produced on the tongue. This has been remarked by all who have tested it, as far as we know. It is very juicy, and we think will prove to be an excellent wine grape. For the table, however, we do not consider it equal in quality to the Isabella; and in this opinion nearly all disinterested parties, whom we have conversed with, agree. It was tested well compared with the Isabella, at Boston, grown at Weston, not far from Concord; and not one on the committee considered it as good. We have again compared it with Isabellas grown here, and the latter has been unanimously pronounced superior.

Yet we regard the grape as an important acquisition, as ripening earlier than either the Catawba or Isabella, and therefore likely to furnish northern sections with a grape, where heretofore no good grapes have ripened. It may be two weeks earlier than the Isabella, but not more, we think; for ripe Isabellas, *fully ripe* and *excellent*, grown within ten miles or less of Concord, were shown beside it at Boston. The location, however, must have been a very favorable one; for most people seemed surprised to see it ripe so early, and some, Mr. Hovey included, asserted very positively that they were not Isabellas but veritable Concords. Mr. Hovey adhered to this opinion, we believe, until he went out to Weston and examined the vine from which the Isabellas were gathered. From this one would suppose that there is a great similarity between the two grapes; and so there is; but the foxy and flavor are both different, as we have already said, and the canes of the Concord are much more slender than those of the Isabella.

We believe the merits of this grape have been exaggerated. It has been described as being "*free from all pulp*," and of a *very rich and luscious flavor*. Mr. Ball himself, however, described it as having "very little pulp," which is nearer the truth. We think it will, with the same treatment, be about the size of the Isabella. It appears to have a vigorous constitution, likely to escape mildew and other diseases to a great extent; and this is a very important quality. On the whole, we congratulate Mr. Ball on his successful attempt at raising seedling grapes; it affords him ample encouragement to continue his labors in this direction.—*Horticulturist.*

POTASH WATER FOR FRUIT TREES.

I had seen it frequently recommended in the public journals, to wash young fruit trees in a solution of potash in water; "one pound of the former to one gallon of the latter," is the rule laid down. Having several young trees in rather a sickly and diseased condition, and wishing to save them, but being somewhat fearful of the effects of this solution, I concluded to try it on one only of my trees, and be regulated in my subsequent proceedings by the result. I made my solution as directed, and applied it on a Thursday morning, carefully washing the entire trunk from the surface of the ground to the limbs. In one week from that day, the tree was dead, and on cutting in, I found the alkaline solution had saturated the wood even to the centre of the tree! Had I applied it to the others, they would doubtless have shared the same fate. I then reduced the strength of the wash—allowing one pound of potash to two and a half gallons of water, and no injurious consequences ensued. How potash water, made as in the first case, would operate on old trees whose bark is thick, I know not, but infer that it would be less likely to injure them than young trees.

On the whole, I would not recommend its use for this purpose in any state. Common soft soap, made into a strong suds, with water or whale oil soap, answers every purpose, and without any danger of killing or injuring the tree, imparts a vigorous action to the cutaneous organs, and to the system generally.—Where moss and other fungi are to be removed, I scrape the bark with an old hoe; scour them with sharp sand or ashes, and then apply the suds. In this way the roughest bark may be cleansed, and rendered perfectly smooth and bright. When I have once succeeded in depriving a tree of its parasites, I never permit it to become again covered with them, but wash and wash every fall and spring. I also keep the soil clean, light and rich about the roots. This is one of the best preventives that can be adopted for this purpose; for trees that are carefully managed and liberally manured, are seldom attacked by this, or any other disease. The system is retained in health, and will be so retained as long as the hand of a careful cultivator directs their development and growth. Trees, of all kinds, require much care.—*Cor. Ger. Tel.*

Horticulture as a Business.—If a young man wants to engage in business that will insure him in middle age the greatest amount of leisure time, there is nothing better than horticulture. If he wants to engage in a healthy occupation, let him till the soil. In short, if he would be *independent*, let him get a spot of earth; keep within his means, to shun the lawyer; be temperate, to avoid the doctor; be honest, that he may have a clear conscience; improve the soil, so as to leave the world better than he found it; and then if he cannot live happily and die contented, there is no hope for him.

Ashes around the roots of apples trees prevent the ravages of the borer.

WINTERING PLANTS.

Roses, of the Hybrid Perpetual, or Remontant tribe, do best laid down in the ground and covered with earth. This should be done when winter fairly sets in, and they should not be disturbed until the middle of April, or when all danger from winter is over. This species of the rose is said to be hardy in this latitude, but does best protected in this manner.

Bourbons, Noisettes, Teas and Bengal roses are all tender in Iowa, and will perish if left in the ground. They should either be put into pots and kept in the house, or put into a frame made of rough planks a foot high, with a shelter over them of boards or glass sash, and surrounded with straw. Air may be given them on fine days, and they will keep very well in this way. A dry cellar also answers a very good purpose in keeping roses.

Geraniums, Verbenas, Petunias, Carnations and other tender bedding out plants require to be kept in the house, free from frost, and also, if possible, from the dry heat of a stove. Many house plants are lost every winter from keeping them too hot through the day time.

Pinks, Sweet Williams, &c., will die out, unless protected by straw put over them when winter sets in, and kept on till spring.—*Iowa Farmer.*

The Grape Crop in France, it is said, "has proved almost a total failure, this year, thro'out the country."

Domestic Economy.

Good Light Paste.—Cut your lard when it is very hard, and roll it fine with as little flour as possible. Then turn in slowly, enough water to compact it together, and knead it till smooth. The oven door should remain shut until the paste is set. Nancy.

Sweet Potato Pudding.—Take half a pound of sweet potatoes, wash them, and put them into a pot with a very little water, barely enough to keep them from burning. Let them simmer slowly for about half an hour; they must be only parboiled, otherwise they will be soft, and may make the pudding heavy. When they are half done, take them out, peel them, and when cold grate them. Stir together to a cream half a pound of butter and six ounces of powdered sugar, add a grated nutmeg, a large tea-spoonful of beaten mace,—also the juice and grated peel of a lemon, a wine glass of rose water, a glass of wine, and a glass of brandy. Stir these ingredients well together. Beat eight eggs very light, and stir them into the mixture in turn with the sweet potato, a little at a time of each. Having stirred the whole very hard at the last, put it into a buttered dish and bake it three-quarters of an hour. Eat it cold.

Vermin.—Here is a "home item" which some of our house-keeping readers may find of value, if they are troubled with vermin in their houses, and desire to get rid of them before the summer is again upon us:—Take up your carpets, clean with your curtains. In a pail full of cold water mix well one pound of chloride of lime, having first diluted it into a thin paste in a bowl of water, for facility of mixture. With a mop, wet and saturate well the floor, skirtings, and any other wood work that will not suffer injury. Then shut the doors and windows. If there should be a suspicion of other tenants in the bedstead, take that down too. In three or four hours all will have disappeared or perished; but to insure perfect immunity from the plague, it might be well to repeat the lustration a day or two after.

Cabbages may be headed in winter by setting them with their roots in good rich earth just as they grow, and covering the tops so they will not freeze. This may be done with a roof of boards, hay or dirt, or brush, and rails and straw covered with dirt, with little air holes. Cabbage grown in this way is blanched, sweet and tender, and will pay much more than the cost of thus arranging the late stalks which failed to form heads in the fall.—The work should be done before the ground freezes, and at first only slightly cover the tops.

To Make Beef Tender.—Those who have worn down their teeth in masticating poor old tough cow beef, will be glad to learn that common carbonate of soda will be found a remedy for the evil. Cut your steaks the day before using into slices about two inches thick, rub over a small quantity of soda, wash off next morning, cut into suitable thickness, and cook to notion. The same process will answer for fowls, legs of mutton, &c. Try it, all who love delicious tender dishes of meat.

A good way of Cooking Onions.—It is a good plan to boil onions in milk and water; it diminishes the strong taste of that vegetable. It is an excellent way of serving up onions, to chop them after they are boiled, and put them in a stew pan, with a little milk, butter, salt, and pepper, and let them stew about fifteen minutes. This gives them a fine flavor, and they can be served up very hot.

To preserve eggs, rub them with butter or varnish. They will keep many months and produce chickens. The varnish should be removed before setting. Another mode is to pack them in salt, the point always downward.

Nerve and Bone Liniment.—Take 1 ounce spirits of turpentine, half a pint of brandy, and one gill neatsfoot oil; simmer over a fire till mixed, then bottle it for use.

Blacking for Shoes.—Three ounces ivory black, two ounces molasses, a table-spoonful sweet oil, one ounce vitriol, one ounce gum arabic, one pint of vinegar.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,
For the week ending Nov. 7, 1854.

D. C. Ambler, of N. Y. city, improvement in sewing machines.

John B. Brennan, Mt. Vernon, N. Y., improvement in locks.

Albert Boughton, Malone, N. Y., new machine for polishing stone.

R. S. Craig, Cincinnati, O., new form of trap for catching wild animals.

Reuben Daniels, Woodstock, Vt., improvement in water wheels.

Ferdinand Darison, Petersburgh, Va., stone drilling machine.

Jacob Green, Philadelphia, improved glass furnace.

Samuel Gomaer, Aurora, Ill., corn sheller.

S. S. Hawthorne, Orange, Ct., improved form of buckle.

A. K. Hay, of Winslow, N. J., improved glass furnace.

H. S. Higgins, of Graham, Ind., machine for manufacturing barrels.

Thos. Kendall, San Francisco, bottle stoppers.

Joseph Leeds, Philadelphia, improved furnace for heating buildings.

E. E. Marcy, N. Y. city, improved method of vulcanizing gums.

W. N. Martin, Bristol, R. I., new form of coal hod.

I. W. McGaffey, Philadelphia, improved potato digger.

Barnet McKeage, Accotink, Va., sawing bolts for staves.

E. T. Miller, Boston, improved bomb shell or grenade.

George Miller, Providence, R. I., improved leather banding for machinery.

Edmund Morris, Burlington, N. J., new form of slate frame.

M. P. Norton, Tinmouth, Vt., brakes for railroad cars.

Dewey Phillips, Shaftsbury, Vt., improved farm gate.

E. W. Riker and J. Murphey, New York city, improved method of desulphurizing gutta percha and other elastic gums.

E. W. Roff, Newark, N. J., new method of cutting tenons on blind slats.

Charles Rumley, Rochester, N. Y., steam engine valves. Do, improved rotary steam engine.

Isaac Searles, Newark, N. J., machinery for making hat bodies.

R. M. Selleck, N. Y. city, harness saddles.

James Slater, Macon, Geo., new mode of operating circular saws.

J. F. Smith, Hummelstown, Pa., corn shellers.

B. H. Washington, Hannibal, Mo., improved mode of directing air blast in furnaces.

Eldridge Webber, Gardiner, Me., machine for making shovel handles.

Charles Wilson, Springfield, Mass., improved lock.

Wendell Wright, of N. Y. city, improved lock for fire arms.

S. T. Thomas and Eliza Ann Everett, admrx, of Edward Everett, of Lawrence, Mass., improved loom beam.

John Jenkins, Monroe, N. Y., assignor to Roe Horton & Co., of Chester, N. Y., carriage tiring jacks.

John P. Avery, assignor to J. B. Bromley, of Norwich, Conn., stone dressing machine.

POSSIBILITIES OF RAILROAD SPEED.

A paper was lately read by Judge Meigs, before the American Institute Farmers' Club, at New York, upon the subject of rapid railroad traveling, and in which he said:

"I have, with others, admired the progress made in velocity far beyond any yet ventured to be expressed. The emperor of Russia has taken the first great step towards what I deem to be the ultimatum of railroad travel.

"Instead of cutting a narrow alley through the country, or going around everything in the way of a straight line—he has cut a broad way five hundred miles, from St. Petersburg to Moscow—he has made it all the way two hundred feet wide, so that the engineer can see everything that comes on the road.

"Such is part of the future; the railroad from point to point a mathematical line; the rails ten times stronger than any now used; the locomotives on wheels of far greater diameter, say twelve or fifteen feet; the guage of a relative breadth; the signals and times perfectly settled; the road, walled on both sides, during the transit of trains having the gates of the walls all closed. Then, instead of one hundred miles an hour, we shall safely travel three hundred miles an hour; I will not pretend now to say more—one hundred seems fast enough; so did twenty, a few years ago; and now, on very straight rails, or some straight runs, we do travel sixty miles an hour in this State, and in England one hundred miles have been accomplished.

"Mathematical precision and time will solve this problem—a passage from New York to San Francisco in ten hours!"

We have no doubt of one hundred miles an hour, being a perfectly practicable railroad speed, by the building of such railroads as those described by the Judge, and this opinion we expressed in the columns of the Scientific American some years ago. But three hundred miles an hour inclines us to the foggy side of the question. This speed would require a piston velocity of 3,300 feet per minute, of eighteen inch stroke, if the driving wheels were twenty-four feet in circumference, (nearly eight feet in diameter—whoppers) and they would have to make 1,100 revolutions per minute. As the wheels cannot turn round without steam, the query with us is, the means of raising the steam necessary to perform this feat, as the boiler would have to evaporate near a ton of water per minute—sixty in the hour. So far as it relates to the final velocity of steam in a vacuum, the speed of three hundred miles an hour could be obtained, but how can such a quantity of steam be evaporated in a locomotive boiler, in the space of time?—Judge Meigs may perhaps be able to answer us. With respect to the velocity of bodies, our ideas are bounded by what has been performed before our eyes,—the flight of the swallow, the pigeon, the eagle; but when we look to the heavenly bodies and calculate the awful velocity with which they are unceasingly wheeled through space, the mind is struck with solemn awe at the mighty power of the great Creator, who has made huge Jupiter to revolve once on its axis in ten hours, and through space at the rate of 4,685 miles an hour, or fifteen times the velocity of a locomotive running at the rate of 300 miles an hour.—*Scientific American.*

Rutland County Marble and Slate.—At the late Agricultural meeting at Rutland, Vt., Charles Shelton, Esq., of West Rutland, said that in 1850 there was quarried at West Rutland $190,000 worth of marble,—in 1853, $361,000 worth,—in 1854, probably $400,000 worth. From other towns in the county he thought that $200,000 worth of marble would be exported this year. The value of the marble sold is twice as great as the wool clip of the county in 1850. It exceeds the value of the wool and the dairy products of the county. At the West Rutland quarry, there are consumed annually 150 tons of hay, 6,000 bushels of potatoes, 6 tons of butter, and 6,000 bushels of corn. Of the value of the marble exported three-fourths is added to the wealth of the county.

The demand has always exceeded the supply. There is no fear of a decrease of the demand. To increase the supply, more capital should be invested in quarrying and sawing marble. Rutland can furnish, annually, marble to the amount of $1,500,000. He said that the quality of the slate in this county was equal to that of any part of the world.—It was inexhaustible in quantity, and the demand for it was far greater than the supply. He thought that this year, not less than $300,000 worth of slate would be quarried in Rutland county.

Patent Fuel.—A new business has recently sprung up in England, which has grown to some importance, in the manufacture of a fuel for steam and other purposes. This patent fuel is simply the refuse slack or coal-dust of the mines, which lies in immense quantities around all the collieries, nearly valueless. The process adopted is merely beating and pressing this dust into moulds or bricks, when the fuel thus produced is found quite equal in all respects to the coal from which it is produced, besides possessing advantages in compactness of stowage, etc., etc., which forms a recommendation for marine steam purposes.—In tropical climates, also, coal is found to lose a large per centage of bulk by the evaporation which is continually taking place, and it is during this period that the danger of spontaneous combustion which has occurred frequently, exists. The patent fuel, on the contrary, avoids this and retains its weight and strength in any climate. There ought to be a good field for the operations of a company for the same purpose on this side of the Atlantic.

Machinery the Power of Nations.—In our day that country which employs the greatest amount of the best machinery in every department of industry, is the most powerful. It was calculated ten years ago that Britain had manufacturing machinery in operation equal to the labor of four hundred millions of men.—Our own country is extensive in domain, fruitful in soil, varied in climate, and has one-fifth more inhabitants than Britain, and possesses natural resources surpassing those of all other nations. Its commerce floats on every sea, its inhabitants are ingenious, intelligent, and industrious, and its moral and physical power is second to no other nation. But without the great amount of useful machine power which our country possesses—those Briareus hands of iron which spin, weave, sow, reap, forge, grind, saw, plane, and hew—our country would not be powerful, though its inhabitants were twice as numerous, and its natural resources ten fold more abundant.

Steam Whistles, Bells and Fogs.—The Staten Island steamboats have been provided with steam whistles, for use in fogs. On Saturday morning the Staten Islander came up through a dense fog, whistling and tolling in rapid succession, with a sharp look out forward, and landed her passengers only ten or fifteen minutes behind time. She met the steamers Wyoming and John Potter, exactly in her track, and encountered half a dozen other vessels, but so admirable were the precautions that she passed alongside them without collision or risk. As sound can be heard only a short distance in fogs; the interval between each alarm should be very brief. Two steamboats one mile apart, each moving fifteen miles an hour, would strike in two minutes, and hence the importance of sounding the bell or whistle every quarter of a minute, as was done on the Staten Islander. The steam whistle can be heard farther than a common steamboat bell.—*N. Y. Courier.*

An Old Chronometer.—Captain Cook's chronometer has been presented to the United States Institution by Admiral Sir Thomas Herbert. It has undergone some adventures; after two voyages with Cook, Lieut. Bligh took it out in the Bounty; the mutineers carried it to Pitcairn's Island, where it was sold to an American, who sold it again in Chili; finally Sir Thomas Herbert bought it at Valparaiso, for fifteen guineas.

Substitute for Coal.—A cheap substitute for coal, it is said, may be prepared as follows:—One-third clay, one-third chopped straw, one-third coal dust, mixed together to a proper consistency, made into blocks, or similar to bricks; when dried in the sun, or other heat, it will become hard and suitable for burning in stoves, ovens, &c.

Hollow Axles for Railroad Cars.—The Reading, Pa., Steam Forge is making hollow axles for railroad cars, the first ever turned out on the continent. They have been scientifically tested, are not liable to fracture, can sustain more weight, and last longer than the solid axle.

Educational.

EXCELSIOR.

EMMA C. CARTER.

Unfurl the banner, let its folds
Float o'er our noble land,—
Proud Science's banner, starred with hope
And striped by Truth's pure hand.

Upon the widening field of mind,
There let this banner wave;
Marshal beneath it Learning's troops
With earnest spirits brave.

Break down the ranks of ignorance,
Ye heroes of the mind,
And fight till round thy victor brows
The laurel wreath is twined.

Raise up the standard, plant it high
On Knowledge's towering mount;
Lead up child-soldiers, let them drink
From Wisdom's gushing fount.

Go, bear this banner, Teachers, go,
With pure hearts, true and strong;
Let "Onward" o'er your motto be,
"Excelsior," your song.

INSTRUCTION IN SARDINIA.

The Italian correspondent of the Newark Advertiser writes as follows:—The annual report of the Sardinian Minister of Public Instruction, just presented to Parliament, furnishes good reason to hope that the means now employed to instruct the people of this kingdom, will ere long raise them above the dominion of superstitions. The four Universities of the State comprise at this moment over 3000 pupils, who are receiving instruction in all the higher branches of science and learning, which is a considerable increase since the last report. That of Turin has over 1,600 in the several departments of law, medicine, theology, physics, language, &c. The number of theological students has so remarkably diminished as to have excited general observation. There are but seven in the University at Turin, and only one in that of Genoa.—where a few years ago there were hundreds. The secondary schools immediately connected with the Universities, comprise, according to the report, over 12,000 pupils, pursuing the various elementary branches of learning. You will also be pleased to hear that common district schools are being established under the most flattering auspices, in portions of the country hitherto without the means of instruction.—*Connecticut Com. School Journal.*

MAKE YOUR PUPILS LOVE YOU.

After exploring the ground the first thing to be done, as a preparation for reforming individual character in school, is to secure the personal attachment of the individuals to be reformed. This must not be attempted by professions and affected smiles, and still less by that sort of obsequiousness common in such cases, which produces no effect but to make the bad boy suppose that his teacher is afraid of him; which, by-the-way, is, in fact, in such cases, usually true.

A most effectual way to secure the good will of a scholar is to ask him to assist you.—The Creator has so formed the human heart, that doing good must be a source of pleasure, and he who tastes this pleasure once will almost always wish to taste it again. To do good to any individual, creates or increases the desire to do it.

Another means of securing the personal attachment of boys is to notice them; to take an interest in their pursuits, and the qualities and powers which they value in one another. It is astonishing what an influence is exerted by such little circumstances as stopping at the play-ground a moment, to notice with interest, though perhaps without saying a word, speed of running or exactness of aim; the force with which a ball is struck, or the dexterity with which it is caught or thrown.

Henry Clay's Letter to Children.—The Richmond (Va.,) *Penny Post* contains the following characteristic letter, written by the late Henry Clay to the children of a gentleman of that city. It has never before been published, not having been written with that purpose:

Washington, Feb. 18, 1838.—My dear children: Having made the acquaintance of your father, and received from him many acts of kindness, I take pleasure, in compliance with his wishes, in addressing these lines to you.—During a long life, I have observed that those are most happy who love, honor and obey their parents; who avoid idleness and dissipation, and employ their time in constant labor, both of body and mind; and who perform, with regular and scrupulous attention, all their duties to our Maker, and his only Son, our blessed Saviour. May you live long and prove a blessing to your father and mother, ornaments to society, and acceptable to God.—Such is the hope of your father's friend, and although unknown to you, your friend,

H. Clay.

The Age to begin School.—Children are generally sent to school too young. This is the testimony of all experienced teachers.—Children sent to school at four years of age, and those sent at seven will be, in almost all cases, equally advanced at nine, with the advantages for future progress all in favor of the latter. Thousands of young minds are stunted and permanently dwarfed, by too early application to study, and thousands of young hearts receive an ineradicable taint of moral corruption by too early exposure to the evil influence unavoidably found in a promiscuous gathering of elder children.—*Mich. Jour. of Education.*

Indulging in dangerous pleasures, is like licking honey from a knife, and getting cut with the edge.—*Burmese Proverb.*

The Essayist.

BUSINESS THE CHARM OF LIFE.

No passion is more ruinous than "the haste to be rich." It is condemned alike by revelation, reason, and sound practical experience of life. It leads men into unsafe and ruinous speculation; it seduces them from fast anchored property to the mirage that glitters. It allows the hands of industry and employment to stand still on the dial-plate of life, while men grasp at shadows. It is this passion that separates the business past from the business present by so wide a gulf.

The modern merchant, with small capital, and that, perhaps, not his own, with his granite store, his mahogany desk, his country seat, fast horse, and rash speculations, scorns the example of his sire, who at his desk of pine and baize, sat each day sixteen mortal hours at his business, doing his own errands, and being his own clerk. With so wide a contrast it is not strange that so many begin business where their sire left off, and leave off where their sire began.

It is employment we all need—employment till life shall end. The plowboy is happy in his furrow, and the hours pass swifter than the weaver's shuttle, while the matron and maid sing amid their daily duties. No success and no wealth can make that man happy who has nothing to do. We have seen a boy grow up to the full stature of manhood, take his stand by the side and as one of our richest men; his elegant city residence and suburban abode became the envy of men—his horses and equipage the most perfect in our midst. We have seen him, with his fortune made, bid adieu to the toils and vexations of business, take the balance of his life to himself, and resolve to be happy at his ease. We have watched him in his elegant retreat, possessed of "more than heart can wish," After a few years we have sought and found him not, learning, with sorrow, that, not able to endure a life of leisure and ease, he had gone unsalled for into the presence of his Maker.

An eminent merchant of Boston, when asked why he did not quit his business, as his fortune was ample, replied, "that his repose would be his death." We know well that the spring of enjoyment would dry up, and soon, with inactivity, life would become a burden.—The celebrated commentator, Dr. McKnight, completed his work on the epistles when not far from sixty years of age. Nearly thirty years of his life had been occupied with that great labor. His employment had been regular and cheerful, and the purple current of his life had flowed painlessly and joyously along. He refused to go on with his Gospel as he had earned his respite, he said. His faculties were in their usual vigor. In leaving his regular employment his mind soon lost its tone, and he sank almost into a driveling idiocy. Had he continued his employment, a mellow and a green old age would have been his portion, and his sun gone down at last with unclouded splendor.

It is employment that has made us what we are. Our sky is inclement, our soil hard and tough; but the sun shines on no land where so many people enjoy so much substantial good. The alchemy of labor can turn our ice into gold and our rocks into bread. Employment given to millions of Europe now indolent and hungry, would quench many a volcano and put down misrule and insubordination. It was Lord Bacon, I think, who said that "all rebellions commence in the stomach." Let a nation be both destitute and idle, and it would not be strange if they were to become turbulent also. Sodom had three great sins; one of them was "an abundance of idleness." Palestine, in the time of Solomon, contained a nation of men who were daily employed, and a race of women who could both "clothe their households with scarlet," and "consider a field and buy it."—These were the days of Israel's prosperity. Gold and silver were abundant; the mountains were terraced up to their summits, and the valleys were but beds of vegetation. It is now a land of indolence. The same sky is above the people, they tread the same soil beneath their feet; but all is desolate, because all are indolent. The owl and the cormorant sit now in the palaces of David and Solomon. When men were proud to say, "I am a Roman citizen!" Rome was governed by Emperors whom she called from the plow. They led her invincible legions to conquest. Now indolence broods over the whole land of the Cæsars like the miasma over the whole pleasant home of man—desolation and ruin are seen on all sides.

We should be glad to address you on many other topics which will, and must enter into your business prosperity. That courtesy to all, based on principle, that costs so little and yields so large a return; that courage and business faith that will not only make you enterprising and far-seeing, but enable you to be singular and odd even, when duty calls or danger is to be avoided; that regard for your word that will command credit; that high moral character which will make your word as good as your bond; that integrity that will induce you to meet with imputation sooner than repudiation, and cause you to select some other road to fortune than that of defrauding your creditors, that principle without which no smartness, no talent will avail; but these and all other things by them suggested, must be left to your own thoughts and your own application, and so also must that certain success that will attend the application to the business of life.—*Hunt's Merchant's Magazine.*

What is a mountain? It is to one man a mine, where a treasure may be hid; to another, pasturage for flocks, or a site for a house; to an artist, it is chrome lake, yellow ochre, burnt sienna, and indigo; to the geologist, it is trap, quartz, schist, limestone, sandstone, hornblende, silex and the like; to the poet, it is a temple and a throne, an oracle of pines, a ladder for angels, a landing-place for Mercury. To most men, it is a mountain—nothing more.

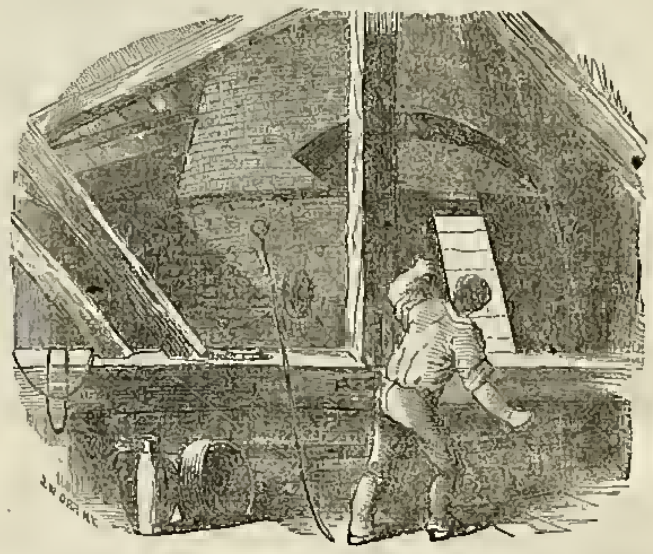
STONE-WARE MAKING.—THE KILNS.

THE MANUFACTURE OF POTTERY.

(Concluded from page 360.)

After the ware has been moulded or turned, it is subjected to a drying process, either of exposure to the sun or by means of artificial heat. If now the vessels were burned in this condition, they would be so porous as to permit liquids easily to ooze through them, and in this way cups used in the manufacture of galvanic batteries are formed. To render the ware impervious to liquids, the surface is washed in a solution containing the constituents of glass, which, when subjected to the action of fire, melts and covers the whole vessel with a vitreous surface.

The kilns in which the ware is burned are generally of a circular form, varying from nine to fourteen feet in diameter, and from ten to eighteen feet high. The fire-holes, from five to eight in number, according to the size of the kiln, pass through the thickness of the brick work, and are placed at regular distances from each other. After the kiln is filled the doorway is bricked up, fire applied to the furnaces, and the heat gradually increased until the ware is found to be properly burnt, which usually requires about two days and nights. During the process of burning, the man in attendance continually looks into the kiln, through sight-holes, in order to see whether the fires are burning alike, and thus keeping an equality of heat through his kiln; when he considers it nearly finished, he draws trials through a hole in the doorway, until he finds the glaze melted and bright, which shows him the kiln is finished; whereupon the fires are allowed to go down.



STONE-WARE MAKING.—THE KILN.

CONVERSATION.

If you would wish to learn all about a man's birth, life, occupation, habits, and associations, you have only to talk with him. If he is a sportsman, the second sentence—if not the first—will be race horses, dogs, guns, grouse and snipe shooting; and ten to one he will give you an account of his success in bagging game and cunning in foremost on the race course. If you happen to get into the company of a clergyman, you are sure to have a little theology wedged into the conversation, and every one of his assertions, whether truth or its opposite, will be clinched with a rivet from Scripture.

A lawyer's ideas are all "situate, lying and being" between the covers of Blackstone's Commentaries and law reports; and rarely soar beyond the foggy and mystified regions of mortgages and red tape. A school teacher—that is, a regular knight of the birch—rarely has an idea outside of the comic sections, algebra and arithmetic, and looks upon his ferule as the great Archimedian lever that is to elevate the world to the highest pinnacle of its destiny; while his empire is disputed by nobody but the dry nurse who has the advantage of forming the young idea after all. To the little urchins, however, among whom he stands—like Gulliver among the Lilliputians—he is a very important personage, if to nobody else.—The doctor, like the rest, has but one string to his violin, and on that he is always harping the same old tune of emetics, powders, pills and boluses, and the best remedies for measles and marasmus.

You can find out a young lady's character by the same means. If she talks of the last sleigh ride, the latest kind of ribbon imported, boasts of the number of balls she has attended during the season and discourses of the last novel issued, she may be a pretty ornament to a parlor, but never will be useful for any purposes of practical utility. The cause of the insipidity of modern conversation is that most people have but one class of ideas on which they can prattle for an age; but if you introduce another subject they flounder like a fish on dry land. Of all bores and penalties of boredom, deliver us from the man of one idea and his monotonous and everlasting reiteration of it. The man of general information is never tiresome; but he who fancies that because he is interested in some little narrow mental trend-mill, everybody else must be interested in it also, and bores them accordingly, ought to be hung up in a cage with a parrot where they could not chatter away without torturing others of a wider range of ideas than themselves.

Be quick in resolving, and bold and determined in executing.

CELEBRATED ENGLISH OAKS.

An English paper gives the following account of the most celebrated oaks in England:

The oldest oak in England is supposed to be the Parliament Oak (from the tradition of Edward I. holding a parliament under its branches) in Clipstone Park, belonging to the Duke of Portland, the park being also the most ancient on the island; it was a park before the conquest, and was seized as such by the conqueror. The tree is supposed to be 1500 years old.

The tallest oak in England is supposed to be the property of the same nobleman; it was called the "Duke's walking stick," was higher than Westminster Abbey, and stood till of late years.

The largest oak in this country is called Cuthorp Oak, Yorkshire; it measures 78 feet in circumference where the trunk meets the ground.

The "Three Shire Oak," at Worksbop, was so called from its covering part of the counties of York, Nottingham, and Derby. It had the greatest expanse of any recorded in this island, dropping over 767 square yards.

The most productive oak was that of Gelonos, in Monmouthshire, felled in 1810. Its bark brought £200, and its timber £670.

In the mansion of Tredegar Park, Monmouthshire, there is said to be a room 42 feet broad, and 227 feet long, the floor and wainscots of which were the production of a single oak tree, grown on the estate.

Ant's Nest.—There is in Australia a species of ant, which builds its nests in trees by bending down several adjacent leaves and glueing them together in the form of a purse. Says Hawksworth, in his account of Cook's first voyage:—"Their method of bending down the leaves we had no opportunity to observe, but we saw thousands uniting their strength to hold them in this position, while other busy multitudes were employed within, applying the gluten that was to prevent their returning back. To satisfy ourselves that the leaves were sent and held down by the efforts of these diminutive artificers, we disturbed them in their work; and as soon as they were driven from their stations, the leaves on which they were employed sprang up with a force much greater than we could have thought them able to conquer by any combination of their strength; but, though we gratified our curiosity at their expense, the injury did not go unrevenged, for thousands immediately threw themselves upon us, and gave us intolerable pain with their stings, especially those which took possession of our necks and hair, whence they were not easily driven."

Sunday Reading.

[Written for the Rural New-Yorker.]

DEATH OF THE YOUNG.

I saw him when the glowing tints of health
Threw over neck and brow a roseate hue
Which lingered long upon the rounded cheek,
And delicate, curved lip.

A sunny smile
Was often on his face, yet oftener still,
The language which his beaming eye gave forth,
Breathed of another world. O, who will say
That that young spirit had not, even then,
Heard strains of music from the heavenly shore—
Seen angel forms, and heard angel whisperings
Of "Home in Heaven." Too fair he seemed for death,
Yet that dread spoiler loves the beautiful;
Not even childish innocence can stay
The hand of the destroyer.

Disease came
With wasted, hideous form, and sick'ning breath,
And in her talon-fingers held a worm
With which to gnaw the hidden cords of life,
And fright the soul to wing its flight to Heaven.
Friends wildly wept, and oh! how wildly prayed;
Vain were their tears, yet were not all in vain
Their agonizing prayers, for Heaven that claimed
An angel, showered drops of balm upon
Each mourners heart.

Ere many days had passed,
I saw that childish form wrapped in its shroud,
A heavenly smile was wreathing the pale lip,
As if the happy spirit lingered long
O'er its deserted clay.

Say, what is Life,
That e'en the slightest breath of pale disease
May lay the fairest form low in the dust.
And yet, O, Death! destroyer as thou art,
Thou can'st not blight the soul.

Gerry, N. Y., November, 1854.

SPEAK IT BOLDLY.

Be thou like the first apostles;
Be thou like heroic Paul;
If a free thought seeks expression,
Speak it boldly—speak it all!

Face thine enemies, accusers;
Scorn the prison, rack, or rout!
And if thou hast a truth to utter,
Speak! and leave the rest to God.

[Written for the Rural New-Yorker.]

THE TIME TO PRAY.

When morning light dispels the shades and again reveals the earth decorated with the handiwork of the Creator, when the first beams of the sun render the dewdrops more sparkling than the brightest gems, the pure atmosphere tints the cheek with roseate hue, and we feel that the weariness of yesterday is exchanged for strength and buoyancy of spirits,—when we feel that through the defenceless hours of slumber guardian angels have watched over us, and when all animate creation, refreshed by nature's balm for the weary, are praising their Creator with a thousand harmonious notes, *then* is the time to pray.

When sombre night rests upon the earth, hushing all nature to silence, and we feel that during another day a merciful Providence has been our protector, that our wants have all been supplied from His bounties,—when that best hour for reflection, evening twilight, brings to mind our many transgressions and His innumerable mercies,—when the hour of rest invites us to repose, *then* is the time to commit ourselves into the hands of God; yes, *then* is the time to pray.

When overwhelmed with adversity, friends forsake and future prospects are darkened,—when clouds of affliction shroud our brightest hopes in gloom, loved ones are torn from our fond embrace, the mouldering earth covers all that we hold most dear, and our hearts are wrung with anguish, *then*, would we find sweet relief, we must seek it in prayer. The listening ear of the Saviour is ever open to our requests. His words of comfort and consolation fall upon the wounded heart like gentle showers of summer upon the thirsty flower, reviving its drooping petals, restoring its fragrance and giving it new life and beauty,—yes, when sorrow is ours, *then* is the time to pray.

Yates, Orleans Co., N. Y. Lilly.

MYSTERIOUS PROVIDENCES.

One man sucks an orange, and is choked by a pit; another swallows a penknife and lives; one runs a thorn into his hand, and no skill can save him; another has a shaft of a gig driven completely through his body, and recovers; one is overturned on a smooth common and breaks his neck; another is tossed out of a gig over Brighton Cliff and survives; one walks out on a windy day and meets death by a brickbat; another is blown up in the air, like Lord Hatton in Guernsey Castle, and comes down uninjured. The escape of this nobleman was indeed a miracle. An explosion of gunpowder, which killed his mother, wife, and some of his children, and many other persons, and blew up the whole fabric of the castle, lodged him in his bed on a wall overhanging a tremendous precipice. "Perceiving a mighty disorder, (as well he might) he was going to step out of his bed to know what the matter was, which if he had done, he had been irrevocably lost; but in the instant of his moving a flash of lightning came and showed him the precipice, whereupon he lay still till people came and took him down.

Persecution.—As long as the waters of persecution are upon the earth, so long we dwell in the ark; but where the land is dry, the dove itself will be tempted to a wandering course of life, and never to return to the house of her safety.

Miscellaneous.

[Written for Moore's Rural New-Yorker.]

"GIVE HER A KIND WORD, LIZZIE."

She crossed our path—a ragless one,
In soiled and tattered dress—
And quick the glancing eye might read,
A tale of wretchedness—
Of childhood's chilo and cheerless home—
Of penury's scant fare—
And that neglected girl, methought,
Had known no mother's care!

With faded basket on her arm,
She moves with weary tread,
And as a city's jostling throng,
To win her daily bread!
The golden fruit she proffers now,
With timid voice and eye,
And pausing at our side she spoke—
"Please ma'am, an orange buy?"

Yet when, with light and careless speech,
We half had turned away,
A friend, more thoughtful, listened there—
And gently whispered—"Nay,
With kind words Lizzie cheer her on!"
And in that hand meanwhile,
The glittering coin he placed—and won
Her glad and grateful smile!

True utterance of a noble heart!
Thy noblest promptings thrill!
Our spirit fully breathed response,
Unto each generous word!
Yes! *kind words* for the desolate!
Though princely gifts fall free,
Like that rich sweet dew on desert flower,
Thine earnest *sympathy!*

West Bloomfield, 1854. MARIANNA.

[For the Rural New-Yorker.]

"MOVERS."

There they go! What a string of them!—Don't you see them going down the street?—Well, dear eastern reader, perhaps you enquire what kind of objects are designated by the term above; we answer negatively. We do not mean Rochester knocking or German *Table-movers*—and not they are a very different class from this. Neither do we speak of *Moving movers*, such as ye drillers in cities wot of.

No, nothing of the sort, but a peculiar people; a race, differing entirely from any other to be found in any other part of the world, but corresponding for the nonce, more nearly with the English gypsies than with any other people. They are the "movers" of the West who cross the broad and beautiful Prairies, and anon wind slowly through shadowy groves, and there, as here to-day, follow the main road through the centre of some young busy-growing ville, and emerging again upon the opposite side, continue their journey on, still on, far, far into the great West.

See! there comes another string of wagons; in this company there are four loads; now we shall have a fine view of them; stand here beside me on the door-step, and as they pass, I will point out a few of the peculiarities of this unique race.

Notice their wagons. They are usually painted either dark blue or red, but sometimes green. The front and back run up rather higher than the sides, something like an old fashioned Pennsylvania wagon, but they are not as large, nor do they have as broad tired wheels as those huge vehicles. A covering of common brown sheeting stretched over hoops, extends over the entire length of the wagon, but as the mover very seldom, if ever, spends time or money in painting or oiling this cover, it affords but a poor protection in a heavy rain, and has a whitey-brown, tent-like appearance, quite singular when seen moving over the prairies.

At the back end is invariably hung a box about a foot wide, of the same depth and as long as the width of the wagon. This box is used at every encampment as a feed-box for the horses, and over it you will notice on every one of the hundreds of wagons that pass here in the course of a few weeks, are sticking, bottom side up, a couple of round-posted, splint-bottom chairs, used at stopping-places as seats for the weaker and gentler members of the family.

From the front of yonder wheeled ark, peering out from beneath the sheeting cover, you will notice the wife and two youngest children. The wife drives the team, and as she sits there in her old sun-bonnet, and faded calico dress, with her yellow face and sharp black eyes she looks like nothing else so much as a Gypsey Queen.

Along by the side are running three barefooted girls, also with old sun-bonnets and faded calico dresses similar to those of the mother, but rather more besoiled.

In the rear of the caravan the men of the party, with the assistance of the boys, are driving along six or eight cows and about the same number of steers, heifers, and calves, all in pretty good flesh and looking very well for cattle who have traveled so many hundred miles. This is easily accounted for when we remember how fine the feed is in this prairie land, in the fall of the year, and by what easy stages the journey was accomplished.

The fathers and sons you will notice, are dressed in coarse, probably homespun clothing, and have that sunburnt, *lean* look so peculiar to the "mover." The favorite team with these nomads seems to be a span of pretty good horses, as we notice that such is the motive power of each of the wagons of the party passing before us; although we occasionally see one, two, three, and even four yoke of oxen plodding along.

The latter are plenty fast enough for the "mover's" time-table, as the driving of the drove of cattle behind precludes the attainment of a very great degree of speed, so the "mover's" horses are hardly, if ever, urged into a trot, but keep on the even tenor of their way, "Westward Ho!" with a slow and measured pace.

At night the "mover" finds some convenient spot where water can be obtained; as for pasturage that is found in abundance almost everywhere; the horses are unharnessed and hitched at the rear of the wagon, the feed-box is replenished, a fire lighted, the kettle swung, and now, man, wife, boys and girls, the cattle, horses, and the old watch-dog each get their share of "mid and comfort."

The wagons are the sleeping apartments of the family, and who shall say that as sweet sleep and light hearts are not found beneath these folds of brown sheeting, as the halls of the affluent can boast?

But look! On the side of one of these wagons is inscribed with red chalk, in large but rather irregular letters, "Iowa;" this marks their destination. The "movers" seem fond of this kind of advertising, and just now the current seems to be changing a little, as we often see "Nebraska" or "Kansas" indicated as the future home of the "mover."

And thus the western slope of this vast, bright, beautiful, rich Mississippi valley is filling up. The "movers" come dropping along like rain; New England's hardy sons come in brotherly bands; Germans come by districts; Englishmen come by families, and generally large families; Irish come a whole nation!—These, with a considerable sprinkling of other foreigners, and not a few Southerners, are now laying the foundation of the great, central, and most powerful empire of the world.

This vast, rich, alluvial territory, with advantages of inland navigation unequalled in the world, with the indomitable Anglo-American spirit, as the back-bone and strength of its vast population, who shall tell its destiny in the future? E. M. P.

Bloomington, Ill.

THE TEST OF A GENTLEMAN.

The forbearing use of power does not only form a touchstone; even the manner in which an individual enjoys certain advantages over others is a test. The power which the husband has over his wife—in which we must include the impunity with which he may be unkind to her—the father over his children, the teacher over his pupils, the old over the young, and the young over the aged, the strong over the weak, the officer over his men, the master of a vessel over his hands, the magistrate over the citizen, the employer over the employed, and educated over the unlettered, the experienced over the confiding, the keeper of a secret over whom it touches, the gifted over the ordinary man—even the clever over the silly—the forbearing and inoffensive use of all this power or authority, or a total abstinence from it, where the case admits it, will show the gentleman in a plain light.

Every traveler knows at once whether a gentlemanly or rude officer is searching his trunk. No gentleman can boast of the delights of superior health in the presence of a languid patient, or speak of good luck within hearing of a man bent by habitual misfortune. Let a man who happily enjoys the advantages of a pure and honest life speak of it to a fallen, criminal fellow being, and you will soon see whether he be, in addition to his honesty, a gentleman or not. The gentleman does not needlessly and unceasingly remind an offender of a wrong he may have committed against him, he cannot only forgive—he can forget; and he strives for that nobleness of self and mildness of character, which imparts sufficient strength to let the past be truly the past. He will never use the power which the knowledge of an offence, a false step, of an unfortunate exposure of weakness given him, merely to enjoy the power of humiliating his neighbor. A true man of honor feels humbled himself when he cannot help humbling others.

Wood Fires.—In many a green valley of New England there are children yet; boys and girls are still, to be found not quite overtaken by the march of mind. There, too, are huskings, and apple-bees, and quilting-parties, and huge old-fashioned fire-places piled with crackling walnut, flinging its rosy light over many countenances of youth, and scarcely less happy age. If it be true that, according to Cornelius Agrippa, "a wood fire doth drive away dark spirits," it is nevertheless also true that around it the simple superstitions of our ancestors still love to linger; and there the half-spiritful, half-serious charms of which I have spoken are oftenest resorted to. It would be altogether out of place to think of them by our black, unsightly stoves, or in the dull and dark monotony of our furnace-heated rooms. Within the circle of the light of the open fire safely might the young conjurers question destiny; for none but kindly and gentle messengers from wonder land should venture among them.—*J. G. Whittier.*

I have always heard it said, that to confer benefits on the base minded is like throwing water into the sea.—*Cervantes.*

A STORY OF THE NORTH.

The interest with which the recent discovery of the fate of the party of Sir John Franklin has invested all the old stories and traditions of adventure in the Arctic seas, renders the following narrative of the fate of Errick Rande peculiarly interesting and appropriate at the present time:

"As early as 988 Errick Rande, an Icelandic chieftain, fitted out an expedition of twenty-five galleys at Suefell, and having manned them with sufficient crews of colonists, set forth from Iceland to what appeared a more congenial climate. They sailed upon the ocean fifteen days, and they saw no land. The next day brought with it a storm, and many a gallant vessel sank in the deep. Mountains of ice covered the water as far as the eye could reach, and but a few galleys escaped destruction.—The morning of the seventeenth day was clear and cloudless: the sea was calm, and far away to the Northward could be seen the glare of ice-fields reflecting on the sky. The remains of the shattered fleet gathered together to pursue their voyage, but the galley of Errick Rande was not there.

The crew of a galley which was driven further down than the rest, reported that, as the morning broke, the large fields of ice that had covered the ocean were driven by the current past them, and that they beheld the galley of Errick Rande, borne by resistless force, and with the speed of the wind, before a tremendous field of ice—her crew had lost all control over her—they were tossing their arms in wild agony. Scarcely a moment had elapsed before it was walled in by a hundred ice hills, and the whole mass moved forward and was soon beyond the horizon. That the galley of the narrators escaped was wonderful—it remained, however, unrontrolled, and the vessel of Errick Rande was never more seen. Half a century after that, a Danish colony was established upon the Western coast of Greenland. The crew of the vessels which carried the colonists thither, in their excursions into the interior, crossed a range of hills that stretched to the Northward; they had approached nearer to the pole than any preceding adventurers.—Upon looking down from the summit of the summit of the hills, they beheld a vast and interminable field of ice, undulating in various places and formed into a thousand grotesque shapes.

They saw, not far from the shore, a figure in an ice vessel, with glittering icicles instead of masts rising from it. Curiosity prompted them to approach, when they beheld a dismal sight. Figures of men in every attitude of woe upon the deck, but they were icy things; one figure alone stood erect, and, with folded arms, leaning against the mast. A hatchet was procured and the ice split away, and the features of a chieftain disclosed, pallid and deathly but free from decay. This was doubtless the vessel, and that figure the form of Errick Rande. Benumbed with cold, and in the agony of despair, his crew had fallen around him. The spray of the ocean and the fogs had frozen as it lighted upon them, and covered each figure with an icy robe, which the short-lived glance of a Greenland sun had not time to remove.—The Danes gazed upon the spectacle with trembling. They knelt down upon the deck, and muttered a prayer in their native tongue for the souls of the frozen crew, then hurriedly left the place, for the night was approaching."

A MODERN DICTIONARY.

Public Abuse—The mud with which every traveler is spattered on the road to distinction.

Distant Relations—People who imagine they have a claim to rob you if you are rich, and to insult you if you are poor.

Belle—A beautiful, but useless insect without wings, whose colors fade on being removed from the sunshine.

Heart—A very rare article, sometimes found in human beings. It is soon, however, destroyed by commerce with the world, or else becomes fatal to its possessor.

Housewifery—An ancient art, said to have been once fashionable among young girls and wives; now entirely out of use, or practiced only by the "lower orders."

Wealth—The most respectable quality of the man.

Virtue—An awkward habit of acting different from other people. A vulgar word. It creates great mirth in fashionable circles.

Honor—Shooting a friend through the head, whom you love, in order to gain the praise of others, whom you despise.

Friend—A person who will not assist you because he knows you will excuse him.

State's Evidence—A wretch who is pardoned for being baser than his comrades.

Sensibility—A quality by which the possessor, in attempting to promote the happiness of other people, loses his own.

Judge Not.—If you wish to be loved as a companion, ignore all unnecessary criticism upon your associates. The number of those who have taken out judges' patents, is very large in society, and they all drive a prosperous business. But no one chooses to live between the glasses of a microscope, even tho' a fool be looking in. One of the most vexatious kinds of criticism is that back-handed variety which commences with such introductions as these: "Had I been consulted," "had you listened to me," "you always have your own way," and a legion of such like expressions which are not designed to soothe a perturbed spirit.

It is not pomp or pretension, but the adaptation of the expression to the idea that clenches a writer's meaning—as it is not the size or glossiness of the materials, but their being fitted each to their place, that gives strength to the arch.

God pity the man who has nothing to do.—Idleness is the mother of more misery and crime than all other causes ever thought or dreamed of by the profoundest thinker, or the wisest theorist.

Ladies' Department.

CONDUCTED BY A——E.

WILL YOU LOVE ME? I LOVE YOU!

BY ALLIE VERNON.

Flowers love the sunbeams bright,
Murmuring brooks, the moon's pale beam;
Wild birds hail the morning light,
Poets love in jolly dream.
Waving branches love the breeze,
Drooping blossoms love the dew,
Autumn loves the falling leaves,
Will you love *me? I love you!*

Earth receives the summer rain,
With a loving, grateful breast;
Sad hearts love the simple strain
That in childhood pleased them best.
Wanderers love to think of home,
Painters love fair scenes to view;
Sea-nymphs love the dancing foam,
Will *you* love *me? I love you!*

THE WORSTED STOCKING.

A TRUE STORY.

"Father will have done the great chimney to-night, won't he mother?" said little Tom Howard, as he stood waiting for his father's breakfast, which he carried to him at his work every morning.

"He said he hoped all the scaffolding would be down to-night," answered his mother, "and that'll be a fine sight; for I never like the coiling of those great chimneys—it's so risky—thy father's to be the last up."

"Eh, then, but I'll go and see him, and help 'em to give a shout before he comes down," said Tom.

"And then," continued his mother, "if all goes right, we are to have a frolic to-morrow, and go into the country, and take our dinners, and spend all the day amongst the woods."
